you called it, were used, and separate those from the ones you called the Bowman containers that were used?

A. It does not show on this particular report, but on the first page of this report it describes the technique. I believe they are referred to on that.

Mr. Gariepy: Mr. Schaefer, have you the first page that he is referring to?

Mr. Schaefer: Is that what you mean, Mr. Rudig (handing document to the witness)?

The Witness: Dean's plaques.

Mr. Gariepy: Q. How many of those on Exhibits 20 and 21? You have just said here, under Dean's plaques that you referred to, that they were sterilized in an autoclave for one hour at 15 pounds pressure on two successive days. How many of those?

A. All of them.

Q. And you have got on this table plus or minus signs. What does that mean with regard to the number of bacteria?

1695 A. It doesn't have anything to do with the number.

Q. You didn't count them?

A. This test was put in broth, you see. You could not tell the number.

Q. You could not tell the number?

A. In other words, this means one organism present or two or three or fifty, it would show the same result.

Q. And if there were one, two or fifty, or a million, the plus would show that?

A. Yes.

Q. And if there was none, it would be zero?

A. Yes.

Q. But no accurate count was made?

A. Not in this test. Let us see about this. On 17, no, but on 16 there were some counts made to show the number of organisms, approximately; this particular one.

Q. Exhibits 20 and 21, which are the ones I asked you about concerning the effect of plus and minus?

A. Yes.

Mr. Gariepy: That is all, Mr. Rudig.

The Master: Is that all, Mr. Schaefer?

Mr. Schaefer: Yes. I offer in evidence Defendants' Exhibits 20 and 21.

Mr. Gariepy: Master, I object. There is nothing show-

ing that Exhibits 20 and 21 apply to the Pure-Pak
1696 container of the plaintiff here, except as this witness said he could not point them out and there is nothing in here showing the amount of bacteria. It is just plus and minus. It might be one or a million. It is immaterial. I don't see anything to it.

The Master: Well, I will let them go in. Objection overruled.

(Said documents, showing experiments Nos. 16 and 17, as conducted by the witness, so offered and received in evidence were marked DEFENDANTS' EXHIBITS 20 and 21, respectively, and are attached hereto and made a part hereof.)

The Master: Q. By the way, did you encounter any difference, Mr. Witness, between the two types of plaques, Dean's and Bowman's, in the results that you obtained?

A. No. For experimental purposes all of these paper plaques gave about similar results. Those that were extracted with ether or not extracted with ether, as far as paraffin is concerned, it made no difference.

Q. It made no difference whether you had the Dean paper or the Bowman paper?

1697 A. No.

Mr. Gariepy: Q. Mr. Rudig, since the Master asked you that question, how do you account for any growth of this bacteria on these plaques?

A. The only answer is that they were not killed when they were exposed in the paraffin bath twenty seconds at 170 degrees Fahrenheit.

Q. But if I told you that these plaques were made out of paper board that was sterile and free from bacteria, how would you account for it?

A. If they were sterile, they would not grow or come through.

Q. You inoculated them, didn't you?

A. Some of them, but we ran some controlled ones that were not inoculated.

Q. Do you mean to tell me you took these plaques and performed these tests without doing any inoculation on them at all, and just made the count after immersion in water?

A. We made the count to prove they were sterile after the test.

Q. In the beginning?

A. After they were autoclaved.

Q. What do you mean by that?

A. Subjected to 15 pounds pressure, in closed ves-
1698 sels, under steam heat.

Q. Do you know whether these parcels of board had any greater pressure on them than this 15 pounds of heat that you refer to?

A. No, that is the only time.

Q. If I told you they were under rollers at 250 degrees Fahrenheit, with pressure on them, steam rollers, would you still say there were bacteria on this paper board?

Mr. Schaefer: I object to that. He is not a bacteriologist on paper.

Mr. Gariepy: He is too.

The Master: I think I will sustain the objection. That is argumentative. He has merely given you the results of the tests that he conducted. You can argue about that later on.

Mr. Gariepy: Q. You don't know anything about the making of these plaques or these parts of paper board that you made this from, do you?

A. No. I am not a paper man and I did not go into that.

Q. Did you have any occasion to check into the making of this board?

A. No, I did not.

Q. Or any other type of paper container?

1699 A. No. There was no necessity for it, with this type of experiment, at least.

Q. Why?

A. My problem is one to express whether or not this paper, the same in both instances, whether wet or dry, would show a certain result. That was all my problem was. The paper was the same in both cases. We used the same paper. All those plaques were selected at random. The paper was the same all the way through. It didn't matter whether it was a wet one or a dry one. The problem was what would be the effect on the wet or the dry paper. It was all the same material to begin with.

Q. But you inoculated them?

A. Yes, some of them, and the controls, as I mentioned in there and showed in the report, were negative and showed sterility, or the death of bacteria.

Q. How do you account for the death of the bacteria on the dry and wet?

A. I suppose the moisture there has a greater sterilizing effect than the dry. That would be the common assumption, I believe, from looking over the report.

Q. Do bacteria grow where it is moist or where it is dry?

A. That depends on conditions. Ordinarily organisms have to have moisture.

1700 Q. Is it not a fact that bacteria will not grow unless they have something to feed on in the way of moisture?

A. Yes, they have to have food and moisture, yes.

Q. And where there is no moisture and no food, how are they going to exist?

A. They do get moisture to a certain extent, to exist.

Q. That is from the air?

A. To a certain extent, but it might be from the medium.

Q. You refer to the plaque?

A. No.

Q. Just taking a plain plaque, where are they going to exist, if the plaque is devoid of moisture?

A. It is not entirely devoid of moisture. It has been in the oven. That took a certain amount of moisture out of it. Whether it is completely dehydrated, I do not know.

Q. But you did not perform any test to ascertain that?

A. No. But you could see readily here that paper board subjected to dry heat would become dryer than one sitting in a moist container. I think you can assume that.

Q. This test that you performed, then, was not designed as a test in order to show the bacteria on the original board, was it?

1701 A. No. In other words, the inoculation there did not make a great deal of difference. That was not the problem.

Q. It was only performed for the purpose of showing the relative killing effect of the bacteria in the paraffin?

A. Yes.

Q. But the quality of the board was not concerned?

A. No.

Q. This was an artificial test you set up in order to ascertain the effect of this paraffin?

A. That is right.

Q. You don't know anything about the paper board being actually used in paper bottles being subjected to the same type of test and inoculation, do you?

A. I don't know to what test they would be subjected in the plant.

Mr. Gariepy: That is all.

Mr. Schaefer: That is all.

(Witness excused.)

Mr. Schaefer: Mr. Reporter, will you mark this Defendants' Exhibit 22 for identification?

(The document referred to was thereupon marked by the reporter Defendants' Exhibit 22 for identification.)

1702 Mr. Schaefer: It is stipulated between the plaintiff and the defendants in this case that the letter which has been marked Defendants' Exhibit 22 is a true copy of a letter sent by Mr. S. E. Dean, Sr., president of the Dean Milk Company, to Dr. Herman N. Bundesen, on or about January 13, 1936, and received by Dr. Bundesen.

Is that correct?

Mr. Gariepy: That is right.

Mr. Schaefer: I offer Defendants' Exhibit 22 in evidence.

Mr. Gariepy: I can't quite see the purpose of this, Master, when we have already stipulated that application was made on that date by the Dean Milk Company, that subsequent thereto the Fieldcrest Dairies made application, adopting this application that had heretofore been made, and that subsequent thereto numerous correspondence passed. I typed all this correspondence, about 56 letters, and gave it to Mr. Schaefer.

The Master: This does not hurt you.

Mr. Gariepy: But I don't want any part of it in. Put it all in.

The Master: I will let it go in. It may be received.

1703 (Said document, being a photostatic copy of letter dated January 13, 1936, to Dr. Herman N. Bundesen, from the Dean Milk Company, so offered and received in evidence, was marked DEFENDANTS' EXHIBIT 22 and is attached hereto and made a part hereof.)

The Master: Anything more, Mr. Schaefer?

Mr. Schaefer: Yes, sir, one more exhibit.

Mr. Reporter, will you mark this Defendants' Exhibit No. 23 for identification?

(The document referred to was thereupon marked by the reporter Defendants' Exhibit 23 for identification.)

Mr. Schaefer: It is stipulated between the plaintiff and the defendants that the document marked Defendants' Ex-

hibit 23 for identification is a true copy of a letter written by Mr. George D. Scott, sales manager of the Pure-Pak division of the Ex-Cell-O Corporation, and sent to and received by Dr. Herman N. Bundesen, president of the Board of Health of the City of Chicago on or about August 2, 1938.

Is that correct?

Mr. Gariepy: Let me see it, please.

Yes, this is a letter that George Scott sent to Dr.

1704 Herman N. Bundesen on August 2, 1938.

Mr. Schaefer: I offer in evidence Defendants' Exhibit 23.

The Master: It may be received.

(Said document, being a letter dated August 2, 1938, to Dr. Herman N. Bundesen, from sales manager, Pure-Pak division, Ex-Cell-O Corporation, so offered and received in evidence, was marked DEFENDANTS' EXHIBIT 23, and is attached hereto and made a part hereof.)

Mr. Schaefer: That is all today, sir.

The Master: Do you rest now?

Mr. Schaefer: No. I would like to go ahead tomorrow.

The Master: Will you be able to start at 9:30?

Mr. Schaefer: Yes, I think so.

The Master: All right, 9:30.

Whereupon an adjournment was taken in the above entitled cause to 9:30 o'clock a. m. of the following day, Thursday, October 12, 1939.

1705 • • (Caption—) • •

Thursday, October 12, 1939,
9:30 o'clock a. m.

Met, pursuant to adjournment.

Present:

Mr. Gariepy, Mr. Rall, Mr. Schaefer, Mr. Horan.

1706 Mr. Schaefer: It is stipulated between the parties hereto, by their attorneys, that in making the bacterial counts reported in Plaintiff's Exhibit 59, Dr. Martin J. Prucha used a new nutrient agar, described in the seventh edition of Standard Methods for the Examination of Dairy Products, published by the American Public Health Associ-

ation in the summer of 1939. He used this same type of agar in performing the experiment recorded in Plaintiff's Exhibit 51. In general, the new nutrient agar gives higher counts than the old standard nutrient agar. It is known that at times this new nutrient agar gives twoce as large and even larger counts. If you take all of the counts reported in Plaintiff's Exhibit 59 and, roughly, divide them by two, you will have approximately what the old standard agar would have given.

Is that satisfactory?

Mr. Gariepy: That is o. k.

Mr. Schaefer: Will you take the stand, Doctor?

The Master: Dr. Arnold has been sworn, I believe.

Dr. Arnold: Yes, sir.

1707 LLOYD ARNOLD called as a witness on behalf of the defendants, having been heretofore duly sworn, resumed the stand and testified further as follows:

Direct Examination by Mr. Schaefer.

Q. State your name, please.

A. Lloyd Arnold.

Q. And where do you live?

A. 5844 Stony Island Avenue.

Q. What educational institutions did you attend, Doctor?

A. I received a Bachelor of Arts degree and a Master of Arts degree from the Texas Christian University at Fort Worth, Texas. The latter degree I received in 1908.

Q. Did you attend any other educational institutions?

A. In 1908 I went to Tulane University Medical School in New Orleans. I was there two years as a medical student. Then I went to the University of London and Oxford University.

Q. Those are both in England?

A. Those are both in England. I was there a year. Then I went to Germany for three years.

Q. What school did you attend there?

1708 A. I was in Hamburg, Germany at the Institute of Tropical Medicine, and I was in the University of Goettingen and the University of Munich and the University of Tuebingen.

Q. How long were you there?

A. I spent three years in Germany. I left Germany in 1914.

Q. Proceed.

A. I returned to this country, and I was at Vanderbilt University in Nashville, Tennessee, teaching and finishing up my medical course. I finshed there in 1919.

Q. What degree did you receive there?

A. The M. D. degree.

Q. Doctor of Medicine?

A. Yes, sir.

Mr. Gariepy: What year was that, 1919?

The Witness: Yes, sir.

Mr. Gariepy: M. D.?

The Witness: Yes, sir.

I then became superintendent of the Nashville City Hospital and pathologist at the Nashville City Hospital and instructor of internal medicine at Vanderbilt University.

Mr. Schaefer: Q. How long did you continue there?

A. I was there for one year. I then came to Chicago, as professor of bacteriology, pathology and public health
1709 at the Loyola Medical School, which position I held until 1925.

Q. What did you teach at Loyola University Medical School, Doctor?

A. I taught bacteriology, pathology and laboratory methods of clinical diagnosis. As head of the department at Loyola I was in charge of the laboratories of the affiliated Catholic Hospitals, including Mercy Hospital, St. Bernard's Hospital, St. Anne's, St. Elizabeth, and Misericordia.

Q. Did you also teach courses in public health?

A. Yes, sir, I taught courses in public health also.

Q. For how long did you remain in that position at Loyola University?

A. I remained in that position until 1925.

Q. Then what did you do?

A. During my summer vacations while I was at Loyola I attended Columbia University, the Lamar School of Public Health at Columbia, and worked in sanitary sciences under Professor Earl Phelps.

Q. How many summers was that, Doctor?

A. Three summers.

Q. Then what did you do?

A. Then I accepted a position at the University of Illinois as associate professor in bacteriology and public

1710 health. A year later I became full professor, in charge of the department of bacteriology and public health at the University of Illinois College of Medicine.

Mr. Gariepy: What year was that?

The Witness: 1926. In 1927 I became full professor.

Mr. Schaefer: Q. What position do you now hold?

A. I hold the same position.

Q. At the University of Illinois?

A. At the University of Illinois College of Medicine.

Q. What are your duties there?

A. My duties there are to teach bacteriology to medical and dental students and public health to medical students. I also have about thirty-five graduate students who are taking higher degrees in bacteriology and public health.

Q. Are you a member of any professional and scientific societies?

A. Yes, sir, I belong to about fifteen.

Q. Can you enumerate some of them?

A. The American Medical Association, Chicago Medical Society, The Institute of Medicine of Chicago, the American Society of Bacteriologists, the American Society of Immunologists, the American Public Health Association, the American Association of Food Technologists, and sev-

1711 eral others.

Q. Have you ever had any connection with the State Department of Public Health of the State of Illinois?

A. Yes, sir. From about 1927 to 1928 I was bacteriologist and consultant to the State Department of Public Health. I might say that my contract with the Board of Trustees of the University of Illinois is for 80 per cent of my time. Twenty per cent of my time is my own to do with as I please, as is customary for such professors in medical school.

Q. What has been the nature of your work with the State Department of Public Health, Doctor?

A. I had two duties with the State Department of Public Health. I organized and started a Chicago branch laboratory, serving the northern third of the state, in 1927. I was in charge of that laboratory. My other duties were as consultant to the director in problems arising of a public health nature in the state.

Q. Have you had any occasion to assist in the formulation of rules and regulations for that department?

A. For the last twelve years I have been a member of a committee appointed each year by the director of the State

Department of Public Health to formulate rules and regulations, which are, in fact, the sanitary code in regard
1712 to the control of communicable diseases in the State of Illinois.

Q. Have you had occasion to engage in any independent research in bacteriology, in addition to your work at the University that you have mentioned?

A. Yes, I have done considerable investigation work in the field of bacteriology.

Q. To what matters did that work pertain, Doctor?

A. It pertained to most all of the fields of bacteriology. The identification of bacteria, investigation of new diseases, whether bacteria or virus, the nature of new diseases that might occur, as well as problems in public health dealing with administration, vital statistics, and so forth.

Q. Are you a member of the Board of Health of the City of Chicago?

A. Yes, sir. I became a member of the Board of Health of the City of Chicago in the first part of December, 1938.

Q. In addition to serving as a member of the Board of Health of the City of Chicago, have you performed any other duties for the Board of Health?

A. Yes, sir. The Board asked me to assume responsibility for the dairy division of the Chicago Board of Health at the time leave of absence was granted to Mr.
1713 Krueger and Mr. Guerin, which was about the time I became a member of the Board.

Q. What has been the nature of the duties during that period of the leave of absence of those gentlemen, Doctor?

A. My duty was as the administrative and enforcement officer, in charge of the dairy division, which includes the milk shed, receiving stations, pasteurization plants and the distribution of milk in Chicago.

Q. That work began, you say, in December of 1938?

A. Yes, sir, early in December, 1938.

Q. Do you receive any compensation as a member of the Board of Health?

A. No, sir.

Q. Do you receive any compensation from the city of Chicago?

A. Yes, sir.

Q. For the work which you have done in connection with the dairy division?

A. Yes, sir.

Q. Of the Board of Health?

A. Yes, sir.

Q. And at what rate do you receive compensation?

A. Five hundred dollars a month.

The Master: Q. How does your work as a professor of bacteriology at the University of Illinois differ from that of Dr. Prucha?

A. Dr. Prucha is in the dairy division, Master. He
1714 deals with the bacteria associated with milk and milk products in the Department of Agriculture. My duties are in the College of Medicine and the College of Dentistry, dealing with disease producing bacteria, methods of diagnosis, methods of treatment and methods of prevention.

Q. I see.

Mr. Schaefer: Q. Will you enumerate some of the duties which you have performed, Doctor, as consultant to the Board of Health, in charge of the dairy division?

A. All violations reported by the division, by the inspectors, or determined by the inspectors in their routine work, were reported to me. I usually held conferences with the individuals whose permits were issued by the Board and who were in violation, to ascertain the reasons for it and to get compliance with our regulations.

Every afternoon, daily, I was engaged in such activities. I met with the inspectors rather frequently, in groups, to discuss their problems and instruct them in public health methods of the control of milk and milk products. Then new problems coming up in the health department concerning the dairy division were submitted to me for recommendations. There was quite a variety of those.

1715 Q. Have you done any work with respect to the ordinances of the city and the regulations of the Board of Health, with respect to milk and milk products?

A. Yes, sir.

Q. What has been the nature of that work?

A. In 1940, it will be necessary for the City of Chicago to revise their ordinance for mlik. Inasmuch as our time is up with the United States Public Health Service, we will have to revise it. I think every four years we have to bring it up to date, and I have given considerable time in the last few months to revisions of the new ordinance and various parts of the ordinance which will require revision and probably some fundamental changes in our ordinance structure.

The Master: Q. What do you mean, your time is up?

Is there any obligation in connection with the United States Public Health Service?

A. No, sir. The only obligation, Master, is that there is considerable protection to a municipality that operates under the United States Public Health Service ordinance and code. In case there is an epidemic or in case there is any difficulty, you have the United States Public Health Service model code to go on, and it puts you in a
1716 little stronger position than if you are independent of the federal code.

Q. What do you mean by stronger position? As to what?

A. A stronger position, that you are doing the right thing in the right way.

Q. In other words, you follow them as a good example, is that it?

A. Yes.

Q. There is no obligation to it?

A. No obligation at all. We sometimes exceed their recommendations, that is, we make them more stringent in some respects, and sometimes we do not make them as stringent.

Q. And why do you say there is a time limit of four years?

A. Because the United States Public Health Service regards the control of milk as an ever changing condition. As methods improve, as knowledge increases, they want to change the code to conform to the later information available, and they require, if you are going to operate under their code, to remodel it at certain definite periods, and I think it is every four years.

Q. Do they require or do they merely advise?

A. They merely advise. In other words, we could not have a United States Public Health Service rating in
1717 Chicago if we did not operate under the code.

Q. What difference does it make to you whether you have a United States Public Health Service rating or not?

A. The difference is really a competitive difference, Master. The cities like to show that they have a good sanitary milk supply.

Q. Just a matter of internal satisfaction?

A. Yes, sir. And if the United States Public Health Service says you are 98 per cent perfect in your milk supply, that is better than not having anything. That is just the sum and substance of it.

The Master: Go ahead, Mr. Schaefer.

Mr. Schaefer: Q. The matter of whether or not the milk ordinance of the city of Chicago will be revised in 1940 and what form that revision will take, if a revision is made, is a matter of determination by the city council of the city of Chicago, is it not, Doctor?

A. Yes, sir.

Q. Are you familiar with the operation of paper mills which manufacture paper board for use in milk containers, Doctor?

A. Yes, sir.

Q. What, in your opinion, are some of the impor-
1718 tant public health problems in connection with the sanitation of paper mills manufacturing paper for use in milk containers?

A. I should consider the problem of the raw material, the problem of the water supply and the physical equipment of the mill, the manual handling of the product and the storage and wrapping or the preservation of the final product, as the most important problems.

Q. You mentioned the raw material, Doctor. From the point of view of the protection of the public health, what if anything is the sanitary significance of the type of raw material used in paper mills manufacturing paper for use in milk containers?

A. I think the raw materials should be obtained from wood or logs which is virgin stock. The classification of that, whether it is spruce or pine, is immaterial from a public health standpoint, although spruce is used in paper containers because of the stability or rigidity of the fibres.

The logs should be seasoned, healthy logs, that is, healthy in that they should not have areas of injury on the surface, mould or a growth which causes a depression in the log, and this mould or depression is filled with what we call pitch. It is a resinous material secreted in the tree to
1719 prevent invasion by blight or mould from the outside. These pitch pockets contain large numbers of bacteria, many moulds and yeast, and the pitch pockets should be cleaned out by a machine that reams out the pitch pockets.

I think the logs should be stored, or the wood pile should not rest on the ground; it should rest on a cinder bed. If it rests on the ground, rain or melted snow wets the logs, dripping down to the bottom, and it gets the ground wet. The sun does not get to it. It stays moist, and sometimes the

logs at the bottom have whiskers of mould, and it is not proper, from a public health standpoint, to use such grossly contaminated logs.

If there is a cinder bed at the bottom, of about two feet in thickness, that will drain off the water. It is porous. It does not permit the mould and blight growth at the bottom of the log pile.

I think there should be a log washer. That is a mechanical device that scrubs and washes the logs.

Then they are dipped in a copper sulphate solution, which is for the purpose of destroying moulds and blight and yeast usually on the surface of logs stored in the open air and subject to moisture conditions.

1720 Q. You say that is done or it should be done?

A. It should be done. It is done in some places. It should be done everywhere.

When the matter of reused material is added to the raw products or substituted for the raw product, the problem there is—

The Master: Q. What do you mean by reused material?

A. I mean raw material that has been made into paper and then this paper put back into the system and disintegrated and used again, reused material.

We can classify reused material, ordinarily, in paper work, in three groups. One is broke, one is trim and one is chip.

Now, the broke, as the name indicates, is when the sheet breaks in its formation. When the mill keeps running, there is an accumulation of irregular pieces, different lengths and szies and irregularities, that are thrown back into the original stock again. That is called broke. If this broke is handled carefully, there is no objection to it from a public health standpoint, but if it is allowed to fall on the wet floor, the floor happens to be dirty, there is tracked-in mud or tobacco juice—that is, you cannot smoke in

1721 a paper mill and there is plenty of tobacco juice—then the broke becomes rather an unsanitary material. But if it is prevented from being contaminated with dirt, dust or moisture, it can be used again without any sanitary hazards.

The trim comes from the conversion departments. When the blanks are stamped out, there is always some reserve material. That again, if it is handled properly, baled immediately and protected and stored in a sanitary place, can be used without any public health hazard.

The chip is waste paper, collected from all sources and under all conditions, collected from alleys, streets, office buildings. Newspaper print and all sorts of material go into chip. That has no place at all in a mill that is making paper for milk storage and distribution.

Mr. Schaefer: Q. You mentioned the water supply, Doctor, as a matter of significance. From the point of view of the protection of the public health, what if anything is the sanitary significance of the type of water supply used in paper mills manufacturing paper for use in milk containers?

1722 A. I think the water supply is very significant, not only the fresh water coming in, but the recirculated water inside the mill. There is about ten times as much water in circulation in the mill as is brought into the mill at any particular hour or day.

Now, the fresh water that comes in seldom meets drinking water standards. It is usually water that is cheaper than the municipal water supply. Only those located where they can have mountain water or artesian water have really water that meets drinking water standards.

The water is usually filtered, that is, for commercial purposes, to prevent spotting of the paper, and it is chlorinated to destroy the bacteria.

Fresh water, clean water, requires only a small amount of chlorine. One or two parts per million will reduce the bacterial count to a satisfactory level in pure, clean water. But as soon as that water is put into the mill and is mixed up with the pulp, the pulp very rapidly takes the chlorine out. The chlorine combines with the organic material in the fibre.

It is necessary to recirculate water in the mill, because in the formation of the sheet of paper the water running off from the paper machine contains some fibres in

1723 suspension.

If this is dumped out in the sewer, the mill will lose several tons of pulp per day. In order to save that dissolved, suspended pulp, they reuse that water, which they term a closed system. Almost all mills use the closed system, to economize on the suspended pulp in the used water. This goes over and over again.

This closed system is a bacteriological culture medium. The water is usually warm, around 100 to 110 degrees Fahrenheit. With the pulp in suspension and soil bacteria that usually get in through the water or through the pulp,

we have a bacterial culture and the build-up of culture in the closed system, built up to several hundred thousand or even million bacteria per cc of the closed system. If one considers that there is sometimes twenty to fifty thousand gallons of water in the closed system, the bacterial population in it would be a tremendous number.

That could be prevented by the use of continuous chlorination of the closed system. Ordinarily we use ammonia along with chlorine, which prevents the chlorine from being dissipated or being used by the pulp too rapidly. It
1724 stabilizes the chlorine. It is what is known as chloramine, which is a mixture of chlorine and ammonia.

With a continuous supply of chloramine fed into the circulating system, one can reduce the bacteria to a low level, that is, within sanitary and public health safety factors.

Ordinarily, the amount of fresh water brought in equals the amount of overflow water. They try to keep their closed system full, and as the water flows out fresh water comes in, and the amount will vary tremendously from hour to hour, depending upon the overflow system.

Q. Will you describe the overflow system, Doctor?

A. The overflow system is in two parts. Part of the fresh water coming in is used for washing and cleaning purposes and is used for cooling purposes. That is all overflow. Then there is a certain amount of overflow from the closed system, which they are trying to minimize, because that contains valuable stock, and it will go out in the sewer instead of into the paper sheet.

Q. I think you mentioned the physical equipment of the mill as a matter of sanitary significance. From the
1725 point of view of the protection of the public health, what significance, if any, do you attach to the physical equipment of a mill manufacturing paper for use in milk containers?

A. I think the physical equipment is an important factor from a public health standpoint. The physical equipment will vary with the type of pulp used, that is, whether it is mechanical pulp or chemical pulp, or whether it is a mixture of both. It also varies as to whether the mill makes its own pulp or buys the pulp already prepared. There are all variations between those in the various mills.

In principle, it consists of a series of vats or tanks in which the pulp in solution or in suspension in water is stored.

The principle of paper making is to disintegrate the wood into small individual fibres, suspend these fibres in the water, and then by means of a woolen belt, which they call felt, a felt belt which is made of Australian lambs wool, long fibres—probably the best wool on the market—these long fibres sticking out from the big flannel belt, goes through a pan containing fibres in suspension in water. There is about five per cent pulp and 95 per cent water.

1726 As this flannel belt goes through there, it picks up fibres on these rough pieces of wool that stick out, and that is the way the sheet is formed. It goes from the felt on to the dryers.

Now, referring to the vats, the whole system of the vats is to use the mixing of the water with the fibres, increasing the dilution each time through a beater system, or pulpers, and various mechanical means, in order to get a uniform distribution of fibres in a low dilution of water.

Most of those vats are cement vats, made of cement. Cement vats are objectionable, because the inner surface is rough, and as a vat full of pulp is emptied the pulp tends to stick along the sides of the vat, because it is rough, and holds it. The vat will remain empty for a couple of days, and is filled up again, and there is a coating of dry pulp on the inside. That is many times repeated, until there is a build-up of several inches of pulp on the inside of the vat. This pulp grows bacteria, slime, and becomes quite a source of annoyance to the paper mill, and it is important from a public health standpoint, in that it feeds into

1727 the closed water system a high content of bacteria. It acts as a reservoir for bacteria.

If these cement vats are lined with glazed tile, it makes a much more sanitary part of the physical equipment, in that the pulp, or, as the paper men say, stock, does not build up on the sides of the vat and does not act as a reservoir for bacteria feeding into the system.

The pipes should be of copper. Iron pipes act like the cement. The insides of an iron pipe will cause a few fibres to adhere, and they will build up and build up, and the joints and angles and elbows of the pipe build up bacteria very fast.

The bacteria and mould and things that go in the so-called slime that is building up on the inside of the pipe act on the iron, and that build-up is sometimes as black as a piece of coal, containing numerous bacteria; and that is the typical slime spot in the finished paper. It is usually a

mixture of iron pigments from the iron pipes, with the slime that is built up on the inside of the pipes.

There are so many variations in the physical equipment, the screens and the various pulping machines,
1728 that they hardly need any comment.

The next piece of equipment of importance is the paper machine itself. A paper machine is divided into two parts, what we term the wet end and the dry end.

The wet end of the paper machine is that part of the machine where these felts are picking up fibres from the dilute fibres in water. The number of felts in circulation will depend upon the thickness of the sheet that is being formed on the machine at that time. The felts pick up the fibres with the water and then squeeze it out, as they go through the rollers. So the felts can build up a great number of bacteria in the felts.

At periods of close-down, the wet end of the machine should be filled with a chlorine solution and the felts run through it or cleaned, to disinfect them.

From the felts the sheet passes on to the dryers. There is a space between the felt system or wet system of the machine and the dry system. This space is bridged over by a sheet that we term a wet web. Now, the wet web is the sheet that is strong enough or at least has enough fibres in
it, with part of the water out, to stand by itself and to
1729 be a sheet.

Then it passes over to the dryers. There is usually about 70 per cent water and 30 per cent fibres in the wet web. Then it goes to the dryer system.

Now, the real characteristic of the mill is its dryer system. Everything else is about constant.

Now, the dryer system has been referred to in previous testimony as hot cylinders.

The Master: Q. Hot what?

A. Hot cylinders. They are really dryers in the paper manufacturing language. These are heated by steam and are pressed against each other with a certain pressure.

The purpose of the dryer system is dehydration. When the finished paper comes out, it is about five per cent wet and 95 per cent fibres. When it starts in at the beginning of the dryer system, it is 30 per cent fibre and 70 per cent water. The dryer system is for the purpose of reducing the water to about five per cent.

If there is a larger dryer system, say 80 to 100 dryers,

which is a large dryer system, the sheet will go through very fast, and the production will increase. If there are
1730 half that many dryers, the sheet will go through just half as fast, as the purpose of the dryers is to reduce the aqueous content of the wet web to about five per cent moisture.

The dryers usually have an artificial ventilation above them, so as to prevent the accumulation of moisture on the ceiling. On the top of the dryer system, where we have hot air and water evaporated, it would add right back to the dryer again, and soil the sheets or spot the sheets. So they usually have artificial ventilation or a blower system over the dryers. That blows the air from the outside on to the top of the dryers and that is pulled off by negative pressure, to keep a rapid circulation of air over the dryers, to prevent condensation of water.

This blower system and artificial system of ventilation should be filtered air. If it is not filtered, then the amount of bacteria deposited on the sheet in its formation will vary according to atmospheric conditions. If it is a dry, windy day, there would be a great number of bacteria in the air. If it is a quiet day, with no wind, and after a rain, there will be very few bacteria in the air. So the surface contamination of the sheet will vary with atmospheric conditions, unless there is filtered air used in the artificial ventila-
1731 tion of the dryer system.

Then from the dryers they pass on to what they call a calender. On the calender stacks water is sprinkled on the sheet and pressed through a cold steel process—they are in cylinder form—for the purpose of putting a gloss on the surface of the sheet, and it also renders the surface of the sheet partly water resistant. It is just a very thin, hard, shiny layer over the sheet of paper. There is no heat used in the calender stacks, and the water in the calender stacks should be sterile, because any bacteria added or in the water in the calenders will be added to the finished product.

From the calenders it passes over the rollers, and it is either rolled in rolls or is cut in squares.

The entire system is considered a closed system, because of the closed water supply and the reuse of the water and the reuse of the pulp.

In a mill running paperboard for milk containers, that makes other paperboard, oftentimes of less sanitary quality, there may be a mixture of the two pulps.

If, for instance, they are making a side-
1732 wall board for boxes or for some purpose for which there is little need of sanitary control, they usually use chip board in those cheaper or what I might say carton-like products.

If we get the system filled with chip board, which has a very high bacterial count, and then we start running virgin pulp through it, it takes several hours to work out all of the chip board and produce a sanitary sheet, although the sheet may meet all specifications as to color and thickness and consistency, but it will have a very high baeterial count, until the chip is worked out of the system.

Q. You mentioned as a matter of public health significance, Doctor, the matter of manual contact in the paper mill. What is the sanitary significance of manual contact with paper in paper mills manufacturing paper for use in milk containers?

A. That is of relative importance. It is a minor problem, because the amount of manual handling in the mill is very small compared to the manual handling later on in the conversion period.

There are usually about three, not more than four men
on the dry end of the paper machine. It is usually a
1733 mechanical process, and it is only when difficulty arises, like a break, where there is manual handling, or when the paper is being rolled there is sometimes manual handling if the roller stops.

The amount of manual handling will vary on the finished product, as to whether it is in squares or in cylinders or rolls. The squares, of course, are exposed more, because they have to be cut and stacked. That is done to a great extent mechanically, but there are still the edges and tops that are sometimes touched, and there is a greater hazard where there is a second operation than where the primary operation of rolling or in rolls is the only one carried out.

Q. You mentioned the matter of storage of the paper as a matter of public health significance, Doctor. From the point of view of the protection of the public health, what is the sanitary significance of the storage and packaging of paper in a paper mill?

A. If the paper comes out in rolls, there is little advantage in wrapping it, because the outside of the roll is usually soiled in rolling it to the storage or trucking it, and in the conversion the outer two laps are thrown away,

because they are dirty. They form a seal. The edges
1734 are usually touched by hand, but the stamping operation usually eliminates the edges anyway.

Some of the mills wrap the rolls. It depends upon the distance of conversion. If they have to be shipped by train or truck, they should be wrapped. If the conversion unit and the mill are in the same building, the rolls do not have to be wrapped. They can be trucked over to the conversion unit.

In the wrapping they should be wrapped securely and kept dry. In the wrapping the quality of the wrapping paper should be such as not to contaminate the clean sheet. I mean by that, if we have a wrapping paper made of chip board, that would be unsatisfactory, but if the board has a liner, or what we call kraft—kraft is southern pine, a very economical article—if it is lined, it will prevent the bacteria in the chip from coming in contact with the finished paper in the storage and handling, which would be satisfactory from a public health standpoint.

Q. Is the manner of handling paper board for use in paper milk containers, while that board is being transported from the paper mill to the plant where it is converted, of any significance from a public health point
1735 of view?

A. Yes, I think it is.

Q. Why is that a matter of public health significance, Doctor?

A. Because in transit it depends upon the cleanliness of the truck, the box car, the flat car or whatever it is they are transported in. It depends upon how securely it is wrapped. If it becomes unwrapped or torn, then the sheet is exposed to damp conditions, rain, snow, and also exposed to handling by the employees, or even walked on, getting dirt from the shoes, and various other things, unless it is wrapped securely. It should certainly be protected from moisture, because moisture, plus dirt, will support bacterial growth on the surface of the paper.

If it becomes unwrapped, then it becomes a public health hazard in the massive exposure to contamination, not only from dust and air, but also from human contact during transportation and handling.

Q. From the point of view of the protection of the public health, Doctor, what are some of the important problems in connection with the cutting, scoring and printing of paper for use in milk containers?

A. Cutting, scoring and printing is a part of the conversion of the paper. It is a part of the process of
1736 converting the continuous sheet into a finished product.

The important factors there, from a public health standpoint, are the storage conditions in the converting plant of the finished material received from the mill.

Again, there, it should be stored in a clean, dry, light space, free of cockroaches and rats and mice and vermin of all kinds. It should be wrapped to protect it from contamination.

It is quite true that the edges of the sheet, if it is in a flat sheet, or the edges or ends of the rolls, do not go into the finished product, but nevertheless, the workman or the man putting the rolls on the machine touches the ends and then he touches the finished product; he adjusts the sheet, and he conveys from the exposed edges the bacteria accumulated on to the sheet that goes into the finished product, and the exposed edges, although they may not of themselves be part of the finished product, should be protected from contamination for that reason.

Q. Is there any sanitary problem in connection with the printing of paper containers for milk?

A. Yes. The printing is usually a second operation. The first operation is the blanking or the cutting out.
1737 That is usually done automatically by a machine.

There is a minimum health hazard as long as the machine operates 100 per cent efficient, but when it jams or stops, then the operator has to pull out the container, and he is very careful to inspect the first few that come through after he starts over again, and he inspects the last that went through, to see that they are in good shape. The health hazards there are associated with the mechanical imperfection of the blanking machine.

If the paper container to be manufactured is square, there is what is called a scoring operation. If it is a circular container, it is not the scored. The scoring operation is an operation whereby a depression is made in the sheet, so that it will bend easily over that depressed area.

Again, the scoring operations have the same health hazards that the blanking operations have, which are only associated with the imperfection of the machine, the number of times that it has to start and stop again.

Now, the printing operation is associated with more health hazards, because as the blank is printed and stacked, if there are very many blanks stacked on
1738 on top of each other the pressure is so great that offsets will occur, that is, the top of one blank will print on the bottom of the blank above, so to prevent offsetting they never stack the blanks very high when they come off the printing machine. Twenty or thirty blanks are plenty. Sometimes not that many.

So that as a result they are very frequently picking the blanks up and handling them, and there is more handling in the printing operation than in either the blanking or the scoring operation.

These blanks then are usually kept about 24 hours. Before they are wrapped or before the conversion is finished, if it is all finished in one plant, they should be protected from dust and dirt and they should be covered. The covering also protects them from human contact, so no one lays hands on them, dirty hands, or does any sneezing or coughing around them at all.

Q. Is the type of ink used a matter of public health significance, Doctor?

A. Yes, sir, I think it is. I think the ink used should be as free of toxic material as possible.

The Master: Q. Free of what?

1739 A. Of toxic material, poisonous material, as is possible.

Q. Yes.

A. Most of the inks do contain some heavy metals as part of the dryer in the ink or part of the vehicle of the ink. The matter of offsetting, that is where the printed top of a blank comes in contact with the unprinted bottom or inside, presents some public health problems, and if this occurs with regularity or very frequently you really have on the inside of the blank, next to the milk, a material that is toxic. It is in small dilution, a very small amount, but a very small amount of heavy metal ingested over a long period of time is certainly a health hazard, and particularly a health hazard for the infant and the young child.

Mr. Schaefer: Q. Are there any health hazards associated with the forming of paper milk containers?

A. The forming of paper milk containers is divided into two phases. There is one group of containers where the entire conversion takes place in one plant. They leave

that plant as finished containers, ready to be filled in the dairy.

The other group, after the printing operation, after
1740 they are blanked, scored and printed, those flat blanks are shipped to the dairy and the conversion is finished in the dairy.

I think the same general principle of prevention of human contact and the avoidance of any contamination from air, dust, moisture, should hold for both of the forming processes, whether they are in the same plant or in another plant.

Q. Is the type of adhesive used or applied in forming the container a matter of public health significance?

A. Yes, sir, I think it is. We can divide our adhesives used into three groups.

One is the so-called protein adhesive. That consists of animal glue and casein. Animal glue is a by-product of the packing house industry and should never be used on a food container. Animal glue is a by-product of what we call tankage. Tankage in the packing house industry is condemned carcasses, not fit for human consumption, that the federal inspectors of the United States Department of Agriculture condemn, and they go into a tank and are boiled out. This animal glue is a by-product of the tankage material. It is usually highly contaminated and may contain even lock-jaw bacillus germs and any other germs.

1741 The other type of protein glue is casein, which is a by-product of the skimmed milk industry. The lactose, milk sugar, and casein and milk protein, are recovered from skimmed milk for commercial purposes. Casein usually contains many bacteria. It is a good culture medium and contains several thousand bacteria per gram or even several hundred thousand per gram, of the dried material. Casein is used in milk containers. Some milk containers have casein glue on them.

Now, the other type of glue are the starchy glues, which are of corn starch, tapioca and various types of starchy materials. These glues will support bacterial growth. They are not as grossly contaminated as is casein glue, and there is very frequently an antiseptic of some kind added to the starchy glues to prevent bacterial growth.

The Master: Q. How many kinds of glue have you now? You have the animal glue, the casein glue and what other?

A. The starchy glues.

Q. Yes.

A. The other class of glues are the resin glues, or what is termed in the industry high melting point glues. They are really thermo-plastic substances. They are artificial resin material, which when heated to 250 or 300 de-
1742 grees Fahrenheit, is liquid. On cooling they become solid, and they form a gluey mass, with an adhesive surface, and are very effective adhesives, and are perfectly safe, as the temperature to which they are applied sterilizes them.

Those are the three types of glues,—protein glues, starchy glues, and the resin glues.

Mr. Schaefer: Q. Do the resin glues look like the material that you find on the top of a bottle of Scotch?

A. No, I don't think they do. They are much thinner. They are colorless. Looking at a container you cannot tell any difference between the resin glues and any other group, after you open the seam.

Q. Is the matter of the physical condition of the employees in a conversion plant a matter of public health significance, Doctor?

A. Yes, I think it is.

Q. Why?

A. It is much more significant, the matter of the health of the employees and the health habits of the employees in the conversion plant, than it is in the paper mill, because in a paper mill there are only about three or four
1743 employees on the dry end of the machine. They make tons of paper a day. In the conversion plant there are several hundred employees in proportion to each one in the paper mill that comes in contact with the product. Their state of health and their habits of cleanliness is a very important factor in preventing contamination of the product.

In the conversion, our health problems there are to prevent the contamination of the product with human bacteria, that is, with bacteria from the nose and throat, bacteria from the feces and the urine, which from a health standpoint are very dangerous bacteria, because accompanying those bacteria are the bacteria that produce disease in man, and the contamination during conversion or at the last steps of the conversion process with human bacteria has real major public health significance.

Q. Is the matter of hygenic facilities and practices in the conversion plant a matter of public health significance?

A. Yes, sir. You cannot expect employees to keep their hands clean unless you provide convenient facilities for doing so.

An employee working on a piece basis, getting paid by so many pieces of work an hour, so many containers
1744 an hour, to expect him to spend ten or fifteen minutes going to some distant place to wash his hands,—why, he just does not do it.

The washing facilities should be at hand and very close at hand, and the employees should be relieved at least every two hours, probably every hour, to allow him or her to clean their hands and wash them and keep them from becoming contaminated, and thereby contaminating the product. A clean hand is a safe hand. A dirty hand is a dangerous hand.

Q. From a public health point of view, Doctor, what matters are of significance with respect to the paraffining of paper milk containers?

A. I think the type of paraffin used, that is, the quality used, is an important factor.

The process in the industry is called waxing. It is a waxing process. In the manufacture of food containers in general they use waxes of various kinds. They do not always use USP paraffin. They use lower grades in their waxing procedures. For milk containers I think it should be a USP paraffin, which is pure paraffin, and the paraffin should not be oxidized to acid products or other unknown materials which vary in concentration, according to time of heating or amount of oxidation.

1745 Q. Is the shape of the container a matter of significance with respect to the effectiveness of the application of paraffin?

A. Yes, I think it is. No matter whether the container is round or square, there is always a seam in it, where the edges are lapped over, forming the package. That is a side seam.

This side seam has two thicknesses of cardboard, overlapping, with a glue between the two, giving a relatively thick area, as compared to the remaining part of the container.

As this container is dipped into hot paraffin, inverted

and allowed to drain out, the double-lapped board retains the heat longer than does the rest of the container, because of its thickness; it holds the heat longer. In holding the heat longer, the paraffin remains liquid longer over the seam, which tends to decrease the amount of paraffin that solidifies over the thickened seam.

The second factor and one which I think is of equal significance is that there are two open ends at the seam, that is, the ends of the board.

Now, in the calendering operation, in the glossing operation, the surface is hardened and smoothed by a
1746 tremendous pressure in these dry, cold cylinders. That gives a gloss and a hardened area to which paraffin sticks very well, but at the ends of the container are fibres that are open and the whole mass of the paper board is open, it is not calendered at all, so as long as the paraffin is liquid it goes into the board at the ends, and we have two ends which are pulling on the liquid paraffin by capillary attraction into the board, so we have both factors that tend to limit the thickness of the paraffin layer over the seam area.

Another matter of public health significance is the glue that is on just that area where we have the thinnest coating of paraffin or the most imperfect coverage of paraffin almost anywhere in the container.

Then the other areas are the corners of container, if it is a square container. In the scoring operation there is simply a depression or a trough pressed into the board, so it will bend easily at that point. In the scoring or the bending of the paper the cellulose fibres or strands that cross over this area are fractured or broken during the bending of the paper at right angles. If you look at that with a magnifying glass, either the outside or the
1747 inside of the angle, you find fine fibres sticking up, like hairs on the head, just little fibres sticking up, and the reason for the imperfect paraffining at those corners is the fact that these open fibres fill up with paraffin, like the open ends at the seam, and the liquid paraffin, as long as it is liquid, tends by capillary attraction to go into these broken ends of the fibres. So it really comes down to the point that the surfaces that are imperfectly paraffined are usually the surfaces that are not covered by the calendering operation.

Sometimes there are areas on the bottom of the con-

tainer that are not properly covered with paraffin. Those are usually caused by some imperfect die, used in forming the container. If the die is roughened on the bottom and the container is formed around it and is pressed against the bottom, that roughened die will fracture or break the calendered surface, and again we have exposed fibres that have not been smoothed down in the calendering operation. The paraffin there will be thin, and sometimes, if there is considerable injury to the fibres, all of the paraffin will be absorbed into the board.

Q. Is the bactericidal action of the application
1748 of paraffin to paper board affected by the moisture content of the paper board?

A. Yes, sir, it is.

Q. Why is that so, Doctor?

A. Paraffin is an oil, and paraffin without any water in it at all is a very weak germicidal agent, in the general sense of the word. It acts the same as dry heat. Dry paraffin has the same bactericidal power as dry heat.

Q. By dry paraffin, Doctor, do you mean dry hardened paraffin?

A. No, I mean paraffin without any water in it at all, dehydrated, dry paraffin, without any water.

Q. Heated, melted?

A. Yes. The moisture in the board is heated along with the board when it is submerged in hot paraffin. The hot paraffin penetrates very rapidly the surfaces of the board, and as the interior of the board is heated, with this hot paraffin, with the surfaces sealed, and there is moisture present, then we get a similar effect as the flash pasteurization of milk, which is the pasteurization of milk at high temperature for a few seconds. The moisture is imprisoned in the board and is heated by the hot paraffin,
and then we have an aqueous system or water system
1749 of sterilization inside the board, and the greater the amount of water the more rapid will be the bacterial killing time. The less amount of water, the slower will be the bacterial killing time, all other conditions being equal.

Q. Have you performed experiments, Doctor, designed to determine whether or not paper containers for milk are absorbent?

The Master: That is, paraffined containers?

Mr. Schaefer: Paraffined paper containers, yes, sir.

The Witness: A. Yes, sir, I have.

Mr. Schaefer: Q. What type of experiments did you perform, Doctor?

A. I performed one experiment, you might say, in two sections. One was to add a dye to the milk.

Mr. Gariepy: When was this?

Mr. Schaefer: Q. When did you perform these experiments?

A. Those experiments began in about May, 1938, April or May, 1938.

Q. Go ahead with your description of the experiments.

A. A dye was added to the milk in the container. That is, the container was full of milk. It was opened and a dye added. We usually use a red dye.

1750 The container was closed and returned to the ice box for 24 hours. Then it was opened and emptied and rinsed out, free of milk or adhering milk or dye. Then it was opened up and examined. The areas where the milk penetrated carried the red dye with them.

The other experiment was to obtain paper containers filled with milk, empty the milk out immediately, rinse the paper container well with water, to free it of all milk or adhering substances, and then fill it with a weak solution of methylene-blue, or any other common dye. I have used half a dozen different dyes. They all act about the same.

Then leave that in there for one hour or two hours, empty it, again rinse the container free of any adherent material, and open it up and examine it.

In some instances, as in the first test, using the red milk, we rinsed out the container, and then it was filled with methylene-blue, and let set for a couple of hours, and then examined.

In all three of these tests, the distribution of the stain or the dye in the container is approximately the same.

1751 Q. Were all of the containers which you examined absorbent?

A. Yes, sir, all of them.

The Master: This may be a good stopping place for a recess. Suppose we have a five minute recess.

Mr. Schaefer: Very well.

(A short recess was here had, after which the proceedings were resumed as follows:)

The Master: Proceed, Mr. Schaefer.

Mr. Gariepy: If the Master please, there appear to be some very interested spectators in this matter. Mr. Greer, are you one of them here?

Mr. Greer: I am a spectator, and very much interested.

Mr. Gariepy: Are you with the Glass Bottle Institute?

Mr. Greer: I am counsel for the Independent Milk Dealers Association.

The Master: What has that got to do with this, who sits here?

Mr. Gariepy: I want to show who is present. You wanted to know about Dr. Tonney.

The Master: I don't want to know anything.

Mr. Gariepy: Very well.

The Master: I don't think it is any concern of the
1752 court who is sitting here. The only thing about Dr. Tonney is this: The reference was made to him because he seemed to be actively engaged in helping you.

Mr. Gariepy: And Mr. Greer has been talking to Mr. Schaefer during the recess, so he seems to be interested also in the glass bottle proposition.

The Master: I don't think that has anything to do with it. It is not important to me who sits here.

Mr. Greer: I might say to the Master that I am a member of the Bar of Massachusetts and I am interested in similar matters. I asked Mr. Schaefer about what has been going on and he has very kindly given me some information.

The Master: Let us go ahead with this lawsuit here.

Mr. Schaefer: Q. From the point of view of the protection of the public health, Doctor, do you attach any significance to the fact that paper containers for milk are absorbent?

A. Yes.

Q. Why?

A. Well, non-absorbency or impermeable surfaces are required of all milk containers.

Mr. Gariepy: I didn't get the names of those surfaces, impervious or not?

1753 A. Impervious or impermeable surfaces are required of all milk containers from the time the milk leaves the cow until it gets to the consumer. Smooth, impervious, non-absorbent surfaces are required of the milk pail or the milking machine, if that is used, the can that conveys the milk from the farm to the receiving

station, all of the receiving station equipment, the tanks, tank trucks and all of the pasteurization equipment, as well as the final container in which the material is distributed to the consumer.

I think if it is absorbent, then we introduce so many factors as to what it is absorbing, how much it is absorbing, that it becomes quite a major public health problem.

Mr. Schaefer: Q. What effect has absorption with respect to the transmission of material in the paper to the milk?

A. I think it has quite an important effect. When a container is absorbent, as a paraffined paper container, the milk—

The Master: Pardon me. Let us have a recess for a couple of minutes.

(A brief intermission here ensued.)

1754 The Master: Continue.

Mr. Schaefer: Q. Complete your answer, Doctor.

A. The milk will penetrate through the paraffin or, in unparaffined areas, into the paper board. This forms a liquid bridge in which materials can pass in both directions, depending upon pressure, position of container, and so forth.

Then the type of bacteria present in the paper board and on the surface of the paper board becomes a major public health problem with a porous container.

These bacteria can be roughly divided into two groups. One are the soil bacteria, and one are the bacteria derived from human source.

Now, the soil bacteria are bacteria in the ground. Those bacteria have been in the ground multiplying and growing for millions of years. They are necessary for the life of man. When anything is deposited on the soil, like a leaf or a corn stalk or a dead bird or a dead man, these bacteria in the soil decompose. That material is converted into simple mineral substances, which are in turn taken up by the roots of plants, pass up the stalk of the plant or tree, and are synthesized or built up into food products

that man uses or animals that feed on plants, and
1755 man feeds on them.

So the soil bacteria are very necessary for our existence. Those bacteria are characterized by their ability to decompose starches and proteins. They are very active in a chemical sense. When those bacteria get into paper board and get into the milk from the board, they

do what they have been doing for several thousands of years, what their ancestors have been doing,—they start decomposing the milk. That is their function. Both the casein part or the protein is decomposed in the milk container, just like it is decomposed if you pour it on the ground where those bacteria are.

Also the sugars are decomposed.

The Master: Q. The sugars in the milk?

A. The sugars in the milk are decomposed if they come in contact with these bacteria. That is their function in nature, that is, to reduce complex substances to simple substances.

In the process of decomposition, particularly with casein or protein, there can be toxic products formed. That is the amins. Amins are split down protein material that are toxic for men. They cause irritation. They carry diarrhea, increased peristalsis of the intestinal tract. Those that break down or decompose the sugar form acids.

1756 Those bacteria are not disease producing, but they are harmful in that they decompose milk.

Then a second problem from a public health standpoint is that when we find a food or a food product or a food container that is high in bacterial content, assuming that they are harmless soil bacteria, we interpret that as unsanitary practice. In some way the soil is transported into the food. Then it is just one step to transport sewage into the food, or transport urine into the food, or saliva. So a high bacterial count, admitting that they are harmless bacteria, has considerable public health significance. It indicates unsanitary practices.

Now, as to the human type of bacteria, they are the most harmful ones.

Most of the activities of the Health Department are concerned with preventing the transfer of contagion from one person to another. The vast majority of our diseases are human diseases, transferred from human to human. So when we detect on a food container human types of bacteria, we immediately suspect that pathogenic or types that cause diseases may be associated with those human types.

1757 In the nose and throat of man we always have bacteria. Not all of them are disease producers, but we may have chronic carriers of diptheria, scarlet fever and other diseases, which can be conveyed by saliva or by con-

tamination of hands with saliva to a food or a food container.

When we find human bacteria, we are convinced there is a break in what we term sanitary technique, and it becomes a major public health problem.

Then continuing with the question as to the degree of absorbency of the container, that is an important factor, but the mere fact it is absorbent indicates a public health hazard. Whether it is absorbent on the bottom, through a rough die, or at the scoring line, due to breaking of the fibres, or at a seam, due to the double thickness in the free ends, whether one or all places are absorbent, the mere fact it is absorbent is of considerable public health concern.

The matter of offsetting is also of public health concern. As I mentioned before, it is quite true that one or two containers, with the ink on the inside of the offset, if the paraffin chips at that place and conveys the ink in the paraffin to the individual, that would not be very significant,
1758 but if that occurred frequently, daily or several times a day, it would be a major public health problem.

The Master: Q. What would be?

A. The presence—

Q. Of offsetting?

A. (Continuing.) —of the offsetting getting into the milk, containing heavy metals. If you look with a magnifying glass at the printing material on a container, it is in a ridge. It is an insoluble substance pressed down on the container, with a rapid oxidizing or drying agent that dries quickly. The offset is just the same thing. It is just a little ridge of insoluble dye containing heavy metal, and that chips off with the paraffin into the milk.

Q. Is there any bacteria in the ink?

A. Yes. It is a chemical poisoning and not a bacterial poisoning.

Q. You think one is just as bad as the other?

A. Yes, sir.

Mr. Schaefer: Q. Has the presence of offsets any effect on the efficiency of the application of paraffin, Doctor?

A. I doubt whether it plays much of a role in that. I am not sure, but I don't think so, sir.

Q. Have you an opinion, Doctor, as to the accuracy
1759 of the test described in this testimony as the rinse test as a means of determining the bacteriological condition of paper milk containers?

A. Yes, sir.

Q. What is that opinion?

A. I don't think the rinse test, as applied to a porous container, compares to the information you can get from a rinse test made upon a non-porous or impermeable container.

With the porous container, it depends upon the porosity, the degree of porosity. Then the rinse test does not give you the right picture, because the danger of the paper container for milk is that that milk is stored in the container. If it were used for a drinking cup, it would be a different problem, but we have milk storage here.

The Master: Q. You have what?

A. Milk storage, for a duration of hours, the milk is stored in the container.

Q. Yes.

A. For that reason the rinse test does not give you the degree of permeability of the container after storing milk for one, two, three, or four days, as might happen the home, in the ice box.

1760 Mr. Schaefer: Q. In actual operation?

A. Yes, sir.

Q. Have you an opinion, Doctor, as to the accuracy of the test that has been here referred to as the disintegration test, as a means of determining the bacteriological condition of paper milk containers?

A. Yes, sir. I have worked for about eight or ten years on various problems associated with the way cellulose fibres react to bacteria.

Now, a wood fibre is a cellulose tube. It is just a tube forming a wall with cellulose, and that is impregnated for stability purposes with what we call lignin. Lignin is a sort of resin product manufactured or formed by the tree that impregnates these cellulose tubes that make up the tree substance. These tubes are for the purpose of conveying the liquid from the root up to the leaves. The action of sunlight and temperature on the leaves produces a slightly negative pressure or slight suction, and that is sufficient, with the capillary attraction in these long slender tubes—there are billions of them running up the length of the tree—these tubes, by capillary attraction, bring water and sap up from the roots.

When we purify those cellulose tubes, we remove all of the lignin, or as much as we can, and just have the tube.

1761 That is what our pulp does. It is just purified cellulose tubes or fibres.

These are hollow tubes, and they have a tremendous attraction for bacteria.

I think it is the difference in the electrical charges between purified cellulose and bacteria that causes the attraction of bacteria on to the fibre, but with cellulose fibres, when bacteria touch them, they will stick, and they will stick a long time. Even by putting them in a mechanical shaking machine it is hard to release them from the fibres.

In my opinion, what happens with our disintegration test is that we are counting the number of colonies that develop from a disintegrated sample of paper. That part of the test is accurate, but the part that I think is in error is that we consider each one of those colonies to be one of the bacteria. I think that is wrong. Our whole system of sanitary water and milk analysis is based on that assumption. It is probably true here, because we have bacteria suspended in a liquid, like in urine or in water or in milk, but when we have cellulose fibres in there, then we have a hundred bacteria or a thousand collect on that fibre. When that fibre is put into growth promoting media, we have one colony. That one colony does not represent one bac-
1762 teria. It may represent an X number of bacteria, which is impossible to know.

So I doubt very much, in fact I am convinced that our disintegration test, interpreted in the same way as water counts, as milk counts, is wrong. I think we have many more bacteria in our sample than we are counting, assuming that only one bacteria forms a colony. There are many more bacteria in each colony.

What substantiates that past experience with cellulose fibre is that if you look under the low power of a microscope at an agar culture in a Petri dish, you will find that the vast majority of the colonies that develop are developed in relation to a fibre. The original inoculum was on the cellulose fibre. I think from my past experience with the cellulose and observing the disintegration counts, I don't believe they give you a true picture of the number of bacteria present.

Q. In your opinion, Doctor, is the fact that paraffin from paper containers gets into the milk put into those containers a matter of any public health significance?

A. Yes, I think it is.

Q. Why, Doctor?

A. I don't think it would be significant for an adult
1763 or a healthy growing child, but I do think it would be significant for a baby or a child suffering from diarrhea or a senile, older person suffering from diarrhea, or premature babies, even though they are healthy, because while paraffin is not irritating, it is just a foreign body, it is a foreign globular mass that is in the intestinal tract, and if the intestinal tract is reddened, inflammed, irritated, it is just an added irritation, in a mechanical sense.

Q. Is milk an essential part of the diet of infants, Doctor?

A. Yes, it is essential and necessary.

Q. Is it an essential part of the diet of injured persons and convalescents, normally?

A. Yes.

Q. Is it an important part of the diet of children?

A. Yes, it is.

Q. Have you an opinion as to the proportion of the total milk consumed in the city of Chicago which is consumed by children under the age of twelve?

A. Does that question refer to fresh fluid milk only?

Q. Yes, sir, fresh fluid milk only.

A. I would say more than half, considerably more
1764 than half. I would hesitate to give the exact percentage.

The Master: Q. May I ask a question there? With reference to the irritating effect of a bit of paraffin in the intestinal tract, all solid food causes irritation to the intestinal tract, doesn't it?

A. I don't think so. It is according to what you mean by solid food, Master.

Q. Let us put it as anything that leaves a residuum to be passed off through the intestines.

A. No. You take milk, for instance. The coagulum of milk is so broken up that it is just a gelatinous mass, just a weak mush in the intestinal tract, not in hard globules, not in solid masses. That is the reason we do not feed the infant on solid food until he is six or eight months of age. We do not give solid food to a six year old child who has diarrhea. We avoid anything that is of a solid mass in the intestinal tract, because it increases the expulsion force.

Q. Do you think there is enough paraffin in a pint of milk to cause any trouble at all?

A. I think anything that is foreign in the intestinal tract, a foreign mass, a physical foreign mass, is detrimen-

tal. The quantity will depend upon the extent of the detrimental part.

1765 Q. You are talking now about infants who are not taking in any food that leaves any fibrous material?

A. Yes.

Q. To cause irritation?

A. Yes, sir, and the premature infant.

Q. Do you think what might be characterized as an infinitesimally small amount of paraffin might cause any damage?

A. No, I don't think so, not such an amount as that, but the amount varies, I understand.

Q. Would you say there is very much in an ordinary drink of milk?

A. No. I would not say there is very much, according to what I have heard.

Q. How much milk would you say would have to be drunk before there might be enough paraffin taken in to cause some damage?

A. If there was a spicule of paraffin in an ounce of milk, it would be in that ounce. I mean, if the paraffin is in a solid form, then it might be in a spoonful, it might be in an ounce.

Q. I mean, how much paraffin would have to be free, say, in a pint of milk?

A. If it is chipped off, if it is a visible quantity, it will not be disseminated through the pint. It will be in

1766 one particular part of the pint.

The Master: Go ahead.

Mr. Schaefer: Q. What are the factors, Doctor, which influence the length of time which living bacteria will survive on paper board?

A. I think the factors are influenced by the manner in which the bacteria are placed on the paper board.

Under ordinary practice, bacteria placed on paper board, in the conversion process, or, at least, where it is manually handled, or where we have contact with humans, or excreta from humans, whether it is hands, droplets, respiratory sneezing and so forth—when we deposit bacteria on paper board that are embedded or enmeshed in saliva or in drops of mucous or in drops of pus from the upper respiratory tract, we are depositing human bacteria, and we are depositing food with the bacteria in the droplets, and it is of such a consistency that it prevents drying. It is a mucous,

pus or serous material and it prevents the desiccation or drying of the bacteria. That is the usual way in which bacteria are deposited. We not only deposit the bacteria, but we deposit the food with it and also the method of preventing desiccation, enmeshed in this tenacious material.

1767 Now, if we place bacteria suspended in water on the surface of cardboard—that is, an artificial experiment—those cellulose fibres or tubes making up the board have a water hunger and they will absorb water rapidly. That is their function, conducting the water by capillary attraction. The board very rapidly absorbs the water. The bacteria die by desiccation on the surface.

Now, if the experiment is so carried out that there are small pieces of board used, say inch square or two-inch square pieces of board used for this artificial inoculation or experiment, then we have a larger edge or raw surface in proportion to the calendered surface, than if we had a piece of board a foot square. It is at the margin, the ends, with loose fibres, where the ends are sticking out, where the rapid absorption takes place. As the board takes up the water, it has such a tremendous water pulling power, as compared with the bacteria, it just dehydrates the bacteria and they disappear very quickly from such a surface. They have no means of protection as they would have if they were inoculated in connection with contagious material, from feces, urine, nose, throat and other sources of human origin.

1768 Q. In your opinion, Doctor, does the use of paper caps for glass bottles present a public health problem which is comparable in significance to the use of paper containers for the distribution of milk?

A. No, I don't think the problem is the same in both at all.

Q. Why, Doctor?

A. I think the paper cap—well, the paper cap is paraffined at a high temperature of about 220 degrees fahrenheit. It is only in contact with the paraffin for a few seconds, not more than three or four or five seconds. The paraffin must be driven into the cap. If it is on the surface, then two caps will stick together as they are put in the tube and the capping machinery in the dairy would not operate, it could not operate if the caps stuck together. So they are what I call dried paraffin. That is, the paraffin is driven in.

Q. Dried paraffin?

A. Dried paraffin. Or, as I say, dried wax, as the commercial men call it. The making of caps is a mechanical operation. They are stamped out of rolls, paraffined in tubes, without being touched. There is little human contact, and there is tremendous rapidity and mass produc-
1769 tion by the machines.

Then, the cap does not come in contact with the milk in the same way that the container does. It is on top of the bottle, and in filling the bottle it can never be filled to the top. You cannot cap it if you fill it to the top.

So ordinarily, in ordinary practice, the milk does not exert pressure against the cap. It may touch the cap or it may slosh against the cap or under certain temperature conditions it may even come up to the cap and press against the cap, but under any condition we do not have the pressure against the cap that we have exerted in the paraffined paper board container that is in contact with the milk for several hours at a time.

Also, it comes in contact with the underneath surface of the cap, which is a smooth, calendered surface. It is not scored. It is not printed. It is very smooth. It would not be absorptive as some parts of the paper container.

Q. Have you an opinion, Doctor, from the point of view of protection of the public health, with respect to the relative hazard involved in the use of paper cups as containers for liquids, like coffee, Coca Cola and other soft
1770 drinks, as compared with the use of paper containers for the distribution of milk?

A. Yes, sir.

Q. What is that opinion, Doctor?

A. I don't think they compare from a public health standpoint.

Q. Why?

A. The use of liquid type containers—that is what they are; they are really liquid type containers—was started early by the health departments to replace the common drinking cup at drinking fountains. That was initiated before we had the constant flowing drinking fountains, and their use in the dispensing of beverages was an outgrowth from their use in replacing the common drinking cup.

The beverages placed in such paper containers only remain in the container a relatively short time. They are not storage containers. The material placed in those containers

does not present the health hazards of bacterial growth that milk presents. That is, they are not growth promoting media.

I think that probably the most important factor is that those containers are not used for food for young infants and young children and therefore present a different
1771 health condition entirely from a public health standpoint.

Q. From the point of view of protection of the public health, have you an opinion as to the relative hazard involved in the use of paper containers for the packaging of ice cream, butter, lard, cottage cheese and other kinds of cheese, oysters and pickles, as compared with the use of paper containers for the delivery of milk?

A. Yes.

Q. What is that opinion, Doctor?

A. I think of the food substances you named, ice cream is the most important one.

We control the ingredients and the sanitary conditions of ice cream by ordinance and the permit system in Chicago, and we insure that the ice cream is made of sanitary products. The ingredients are all under control.

After ice cream is frozen, in a hard state, it is relatively easy to prevent contamination. It is not a growth promoting medium at all. It is too cold.

Our effort is to prevent bacterial contamination where it is a growth promoting medium, that is, before it is frozen. After it is frozen, our method of control is
1772 very simple, because there are very few health hazards connected with ice cream in a frozen state.

Ice cream in a frozen state is solid. When placed in a paper container there is not any liquid bridge; there is not anything there that will convey the substance into the container. The health hazards are not comparable to those in fresh fluid milk, where the container is used for storage.

I think cottage cheese is the same thing. It is produced by the dealer, under permit, and it is a solid.

Now, as to other cheeses, most of the other cheeses that are put into paper containers are solid. They have been seeded with various types of yeast and moulds to produce the particular cheese, and we know that the leaven that they use to make the cheese and the growth of the leaven in the cheese destroys all pathogenic bacteria. It is a solid. It is usually acid in reaction and it presents little health problems on protection from contamination.

Q. What about butter, Doctor?

A. It is difficult to contaminate butter, because of the high fat content. It does not possess a sugar. It pos-
1773 sesses little protein and is very high in fats.

Butter is usually wrapped in oiled paper, ordinary parchment varieties of paper, impregnated with oil, and is put into containers of various types in an oil package, but it is mainly the high fat content, the absence of sugar and the minimum amount of protein that protects butter from outside contamination.

We control the quality of the milk that goes into the butter and we know, like in ice cream, that we have a sanitary product up to the time it is formed into a solid state.

Q. What about lard, Doctor?

A. Lard presents no sanitary hazards at all. It is hard to find bacteria that will grow in lard. It is devoid of protein, devoid of sugars, only containing fats, and the decomposition of lard in bacteria is almost a rarity. It is a curiosity.

Q. What about oysters, Doctor?

A. Probably the first single-service paper container produced was produced for oysters. It was produced in Baltimore between 1875 and 1880. It was a paper container, that we are all familiar with. There is practically the same one used now, where the ends are formed by sticking into a slot, and the paper comes flat, and it is built up into
1774 a container. That has been used for the longest period of time as a single-service container for food products.

The oysters are usually conveyed from the store or the place of purchase to the home in these containers, and are most frequently put into other containers, at any rate they are heated, cooked, before they are used, as the shucked oyster in the market is always used for cooking purposes, so we heat it anyway.

Now, as to pickles, they are in their own preservative. Probably one of the oldest forms of food preservatives. The development of acid in the form of vinegar has been used since 400 years before Christ, so we have there a vehicle that is self-sterilizing and self-preserving.

Q. Do you know the mortality rate, the infant mortality rate, that is, of infants under the age of one year, for the city of Chicago, for the year 1938

A. I looked that up and made a note of it. I can't remember it.

Q. Do you have the note with you, Doctor?
A. Yes.
Q. You may refer to that.
1775 A. In 1938 the infant death rate per thousand living births was 33.7.
Q. That is in the city of Chicago?
A. That is in the city of Chicago for 1938.
Q. And for 1937, what was that rate in the city of Chicago?
A. The infant death rate per thousand living births was 37.8.
Q. What was the infant death rate in the city of New York for the year 1938?
A. The infant death rate per thousand living births in New York City for 1938 was 38.3.
Q. And in New York for 1937?
A. It was 43.7.
Q. What was the infant death rate in Philadelphia for the year 1938?
A. 42.2.
Q. And for the year 1937?
A. 44.6.
Q. Do you have any opinion, Doctor, as to why cream does not rise to the top of the container when it is put into a paper milk container?
A. No, I don't think I do. The cream rising to the top is a very complex physical chemical problem. It does it all the time and we don't think much about it, but we still
1776 do not understand all the principles involved.
Q. Is Mr. George D. Scott a friend of yours, Doctor?
A. Yes, sir.
Q. Mr. Scott is connected with the Ex-Cell-O Corporation?
A. Yes, sir.
Q. Do you know what his capacity is there?
A. I do not know.
Q. Did you have any conversations with Mr. Scott with respect to the Pure-Pak paper container?
A. Yes, sir.
Q. When did you have those conversations?
A. I think it was the last week in October, in 1938.
Q. Where was that?
A. Mr. Scott phoned me from some place in Chicago to

my office at the University, said he wanted to see me about paper containers. I do not just recall the conversation, but I gathered from him that he wanted to see me about paper containers, that my name had been suggested to him on a recent visit to the Chicago Board of Health.

Q. And as a result of that conversation did you see Mr. Scott?

A. Yes, sir. He came out to the University and saw me in my office there.

Q. What was the substance of your conversation
1777 with him there?

A. As I recall, Mr. Scott was there for about two hours. He went over the history of how the Ex-Cell-O Corporation became interested in making and merchandising a dairy machine and emphasized that he or anyone connected with the Ex-Cell-O Corporation were experienced in dairy work or in public health work.

Q. Were experienced?

Mr. Gariepy: Were or were not?

The Witness: A. Were not. He emphasized that there was no one in the organization with that background and experience.

The Master: Q. Who emphasized that?

A. Mr. Scott.

Q. Yes.

A. And he came to me to get me to help him in presenting his material to the Chicago Board of Health. He had a suitcase full of material, probably fifty or sixty pamphlets, articles, some typewritten—

Mr. Schaefer: Q. Did he have that with him at your office?

A. He had that with him. He wanted this material summarized into a tangible, understandable report form.

Q. Was anything said at that meeting about com-
1778 pensation?

A. No, sir.

Q. Did you undertake at that meeting to do any work for Mr. Scott?

A. No, I did not. I told Mr. Scott if he wanted to leave his material with me I would go over it and see what it was all about, see what was in there that I could use, if anything, and for him to see me again or contact me again in about a week.

Q. Did he contact you again in about a week?

A. Yes, sir. About the first week in November.
Q. Where did you see him then?
A. I saw him at the Palmer House.
Q. What was the substance of your conversation then?
A. I told him that I thought that I could get some material out of what he had left me. A great deal of it was more of sales value than any value that I could use it for, but some of it was useful.

I also told him that I would have to have more personal contact, that I would like to see one of the machines, at least, see it in operation, and that I wanted to consult with Dr. Breed and Dr. Sanborn about paper, what progress they had made on the sanitary quality of paper, since
1779 I had seen their last bulletins.

The Master: Q. What was the purpose of your activity in this matter?
A. It was to correlate into a tangible, understandable report a group of isolated writings and reports that Mr. Scott had in his suitcase, that he gave to me at the time.
Q. Were you to state your opinion, too?
A. I told him I would state my opinion if I had one to offer, but I would have to see the machines and make some personal observations before I could state my own opinion.

Mr. Schaefer: Q. You understood, didn't you, Doctor, when he was consulting you that he was interested in securing permission to sell that type of container in the city of Chicago?
A. Yes.
Q. And that it was for that purpose that he consulted you?
A. Yes, sir.
Q. At that time were you a member of the Board of Health of the City of Chicago?
A. No, sir.
Q. Now, have you completed your statement as to the substance of the conversation at the Palmer House
1780 between yourself and Mr. Scott.

A. Well, the conversation, as I mentioned, went to that point. I suggested to him that the report made should be considered as a preliminary report, and that undoubtedly there would be other problems come up in relation to the container, and suggested, just as a tentative outline, that we consider about four months the duration of our contact and I told him a reasonable sum would be a

thousand dollars for the four months' service, which he said was agreeable.

Q. When did you next see Mr. Scott?

A. I next saw Mr. Scott in Geneva, New York, in Dr. Breed's and Dr. Sanborn's laboratory.

Q. What did you do there with him?

A. That was about the middle of November.

Q. Of what year?

A. 1938. I arrived at Geneva—

Q. Are you sure of the year, Doctor?

A. 1937. I beg your pardon. This was all 1937 and not 1938. When I first saw Mr. Scott it was the last week in October, 1937. If I said 1938, I was in error.

Q. What did you do there with him, I asked you?

A. I arrived in Geneva in the morning and Mr. Scott came in about noon. I spent the morning, as well as the afternoon, with Dr. Breed and Dr. Sanborn. I have
1781 known Dr. Breed for twenty years and have known Dr. Sanborn for two or three years.

I went over the results that they had obtained since the publication of their last bulletins and noted the improvement in the sanitary quality of paper board, as they were finding it in their analysis, that was sent to them from various sources. There was a constant improvement since their last report in the sanitary quality of paper board. I was particularly interested in the Cherry River mill board. The last report they had was about two months old or three months old. I suggested that they get a very recent report to see whether it was holding up the same or different. Dr. Sanborn and Mr. Scott left Geneva that night and went to Cherry River and completed the sanitary survey of the mill and the paper board.

Q. What did you do?

A. I came on back to Chicago.

Q. Did you see Mr. Scott again?

A. I saw Mr. Scott in Detroit about a week after that. I went to Detroit for two purposes. One was to see the Pure-Pak machine in operation in a dairy in Detroit. The second thing was to talk to Dr. Vaughn, the health officer of Detroit, whom I have known for a number of years,
1782 relative to paper containers for milk, and his experience with them in Detroit.

I saw the Pure-Pak machine in operation, watched it all one morning. I spent the afternoon with the health department.

Q. Then what did you do, Doctor?

A. I came back to Chicago again. From that material that Mr. Scott had left with me and my observations at Geneva and Detroit, I wrote my report.

Q. And that report is the document which is Plaintiff's Exhibit 4 in this case?

A. Yes, sir.

Q. And what did you do with the report after you had written it, Doctor?

A. After I wrote the report I asked Mr. Scott whether he wanted me to submit it to the Health Department or whether he wanted to do it. He asked me to. I took it down to Mr. Krueger at the Chicago Board of Health.

Q. Thereafter, did you discuss that report with Dr. Bundesen, the president of the Board of Health?

A. Yes, sir.

Q. Where was that?

A. In his office, in the Chicago Board of Health.

Q. What was the substance of the conversation there?

1783 A. Dr. Bundesen was most concerned about the sanitary qualities of the paper board.

Mr. Gariepy: That is not responsive to the question. He asked for the conversation, Master. That is his conclusion.

Mr. Schaefer: Q. What did Dr. Bundesen say, in substance, and what did you say, Doctor?

A. Dr. Bundesen asked me if the paper board was sterile. I told him no, it was not sterile, but that I thought it could be made sterile, that it was not sterile at this time.

The next thing he asked me was what were the advantages of the paper container, that is, a single-service container for milk.

I told him I thought it had many advantages, like the advantages in a quarantined home. It was certainly a public health service there, to prevent any possibility of dissemination of contagion. It was of advantage in hospitals, and particularly in the Contagious Disease Hospital, where we had one floor filled with scarlet fever patients and one floor of measles and one floor diphtheria, where, regardless of the best of care we sometimes get cross infection. If we had single-service containers we most probably could eliminate at least the drinking

1784 glass for milk as one of the sources. Also its use in

the General Hospital, where we have to boil every glass, would be an advantage. Those were some of the advantages I pointed out to him.

Q. Doctor, were those the advantages to which you referred when you said in Plaintiff's Exhibit 4: "From my personal investigations and observations I see many advantages to the single-service paraffin-coated milk container for fresh fluid milk."?

A. Yes. That was the paragraph that Dr. Bundesen asked me to explain.

Q. How much time did you spend in connection with the preparation and presentation of this report?

A. With those two, one trip to Geneva and one to Detroit, I would say not more than five or six days, not more than that.

Q. And for your services, how much were you paid by the Ex-Cell-O Company?

A. Two hundred and fifty dollars, and my expenses on these two trips.

Q. Did you ever state in a telephone conversation, or otherwise, to Mr. Scott that you had never taken such a lashing from anybody in your life as you had taken from Dr. Bundesen, because you proceeded with the gath-
1785 ering of this data on behalf of Pure-Pak, without first consulting Dr. Bundesen personally?

A. No, I don't remember saying that.

Q. Now, Doctor, at the time when you prepared Plaintiff's Exhibit 4, what had been your experience with the bacteriology and the sanitation of paper?

A. I had had about nine years experience with the Kimberly-Clark Corporation.

Q. What type of products does the Kimberly-Clark Corporation manufacture?

A. They manufacture a variety of paper products. I was associated with all of their products, but primarily with one product, which is their disposable tissue division, which makes Kleenex, a disposable tissue and also makes a disposable sanitary napkin called Kotex, and similar products of disposable tissue. I have been a consultant of Kimberly-Clark since 1928.

Q. Now, in addition to your experience as a consultant to Kimberly-Clark, what experience had you had with paper at the time you prepared Plaintiff's Exhibit 4?

A. I had had none, except with Kimberly-Clark.

Q. After the presentation of Plaintiff's Exhibit 4,

did you have any experience with the manufacture of paper board for use in paper milk containers?

1786 A. Yes, sir.

Q. Will you describe what that experience was?

A. From June, 1938, up to December, 1938, I was a consultant to the Sealright Company, Fulton, New York, who make paper containers for food and for milk.

Q. Did Sealright pay you for that work?

A. Yes.

Q. Specifically, what did you do as a consultant for the Sealrite Company?

A. The first thing I did was to have them built and equip a bacteriological laboratory.

Q. Where, Doctor?

A. In Fulton, at their plant.

Q. Fulton, New York?

A. Fulton, New York, yes sir. They built and equipped a bacteriological laboratory, employed two bacteriologists to man it, and we began a thorough sanitary survey of everything, from the log pile to the finished container, to determine what kind of a sanitary program we should inaugurate, where our hazards were and what they were. That was my primary purpose.

Q. And how long did you remain there?

A. I remained there until I became a member of the Board of Health. I resigned when I was appointed

1787 to the Board of Health.

Q. Can you tell me some of the things which you did in connection with your work for the Sealrite Corporation, with respect to their sanitary program?

A. Well, I supervised all of the laboratory work and also inaugurated an educational system or personal hygiene in the mill and conversion personnel.

Q. At the time when you said in your report, which is Plaintiff's Exhibit 4, "Cardboard of a satisfactory sanitary quality can be obtained and used for this purpose," meaning the manufacture of single-service containers for milk, upon what experience was that opinion based?

A. When I was talking to Dr. Breed and Dr. Sanborn in Geneva, I noted that some of their disintegration counts of board showed no bacterial growth. That substantiated what I had in mind, and that was producing a sterile board. That idea or that conception was based upon my experience with Kimberly-Clark.

At Kimberly-Clark, we succeeded in producing sterile

disposable tissue. Thousands of samples of Kleenex, a variety of sheets, have been taken over a number of years, and it is always sterile when it comes off the dryer.

1788 I thought it was possible to do the same thing with cardboard, because we accomplished that at Kimberly-Clark by slowing down the sheet going through the dryer or increasing the dryer capacity. We dessicated the sheet. When the sheet comes off, at the Kimberly-Clark Corporation, it contains less than one-half of one per cent water, and it is sterile.

I though I could do the same thing with paper board, by proceeding along the same general principles, but when I got into the paper board mill I found that I could not do that.

You cannot do it for the reason that the paper board that has less than five per cent water is difficult to convert, that if you score it you crack it, it is so brittle. It requires five per cent water, approximately, to give it the resiliency or give it the bending power necessary for conversion without breaking it, like you would break a stick.

Of course, the same problem comes up in connection with the thin tissues. They cannot be converted when they are taken off the drier with so low a moisture content, but you only have to put them in an air-conditioned room for two or three hours and the thin tissue takes

1789 up moisture to any degree you want to take it up.

But a paper board requires months to attain that degree of moisture content, particularly tight rolls, if you have rolls. So I found the experience I had at Kimberly-Clark I could not transfer to the paper board mill at all.

Q. While you were working at the Sealrite Corporation, did your experience cause you to change your opinion with respect to the possibility of producing a paraffined paper container for milk which was satisfactory from a public health point of view?

A. Yes.

Q. Did you ever express that opinion to anyone?

A. Yes.

Q. To whom?

A. I have expressed to several people, including Mr. Skinner.

Q. Who is Mr. Skinner?

A. The president of the Sealrite Corporation. E. W.

Skinner, the president of the Sealrite Company, Fulton, New York.

Q. Did you ever express that opinion to Mr. Skinner in writing?

A. I think I did, yes, sir. I am sure I did, but most of our—

Mr. Garicpy: I object. He has answered the question. He said he did in writing. That is responsive.

Mr. Schaefer: Q. Did you also express that opin-
1790 ion orally?

A. Yes, repeatedly orally, with quite long discussions.

Q. With anyone other than Mr. Skinner?

A. Yes, sir.

Q. Who were some of the other people to whom you expressed that opinion?

The Master: What opinion is this?

Mr. Schaefer: This is the opinion that a paraffined paper container for milk or for fresh fluid milk cannot be made so it is satisfactory from a public health point of view.

The Witness: A. Yes. With the vice-president, Mr. Dolphin.

The Master: Q. Vice-president of what concern?

A. Of the Sealrite Company. The chief chemist of the Sealrite Company, Robert Huntley. The chief engineer, Mr. Price.

Q. Was that before you became a member of the Board of Health?

A. Yes, six months before.

Mr. Schaefer: Q. And was that at the time when you were being paid by Sealrite Corporation as a consultant?

A. Yes, sir.

Q. How much were they paying you, Doctor?

A. Five hundred dollars a month.

1791 Mr. Schaefer: Cross-examine.

Mr. Gariepy: If the Master please, we have been exactly three hours on direct examination, and it is going to take a considerable time to cross-examine. May I suggest that we adjourn until Friday? It is impossible for me to go ahead today and do justice to the cross-examination on behalf of my client. I believe this is the first time we have asked for any delay in the examination of any witness.

The Master: Have you any objection to that, Mr. Schaefer?

Mr. Schaefer: Well, I am very anxious to proceed. We are sitting here for three days. I want to conclude the case as soon as possible.

The Master: Is this your last witness?

Mr. Schaefer: I think so, yes, sir.

Mr. Gariepy: If counsel is objecting, I suggest he put on his other witness and proceed, and I might be able to cross-examine him this afternoon, if he wants to go ahead, but I want to reserve my cross-examination of this Doctor until Friday.

The Master: Do you have some other things you want to put in, Mr. Schaefer?

Mr. Schaefer: I have some other things that I want to take up with you, yes, sir. As to other witnesses,
1792 I think not. It depends on the cross-examination of Dr. Arnold.

The Master: Well, as I recall it, you made a similar request before.

Mr. Schaefer: That is right, yes, sir.

The Master: In regard to some other witness they put on.

Mr. Schaefer: I recall a long speech too, at the time, unless my recollection fails me, a rather vehement protest.

The Master: Well, of course, the decison was made at that time and I suppose the same decision will apply to this. Suppose we give them until Friday morning at 9:30.

Mr. Schaefer: All right, sir.

Whereupon the further hearing of the above entitled cause was adjourned to 9:30 o'clock a. m. of the following day, Friday, October 13, 1939.

1793 • • (Caption—) • •

Friday, October 13, 1939,
9:30 o'clock a. m.

Met, pursuant to adjournment.
Present:

Mr. Gariepy, Mr. Rall, Mr. Schaefer, Mr. Horan.

1794 The Master: You may proceed with your cross-examination, Mr. Gariepy.

LLOYD ARNOLD a witness called by the defendants, having been heretofore duly sworn, resumed the stand and testified further as follows:

Cross-Examination by Mr. Gariepy.

Q. Dr. Arnold, you have attended all of the hearings we have held before Master Grossman, since the filing of this suit on February 2nd, have you not?

A. I believe I have.

Q. Did you attend with Mr. Schaefer the taking of the depositions in April, 1939, at Philadelphia and New York City?

A. Yes, sir.

Q. Why did you attend said hearings here and the depositions in the two places?

A. I considered myself a defendant in the case and I was interested in it and I was concerned about it.

Q. Were there any other members of the Board of Health in attendance at the hearing before the Master and the Commissioner on the taking of depositions, up to date?

A. Not that I know of.

1795 Q. Did I understand you to say that you now receive $500 a month salary in the dairy division or as consultant to the Board of Health, which is it?

A. I don't know exactly how it would be defined. I started out as consultant—as the responsible head of the dairy division, at the time Mr. Krueger and Mr. Guerin took their leaves of absence. Then when I returned I was asked to continue in relation to the modification and reorganization of the new proposed milk ordinance.

Q. And are you still received $500 a month at this time?

A. Yes, sir.

Q. And that covers, of course, services attending in the hearings here and services on the depositions?

A. I presume so.

The Master: Q. What is your salary as a member of the Board of Health?

A. Nothing, sir.

Mr. Gariepy: Q. Were your expenses in taking the depositions or at the time you attended the taking of the depositions paid by the Board of Health or were they paid by you out of your salary?

A. No, they were paid by the Board of Health.

Q. You said on direct that you did considerable 1796 research work, Doctor.

A. Yes.

Q. Have you done and do you now do research work for Proctor & Gamble Company?

A. No, sir.

Q. Do you do research for the Brassert Company on Michigan Avenue?

A. No, sir.

Q. Have you ever done any research work for them?

A. For Brassert?

Q. Yes.

A. No.

Q. Have you done it for Proctor & Gamble?

A. Yes.

Q. Did you do it through the Brassert Company's office on Michigan Avenue?

A. No. The contact was made through the office, but I did not have—

Q. Through Brassert's office?

A. Yes.

Q. And who in Brassert's office?

A. Mr. Woit.

Q. That was in connection with some soap, was it not?

A. Yes, sir.

Q. That is in the Straus Building?

A. Yes.

Q. What was your return, in the way of financial return, from the work you did for Proctor & Gamble, and when was it?

Mr. Schaefer: That is objected to.

1797 The Master: Objection sustained.

Mr. Gariepy: Q. Are you doing any work for them now?

A. No, sir.

Q. Did you do some research work or outside work, as you call it, for the Associated Milk Dealers, Inc.?

A. Yes.

Q. When?

A. I think that began in December, 1937, or January, 1938, and lasted about a year, or maybe 15 months.

Q. Who financed that research work?

A. The Associated Milk Dealers of Chicago.

Q. Was that a grant to the University of Illinois?

A. To the University, yes.

Q. Is that a similar type of a grant or a deposit of funds as is made at Cornell University that you heard testified to by Dr. Sanborn here?

A. I presume it is, yes.

Q. How much of this 20 per cent time that you say is allowed to you by your contract with the University have you expended in attending the hearings here in this case?

Mr. Schaefer: That is objected to.

The Master: I will let him answer.

1798 The Witness: A. I could not say. I have not kept any track of it.

Mr. Gariepy: Q. You say you have a contract with the University for 80 per cent of your time to the University and 20 per cent outside?

A. Yes.

Q. Is that in the form of a written contract?

A. Yes.

Q. Did you receive notification from Dean Davis—he is your dean, isn't he?

A. Yes.

Q. (Continuing) —on December 2, 1938, concerning the devoting of time to the University work and calling your attention to your time on the outside of 20 per cent?

Mr. Schaefer: That is objected to.

The Master: Sustained.

Mr. Gariepy: Q. Did you ever have any communication with Dean Davis with regard to your using time that you were supposed to use at the University, for outside work?

Mr. Schaefer: That is objected to.

The Master: Sustained.

Mr. Gariepy: Q. Have you been assigned by the Board

of Health of the City of Chicago to assist Mr. Schaefer in the defense of this lawsuit?

1799 A. I think I have. That is my understanding.

Q. By whom were you assigned?

A. By the president of the Board of Health and by the Board, too, I think. That was my understanding.

Q. Was there a formal resolution passed or letter given to you?

A. I do not recall anything formal about it.

Q. Has anyone been assigned by the Board of Health to assist you in the defense of this lawsuit?

A. Not that I know of.

Q. What have you done to assist counsel for the defense here, besides attending the hearings in this cause?

Mr. Schaefer: That is objected to.

The Master: I think he may answer.

The Witness: A. Why, I have consulted with him whenever it was necessary or whenever I was requested to.

Mr. Gariepy: Q. That was frequently during the hearings and in recesses?

A. Yes, sir.

Q. Is it not a fact that you prepared a list of questions that were asked you yesterday?

A. No.

Q. Did you aid in the preparation of that list?

A. No.

1800 Q. Did you prepare a list of questions that were asked witnesses for the plaintiff on cross-examination?

A. I consulted with Mr. Schaefer in their preparation.

Q. How many various commercial concerns are you doing research work for at this time, drawing on this 20 per cent schedule that you have?

Mr. Schaefer: That is objected to.

The Master: Oh, I will let him answer.

The Witness: One.

Mr. Gariepy: Q. Who is that?

A. Kimberly-Clark.

Q. Are you doing any work for the Sealrite Company at this time?

A. No, sir.

Q. Do you work for the United Fruit Company?

A. No, sir.

Q. Have you done work for them, research work?

A. Yes.

Q. How about the Laundry Institute, near Joliet? Do you do research work for them?

A. No, [redacted].

Q. Have you done it?

A. Yes, sir.

Q. Are you connected with the State Department of Health, the Chicago branch, at this time?

A. No, sir.

Q. I understood you yesterday to say that you were
1801 appointed on the Advisory Board for the State Department of Health concerning the rules and regulations for public health, is that right?

A. No, sir. That is a committee.

Q. On that committee?

A. That each director appoints to revise and bring the rules up to date.

Q. Does this compensation that you receive for research work go through the University or is it paid direct to you?

A. Paid direct to me.

Q. What is your salary, as bacteriologist and professor of public health at the University of Illinois?

A. I think it is $5,280, something in that neighborhood.

Q. Is it not $5,140?

A. That may be it.

Q. And how much work have you done or how much money do you receive or have you received during the past year for research work you have done on the outside?

Mr. Schaefer: That is objected to.

The Master: Sustained.

Mr. Gariepy: Q. What date did you take over responsibility for the dairy division of the Board of Health of the city?

A. In December, sometime. I don't remember the date.

The Master: Q. What year?

A. 1938.

1802 Mr. Gariepy: Q. Are Dr. White, Mr. Martinek and Mr. Rudig working under your direction in the Board of Health in regard to the single-service container?

A. No, sir.

Q. Under whose direction are they working, if you know?

A. I think they are working under Dr. White's direction.

Q. Do you know at whose suggestion the various tests

or experiments performed by Mr. Martinek and Mr. Rudig were made in 1939?

A. I don't know specifically at whose suggestion it was done.

Q. Did I understand you correctly on direct examination to say that you spent each afternoon with the dairy inspectors?

A. No. In the Board of Health, when I was in charge of or responsible for the dairy division, I was there every afternoon.

Q. Are you still responsible for it?

A. No, sir.

Q. Do the inspectors report to you now every day?

A. No, sir.

Q. Or every other day?

A. No, sir.

Q. They do not?

A. No, sir.

1803 Q. What revisions of the proposed Mayor Kelly milk ordinance and various parts of it are proposed to conform to the United States Public Health Service?

Mr. Schaefer: That is objected to.

The Master: I will sustain the objection.

Mr. Gariepy: Q. You said that there were going to be proposals affecting the Mayor Kelly milk ordinance, is that right, on direct examination?

A. There were going to be proposals?

Q. Proposals for the revision of the Mayor Kelly milk ordinance.

A. I am working on various forms of revision. It is purely in tentative form. There are two or three different forms for each paragraph, or something of that nature. It is just tentative.

Q. What revisions are in contemplation?

Mr. Schaefer: That is objected to.

The Master: What is the materiality of that?

Mr. Gariepy: Q. By you. What revisons do you contemplate making in the Mayor Kelly milk ordinance?

Mr. Schaefer: That is objected to.

The Witness: A. I don't know at the present time.

The Master: He doesn't know at the present time.

Mr. Schaefer: Sir?

1804 The Master: He doesn't know at the present time, he said.

Mr. Gariepy: Q. In what respect does the Mayor Kelly

milk ordinance now not conform to the United States Public Health Service standards or suggestions?

Mr. Schaefer: That is objected to.

The Master: I will let him answer.

Mr. Schaefer: It doesn't make any difference whether they conform or don't conform.

Mr. Gariepy: You opened the door on it, Mr. Schaefer.

The Master: I will let him answer,

The Witness: A. That is a great deal. To answer that one would have to take the ordinance page by page, in order to answer that question.

Mr. Gariepy: Q. You cannot answer it?

A. No, I cannot answer the question,

Q. When were these contemplated revisions decided upon?

The Master: He has answered that he doesn't know what the revisions are going to be.

Mr. Gariepy: Q. When did you start on these proposed revisions, then? You said you started on tentative proposed revisions.

1805 A. I started on them last December.

Q. 1938?

A. Yes, sir.

Q. You said that more than 50 per cent of fresh fluid milk was taken or drunk by children under 12 years of age. What per cent is consumed by children under 1 year of age?

A. That I don't believe I could answer.

Q. Your figures on comparative death rates were for children one year old, weren't they?

A. They were children who had not reached their first birthday.

Q. Do you have any slightest reason, inference or suspicion to believe that any part of the Philadelphia or New York death rate was due to the sale of milk in single-service containers in said cities?

A. I have no evidence.

Q. Why did you quote those figures on direct examination concerning the death rates in those two cities then, Doctor?

Mr. Schaefer: It is obvious; the question was asked.

The Master: Objection sustained.

Mr. Gariepy: Q. What relation has those figures, Doctor, to the matter of the milk control or the sale of milk in single-service containers, if any?

Mr. Schaefer: That is objected to.

1806 The Master: Objection sustained.

Mr. Gariepy: Q. Do you consider that these figures with regard to the death rates have any relationship to the sale of milk in those cities, in single-service containers, as compared with the sale of milk in the city of Chicago in glass containers?

A. I don't know.

Q. Is not evaporated milk used in the feeding of babies in at least 50 per cent of the cases?

A. I could not answer that.

Q. Is not the fluid milk used in the care of babies sterilized before being used?

A. It depends upon the formula the mother is using. It is sometimes boiled and sometimes not.

Q. What is the customary thing in the feeding of babies, Doctor, under one year of age?

A. It depends upon the pediatrician. Some of them do boil it and some do not.

Q. What is your experience and knowledge with regard to what per cent boil the milk before they give it to the baby and what per cent give it to them cold and raw?

A. They warm it up. I don't know whether they all boil it or not. I am not familiar with that.

1807 Q. You are not a pediatrician then, Doctor, are you?

A. No, sir.

Q. Do you know the death rate for the years 1937 and 1938 for the city of San Francisco?

A. No, sir.

Q. The city of Los Angeles?

A. No.

Q. Do you know whether or not the city of San Francisco permitted the use of single-service containers during the past year, 1938?

A. I do not know.

Q. I ask you the same question with regard to the city of Los Angeles.

A. I do not know, no, sir.

Q. Do you have any figures or statistics from the Bureau of Vital Statistics of any city with regard to a showing that the death rate in cities using the single-service containers is brought about by reason of its use?

A. I know of no such information available.

Q. Can you recite one instance, Doctor, of an infant's death or an increase in deaths attributable to the use of milk or the sale of milk in single-service containers?

A. I have no such published reports.

Q. The single-service container has been in use
1808 in some cities for at least ten years, has it not?

A. I don't know. I could not answer that question.

Q. How long do you know the single-service container has been used, for instance, in New York City?

A. I don't know when they began?

Q. Do you know in Philadelphia?

A. No, sir.

Q. Do you know how many cities are using the single-service container at this time?

A. No, I do not.

Q. Do you know of a single instance, of your own knowledge, or from your contact with public health officials, or from reading medical journals and publications on public health, of any kind, of any instance, where disease or death or cholera or epidemic was attributable or suspected to be caused by the use of single-service containers?

A. No, I do not.

Q. You do know that there were instances of the communication of disease suspected to arise from the handling and reuse of glass milk bottles, don't you?

A. It has been suspected, yes.

Q. In your professional career, have you ever seen glass milk bottles used for the containing of foreign
1809 substances, such as turpentine, varnish or human excreta, such as urine and feces?

A. Yes.

Q. Do you consider the bacteriological control of glass milk bottles perfect?

A. No.

Q. You try to prevent glass milk bottles being returned from quarantined residences because of a recognition that the bottling and washing techniques do not always result in sterility, do you not?

A. No, sir.

Q. What do you do?

A. We do not allow the bottles to be returned until the quarantine has been discontinued.

Q. For what reason?

A. Then those bottles are all handled separately. Our main reason for that is that we do not want a bottle that may have disease producing germs on it handled by people who are going to handle other bottles. It is not the difficulty of cleaning the bottle. It is the difficulty of cross contamination before the bottle is cleaned.

Q. Then the glass milk bottle is a source of contamination, is it not?

A. Anything is a source of contamination.

Q. Is this one of the reasons that you enumerated or mentioned yesterday, as advantages in the use of
1810 single-service containers, that were mentioned by you in your conference with Dr. Bundesen on or about December 4, 1937?

A. Yes, sir.

Q. Then in that respect the single-service container promotes public health and protects it, doesn't it?

A. Yes, sir.

Q. Where the glass bottle does not do so?

A. It certain does, yes.

The Master: Q. Is that the public health of the consumers of milk or is it the public health of the washers of the bottles or other handlers of the bottles before they are washed; which do you mean, or do you mean both?

A. What I mean, Master, is that it will assist us in restricting the distribution of the causitive agents of the communicable diseases which we quarantine. If we can use single-service containers, it will help us to localize the contagious material and will prevent the possibility of spread.

Q. Spread to whom?

A. To other people, the population.

Q. That is, the users of milk in bottles?

A. The users of milk in bottles. It will prevent contamination of the milk supply and will prevent the
1811 drivers from contaminating door knobs as they go in and out. If they pick up a bottle from a quarantined premises and take a hold of the door handle next door, they might contaminate it.

Q. Or they might contaminate the bottle that they are going to put on the door step next door?

A. Yes, sir.

Mr. Gariepy: Q. And this reuse and constant passage of this bottle is what you call this cross contamination, is it?

A. The dirty bottle, yes, the ones that have not been cleaned.

The Master: Q. I want to get this straight now.

A. Yes, sir.

Q. Do you include in your contamination possibilities, the use of that identical bottle after it has been washed?

A. No, sir.

Q. In other words, if a bottle has been used on quarantined premises and is taken in by a milk driver and then washed in the ordinary course or ordinary routine, do you think that that bottle has any disease spreading possibilities?

A. No, sir.

1812 Q. Do you confine your disease spreading possibilities to the driver, then?

A. No. To the bottle before it is washed. The danger is between the quarantined premises and the washing machine.

Q. And everybody that handles it up to that time?

A. Yes, sir.

Mr. Gariepy: Q. You give these bottles from quarantined places a special treatment, do you not?

A. Yes, sir.

Q. And why do you give them special treatment?

A. Because we want to be doubly cautious.

Q. Then ordinary treatment is not sufficient caution?

A. It is sufficient caution, but we want a double caution when we know we are dealing with contaminated material.

Q. What importance, in determining the public health hazard or public health advantage of the paper bottle, have you given to the fact that it is used only once and then destroyed?

A. I didn't understand that.

Mr. Gariepy: Read it.

(Mr. Gariepy's question was read by the reporter as above recorded.)

1813 Mr. Gariepy: Q. Is that of public health significance?

A. Yes.

Q. Does not this advantage of the single-service container outweigh, from the standpoint of possible public health hazard, assuming, of course, the use of disintegration tests on the paper board from time to time by the best technique that you know, the bare possibility that in some instances the disintegration tests might not be entirely accurate?

Mr. Schaefer: Will you read that, Mr. Reporter? I didn't get it.

(Mr. Gariepy's last question was read by the reporter as above recorded.)

The Witness: A. No, I don't think so.

Mr. Gariepy: Q. Is it not more likely that the glass milk bottles which are used many, many times, are more likely to be subject to contamination by human bacteria, which you described as the dangerous type, than the single-service container?

A. I don't think so, sir.

Q. Do you know that numerous cities and municipalities have provisions and restrictions in their ordinances with regard to the type of containers of milk being used or sent to homes where contagious disease exists?

1814 A. Yes.

Q. And for what purpose do you think that is in there?

A. For the purpose of restricting the distribution of the causative agent of the disease. The single-service container is of advantage there.

Q. In determining the relative health hazard in the use of the glass bottle as compared with the single-service container of the Pure-Pak type, what weight have you given to the fact that the containers are exposed to contamination during the filling operation, referring to the paper container, for only a fraction of the time that the glass bottle is exposed to the filling operation?

A. I don't see where the health hazard of a filling operation comes in.

Q. Is not the exposure of the container to bacteria in the air a period of time an element to be considered concerning the sanitary assets of each container?

A. Yes, but the filling time is short.

Q. And isn't there bacteria in the air all during that time?

A. There are some bacteria in the air all the time, yes.

1815 Q. And that bacteria may settle upon the container?

A. It is possible.

Q. On the bottle?

A. It is possible, yes.

Q. And how much time, do you know, is the Pure-Pak container exposed to the air or contamination from the air during the filling process, how many seconds?

A. I do not know.

Q. How about the glass bottle; how much time is it exposed to contamination from the air?

A. That depends upon the speed of the filling machine.

Q. What is the usual, customary speed of a filling machine, Doctor?

A. From 90 a minute to 140 a minute.

Q. Is it not a fact that the glass bottles opened in the room are exposed for a much longer period of time after their last process of sterilization until they are filled, sterilized and capped again, than is the Pure-Pak milk bottle?

A. I don't know.

Q. That is a health hazard, is it not?

A. No, I don't think so. I would not call it that?

Q. Is it not a health problem?

A. With due care it can be controlled.

Q. Is it not a health problem, I am asking you?

1816 A. No.

Q. Is it not a fact that during the Pure-Pak operation on the Ex-Cell-O machine the paper container is almost continually enclosed in a covered machine, so it is not exposed to human contamination for more than a fraction of the time that a glass milk bottle is exposed in the typical glass bottle operation, in filling?

A. I think so, yes.

Q. Why is not the power to test cartons after they come to the dairy as adequate a method of bacteriological control as is testing 1400 glass milk bottles out of hundreds of millions used yearly in the city of Chicago?

A. I don't get that question.

Mr. Gariepy: Read it, Mr. Reporter.

(Mr. Gariepy's last question was read by the reporter as above recorded.)

The Witness: A. No. I do not think a glass milk bottle—well, the rinse test we carry out is only part of our general inspection system. We do not rely upon that entirely. The milk is under our control from the cow to the consumer and the glass bottle is just the consumer's package. On the disintegration tests, I don't believe we could get the information from that, because we
1817 would not know the source of the paper, we would not know whether it came from the same place or different places or anything about it.

Q. You have the same inspection of the dairies and the cows and the equipment in the paper bottle factory or paper bottle dairy that dispenses milk in paper bottles that you have in one that dispenses it in glass, don't you?

A. From the dairy standpoint, but not from the container.

Q. You check the cows and the cleanliness of the stalls and everything else?

A. Yes.

Q. Just as Mr. Woodman from Evanston said?

A. Yes.

Q. There are not any different methods that were employed, is there?

A. No, not in the dairy part.

Q. Has the Board of Health of the city of Chicago made comparable bacteria counts on milk in glass containers and milk in paper containers from the same dairies?

A. I don't think so, no.

Q. Is not the object of milk sanitary regulations to deliver uncontaminated and as nearly as possible bacteria-free milk to the ultimate consumer as is reasonably possible, considering the necessities of the practical op-
1818 eration and of the practical milk sanitary regulations?

A. I think so.

Q. In other words, the proof of the pudding is in the eating?

A. No, I wouldn't say that.

Q. But you did not make any comparative tests on this milk, then, in the glass containers, as compared with the milk in the paper containers at the same dairies, did you?

A. No. I don't know a dairy that has the two operations in it.

Q. Do you know the Bowman Dairy?
A. Yes.
Q. Do you know the Borden Dairy?
A. Yes.
Q. Do you know that they are selling milk in glass containers as well as in paper containers?
A. I didn't know it was at the same plant. I didn't know the same vat of milk would empty into two lines, one going into the paper filling machine and one into the glass filling machine, and that is the only way you can compare the two, is to fill them from the same vat.
Q. The dairy, then, would have a substantially different quality of milk in one vat from the other, so you could not make a comparable test, is that it?
1819 A. You could not make a comparable test.
Q. Or reliable test?
A. Reliable for that vat, yes, but not comparable to another vat of milk.
Q. Do you have any authorities or statistics that the bacteria count in milk in paper containers is higher than the bacteria count in milk sold in glass containers?
A. No, I don't think so.
Q. Did you ever advise the Board of Health to make those comparable tests on milk in the two containers at the same dairy?
A. I don't think so.
Q. You would remember whether you ever gave them such advice or suggestion, wouldn't you?
A. I think so, yes.
Q. Mr. Martinek testified here that the paper containers which he received were first sent to the bacteriologist and emptied of milk. What, if anything, did you instruct the bacteriologist to do with the milk?
A. Nothing that I know of.
Q. Why should the filled paper container have gone to the bacteriologist to be emptied, if only tests were to be made on the paper board?
1820 A. I do not know.
Q. Your disapproval, as you expressed it yesterday on direct examination, of the paper milk container at this time is based entirely on your statement that essentially sterile milk container board cannot be manufactured, is that correct?
A. No, that is not the total answer.

Q. Well, can it be manufactured?

A. I don't think so, consistently.

Q. And the reason you say that it cannot be manufactured, that is, sterile board for paper containers cannot be manufactured consistently, is that it must contain five per cent of water in order to take the scoring, is that it?

A. No, that is not exactly it. At least, that was not just what I meant.

Q. Then tell us why that five per cent item of water enters into the paper board? You said it was necessary for scoring.

A. It is. It has to be that for scoring, and if you put it over the dryer system long enough to get the maximum killing effect of bacteria, you do not have much water left in the board.

Q. You got a sterile product for Kimberly-Clark,
1821 that they use for Kotex?

A. Yes.

Q. And that was creased and everything else, was it not?

A. Yes.

Q. After your employment by the Ex-Cell-O Corporation, to which you referred, was terminated, did you advise Dr. Herman Bundesen that you believed the research then reported did not establish that the use of paper containers for milk might safely be authorized by public health officials?

Mr. Schaefer: Will you read that question, please?

(Mr. Gariepy's last question was read by the reporter as above recorded.)

The Witness: A. I don't understand the question yet.

Mr. Gariepy: Q. After you took Exhibit No. 4, in December, 1937, in to Dr. Bundesen, did you, subsequent to that date and the date of making that report, advise him that single-service containers for milk might not be authorized safely by public health officials or by the city of Chicago?

A. Yes, I think I did.

Q. When?

A. I think that was May, the last of April or in May of that year.

Q. Was that a written report or verbal?

1822 A. I don't recall which it was. I know I told him about it and I may have written it.

Q. And when did this Sealrite employment start? This was in May that you advised Dr. Bundesen?

A. This was in June.

Q. June, the next month?

A. Yes.

Q. Then it is not a fact, as you testified yesterday, that your experience with Sealrite from June to December, 1938, gave you this experience and this information on which you based your opinion?

A. Yes, I think that is right. I did not know that the paper container was absorbent at the time I made this report to Mr. Scott. I thought it was only when the paraffin chipped off and there was a bare spot left, that the container was absorbent. It was not until subsequently, during March and April, that I investigated the paper containers and found all of them to show the same type of absorption.

Q. Then it was not your experience with Sealrite that caused you to give Dr. Bundesen that advice?

A. I gave him that advice before I was with Sealrite.

Q. That is in May, 1938?

A. Because of the absorption, yes.

Q. That is in May, 1938?

A. Yes.

1823 Q. The absorption element was the sole element on which you based your conclusion and your recommendation to him that the container could not be made safe for the delivery of milk, is that it?

A. The absorption was a disturbing factor to me, and I reported that to him as such.

Q. Besides being a disturbing factor, did it prevent the container from being safe for the use of fresh fluid milk?

A. I think so, yes.

Q. Did you ever measure the amount of the absorption, Doctor?

A. Why, I weighed some, but I have not measured it very accurately, no.

Q. You heard Dr. Prucha testify here that he measured the absorption and he found four drops in a quart, did you?

A. I heard him testify, yes.

Q. Do you believe he was honest in that testimony?

Mr. Schaefer: The witness had not finished his prior answer.

Mr. Gariepy: Hadn't you finished, Doctor? I want you to finish.

Mr. Schaefer: With respect to Dr. Prucha's testimony.

The Witness: A. Yes, that was the smallest
1824 amount he found.

Mr. Gariepy: Q. Did you hear him testify that he found any larger amount than four drops?

A. Yes.

Q. And how much larger amount did he say?

A. As I recall, up to four cc.

Q. How many drops is that?

A. Four times fifteen.

Q. Sixty drops?

A. Yes.

Q. And that presents a health problem?

A. Yes.

Q. If there is no bacteria in the paper board and there are four to sixty drops of absorption in the paper board, how does a health problem arise?

A. It is seldom that the board is sterile, and if the board is not sterile—

Q. Is a glass bottle sterile?

The Master: Let him finish his statement here. Go ahead, Doctor.

The Witness: A. (Continuing.) —and if the board contains bacteria, they will get into the milk, and then if the board is sterile, it contains plenty of dead bacteria that have been enmeshed in the fibres during the paper making process. Those dead bacteria can be dissolved into the milk.

Mr. Gariepy: Q. Are they spore forming?

1825 The Master: Q. Is there a health problem there?

A. I think there is, yes.

Q. Why?

A. According to the number of bacteria that are there. It is a type of vaccine. They are not growing bacteria, they are not living bacteria, but they are dead bodies of bacteria.

Mr. Gariepy: Q. How much bacteria is contained in a quart of milk, Doctor, dead bacteria?

The Master: That is a pretty general question, is it not?

Mr. Gariepy: Yes.

Q. How much, Doctor?

A. I don't know. I could not say that.

Q. And what is the purpose of pasteurization, if it is not to kill this dead bacteria further, make it more dormant?

A. That is what it is.

Q. That is what it is, Doctor?

A. Yes.

Q. Are they living bacteria or are they dead bacteria in a quart of milk, Doctor?

A. There are both.

Q. And pasteurization gets rid of them, doesn't it?

A. Gets rid of them. Not all of them.

Q. And you don't know how much bacteria there are in a quart of milk, do you?

1826 A. No.

Q. Now, if the paper board happens to be sterile, as you say it is at times, there wouldn't be any public health hazards or danger by reason of this absorption, as you say?

A. Yes, I think there would be.

Q. If the paper board is sterile and it takes in a few drops of milk, and there is nothing in the board that can contaminate the milk, where does the puublic health problem arise?

A. There will be a good many bodies of dead bacteria, which will be resin, which will be alum, which will be the sizing materials that are in the paper.

Q. Aren't there literally thousands of bacteria in milk after the pasteurization process? Do you know that?

A. Yes. There are 200—yes.

Q. And that is, pasteurized milk that has been approved, say, by the city of Chicago?

A. Yes.

Q. Is anybody injured by reason of drinking milk with that bacteria in it, after the pasteurization?

A. No. It is a different type of bacteria.

Q. What type of bacteria is it in this paper board that you say may be found from time to time, that is so harmful and presents this health problem, even when

1827 dead?

A. There are soil bacteria that are growing in the soil and form part of our biological cycle of nature by decomposition of the organic manner.

Q. What are the kind of bacteria in milk that are killed, Doctor, by pasteurization?

A. They usually come from the udder of the cow. They are a type of what we call milk bacteria, what the milk sanitation calls his milk flora.

Q. You don't call that soil bacteria?

A. They are not the same type of bacteria we find in paper.

Q. Is there any difference in their effect?

A. Yes.

Q. Explain elaborately, Doctor.

A. Those bacteria in the soil differ from those in the milk, in that the soil bacteria are primarily decomposing types of bacteria. Those present in the milk are primarily those that act on sugars. They are the milk souring group, primarily.

Q. When they are dead, Doctor, what difference does it make?

A. It is the protein content that makes the difference.

Q. Is there any acid in milk?

1828 A. There is no acid in fresh fluid milk just as it comes from the cow.

The Master: Q. What effect do these dead bodies of flora or cow bacteria have upon the milk?

A. Nothing. They are the fermenting types, usually, that sour the milk. The fermenting types, not the decomposing types that break down protein material.

Q. That is, the dead bodies have a souring effect on the milk?

A. No, sir. Only living ones.

Q. I am talking about the dead ones.

A. The dead ones are practically harmless, of that lactic acid souring group.

Q. They are what?

A. They are practically harmless.

Mr. Schaefer: You are talking about the bacteria in paper and the Doctor is talking about it in the milk.

The Master: No, I am talking about the bacteria that comes from the cow, that have been killed by the pasteurization process.

Q. You say that some of them are in the milk?

A. Yes.

Q. And I am asking what effect do those dead bodies of cow bacteria have upon the milk?

1829 A. I don't think they have any effect. They are present in buttermilk, naturally sour milk of all

kinds. These bacteria produce the acid from the sugar, and when the acid gets concentrated enough it kills them off.

Q. You say by pasteurization some of these cow bacteria are killed?

A. Yes.

Q. They remain in the milk?

A. Yes.

Q. Those are the dead bodies?

A. Yes.

Q. Do those dead bodies have any effect at all upon the milk?

A. I don't think they do, if they are in a reasonable number, but certainly a high bacterial count would have, and then to pasteurize the milk with a high bacterial count, well, it is not wholesome mik.

Q. Now, let us take a point further, Doctor. If those same dead bacteria are absorbed into the walls of the paper container and sort of flow back and forth between the inside of the wall and the milk, do those bacteria have any effect upon the milk, those dead bacteria?

A. You would not have the same type. It would not be the milk souring group.

Q. It is the same bacteria. You said the milk is 1830 absorbed to some extent?

A. Yes.

Q. You say the milk would be to a reasonable extent germ-free. Now, all that the milk would have would be dead bodies that came from the cow?

A. Yes.

Q. Now, if the walls of the paper container absorbs milk, they therefore absorb only the dead bacteria and such live bacteria as may still be in the milk?

A. Yes.

Q. What effect upon the milk do these dead bacteria or even these live bacteria have, when they go into the walls of the paper container and come back into the milk?

A. I think they will alter the milk.

Q. Any more than if they do not go into the walls of the paper container?

A. Yes.

Q. Why? That is what I am getting at.

A. If it goes into the wall of the paper container, you are adding something to the milk and you are adding a

variety of bacteria, whether living or dead, that is foreign to the milk.

Q. You mean you are going to bring into the milk bacteria that were not in the milk originally, but were in the walls of the container?

1831 A. Yes, sir.

Q. Dead bacteria or live bacteria?

A. Yes, sir.

Q. Have you any idea what the effect would be of those dead bacteria that were found originally in the walls of the paper container, rather than in the milk?

A. I would expect them to be more toxic. I would expect the proteins to be more foreign and they would be the more irritating of the bacteria, in the wall of the container, and there is a large number of them.

Q. That is, the dead bodies of those bacteria would be more harmful than the dead bodies of the bacteria which originally were in the milk?

A. I think they would, yes.

Q. Is there any reason for that?

A. Simply the matter of the complex protein and the matter of their being so foreign, so little experience with them, and there are so many of them. They are a protein decomposing group of bacteria and I think they would be much more toxic than the flora ordinarily present in milk.

Q. Even though dead?

A. Yes, sir.

Mr. Gariepy: Q. Doctor, do not the acid forming bacteria of milk restrain the growth of soil bacteria in the paper?

1832 A. No.

Q. Is there an acid forming bacteria in the milk?

A. Yes.

Q. Do you know what the United States Public Health Service standard is with regard to the number of bacteria allowed per quart?

A. I know it is 30,000 per cc.

Q. And that is permissible as milk that does not present any health problem?

A. Yes.

Mr. Schaefer: That is pasteurized milk?

The Witness: That is pasteurized milk, yes.

Mr. Gariepy: Q. And are those live ones or not?

A. Yes.

Q. They are live bacteria?

A. Yes.
Q. Thirty thousand?
A. Yes.
Q. Three hundred thousand per quart and thirty thousand per centimeter, that is right, is it not, Doctor?
A. Approximately that, yes, sir.
Q. I think the computation was in error. That would be three million per quart, wouldn't it, Doctor, rather than three hundred thousand?
A. Well, it is not quite a thousand, but we usually consider a thousand cc to the quart. It is not quite a thousand, but whatever the computation would come to.
1833 Q. What is the business of this Sealrite Corporation that you did work for from June, 1938, to December?
A. They manufacture paper containers for food and milk products.
Q. Did you ever approve of the paper container that they manufacture for food and milk products?
A. No, sir.
Q. What was your work for them?
A. My work was of a sanitary nature, starting with the raw material and going through the mill, and the conversion plant, increasing the sanitary safety, and instructing and outlining programs for personal hygiene of the employees.
Q. Did you have anything to do with the matter of the making of the paper board for caps and the technique employed in manufacturing those caps?
A. I have observed it there, yes.
Q. Is not the Sealrite Corporation the largest manufacturer of paper board caps for glass milk bottles in the world?
A. I could not say that.
Q. Did you ever inspect their making of paper board for milk bottle caps, at the Sealrite Corporation?
A. Oh, yes.
Q. Had you ever visited a paper mill manufacturing fibre board for paper milk bottles at any time before
1834 December 4, 1937, other than Kimberly-Clark mills, manufacturing these cellulose products that you testified about?
A. No, sir.
Q. You knew Dr. Breed and Dr. Sanborn, you testified

yesterday, the former twenty years and the latter three years?

A. Yes.

Q. Are they competent, efficient men in the research field with regard to paper products and bacteria?

A. Yes.

Q. Did you so consider them when you went there in November, 1937?

A. Yes, sir.

Q. To secure data with regard to making a report to Dr. Herman Bundesen?

A. Yes.

Q. Do you consider those men honest in their research work?

A. Yes.

Q. You included your summaries of their reports of research work in Plaintiff's Exhibit No. 4 here that you handed in?

A. Yes.

Q. Had you any reason to suspect that their figures, concerning the bacteria count on the paper board, that you asked them to get from the Cherry River Paper
1835 Company at the time you went there, were in any way doctored up or falsified?

A. No.

Q. You also know Dr. Martin Prucha, who testified here?

A. Yes.

Q. How long have you known him?

A. I suppose close to ten years.

Q. Do you consider him an honest, capable bacteriologist, and an experienced one?

A. Yes.

Q. Have you any reason to suspect that the experiments he performed upon paper board for two years and testing paper machines and the bacteria count on paper board are in any way untrue or false?

A. His proctocals are not. His experiments, I think, are sound.

Q. What about the results of his experiments; do you consider them false or true?

A. You mean by results, interpretation?

Q. The findings that he reported at various times with regard to testing paper board, concerning stability, absorption and sanitary qualities.

A. The results of his test in the form of written reports and material are sound, and, I think correct.

1836 Q. You included those in your report of December 4th, Plaintiff's Exhibit 4, that you handed in to the Board of Health?

A. Yes.

Q. Have you had any experience that causes you to doubt that Dr. Prucha's experiments and research in the field of paper board are in any way unsound or untrue since that time?

A. His experiments are not, no.

The Master: Q. What is it, then?

A. I disagree with his interpretation of some of his experiments, Master.

Mr. Gariepy: Q. Which one of his experiments that he performed at the University of Illinois over a period of two years and six months do you disagree with?

The Master: He didn't say.

The Witness: A. I don't disagree with his experiments at all, but I place a different interpretation on them. I would evaluate them differently.

Mr. Gariepy: Q. They are not worth anything, is that it?

A. Oh, yes, they are worth a whole lot.

Q. I see.

A. But every experimenter can draw his own

1837 conclusions from the experimental data that have been presented. That is the reason we present our experimental data in such detail. The author can draw his own conclusions, while somebody else can draw their own conclusions from the same data.

Q. Then his conclusions that he has drawn from his research work are not true, or not accurate?

A. No, I would not say that, no.

Q. I see.

A. I would simply differ with some of them in some respects, but that we know. I have discussed that with him.

Q. Tell me which one of the conclusions that Dr. Prucha has drawn from his experiments and research work on the single-service container and the paper board you disagree with?

A. Self-sterilization of paper is one of them.

Q. What else?

A. The matter of the dryer sterilizing the paper.
Q. What else? That is two.
A. The bactericidal effect of paraffin.
Q. What?
A. The bactericidal effect of melted paraffin or hot paraffin.
The Master: Q. Anything else?
A. I can't think of anything else right offhand.
1838 Mr. Gariepy: Q. Did you perform any tests on the bactericidal effect of paraffin?
A. Yes, I have performed a few.
Q. When?
A. In the spring of 1938.
Q. Did you report those to the Board of Health?
A. Yes.
Q. Did you ever send Fieldcrest Dairies, who had an application pending then for the use of Pure-Pak containers involving the use of paraffin, the results of your report?
A. No, I did not.
The Master: Suppose we have a five minute recess here.
(A short recess was here had, after which the proceedings were resumed as follows:)
Mr. Gariepy: Q. How long have you known Dr. Paul Tracy, who testified here, and who is with the University of Illinois Husbandry Department?
A. About four or five years, I think.
Q. Do you know of any of his research work and writings and scientific articles?
A. Yes.
Q. With special reference to the single-service container?
A. Yes.
1839 Q. Do you consider him competent and efficient in his field of endeavor and work?
A. Yes.
Q. Did you so consider his research work and did you consider it reliable when you made up this report in December, 1937, and included part of his reports and writings and findings herein?
A. Yes, sir.
Q. Is it not a fact that bacteriologists in doing research work perform a very large number of tests before they draw their conclusions?

A. Yes.

Q. And do you consider the tests that you performed in the year 1938 more reliable and more responsible than the tests performed by Dr. Prucha and Dr. Tracy in the years 1937 and 1938 and up until 1939 here?

A. Not any more reliable, but I think just as reliable.

Q. When did you do this research work of yours, what year?

A. I did it in 19—you are referring to the paraffin?

Q. I am referring to the Pure-Pak container, the sterility of the board and the sanitary aspects of the board.

1840 A. I don't think it was on Pure-Pak. I don't know what container it was on.

Q. When did you do it, Doctor?

A. As I said before, in March and April of 1938.

Q. And how much time in March and April of 1938, did you expend or put forth on that work?

A. I would say probably not more than 25 or 30 tests carried out, not more than that.

Q. And do you consider those as accurate and as sound as the number of tests that Dr. Prucha and Dr. Tracy have conducted on this subject?

A. I considered them sound, yes.

Q. Are they as sound and as reliable as compared to the number Dr. Tracy and Dr. Prucha report here?

A. The number, no, but the number is a secondary factor.

Q. Then the point concerning the bacteriologists performing a large number of tests is not significant; you can find the same result on one or two or three tests, and that would be just as reliable, is that it?

A. No. No, that does not follow.

Q. Now, how long have you known Dr. Vaughn, who is the Commissioner of Health of Detroit?

A. Oh, I have known Dr. Vaughn for twenty or

1841 twenty-five years.

Q. And do you consider him an efficient milk sanitarian and public health expert?

A. Well, he is a public health administrator. I would not call him a milk sanitarian.

Q. Do you consider him a public health expert who is efficient and competent?

A. Yes.

Q. And did you so consider him in the months of November and December, 1937?

A. Yes, I did.

Q. Do you know Mr. Palmer of the Detroit Board of Health?

A. I met him when I was there. I did not meet him before.

Q. You never knew him before?

A. No, sir.

Q. Does he hold the same position with the Detroit Board of Health that Paul F. Kruger, who testified here, does with the Chicago Board of Health?

A. A comparable position, yes.

Q. And did you discuss with him there a matter with regard to the sanitary aspects of single-service containers of the city of Detroit, from their experience and use?

A. Yes.

Q. Was anybody present at the time that you held
1842 that conference with Mr. Palmer, securing that information for this report?

A. Yes, sir.

Q. Who?

A. Dr. Vaughn, Dr. Meader, who is in charge of the bacteriological laboratories in the Detroit Board of Health, myself and Mr. Scott.

Q. Was Mr. Hoffman, sitting here, present at the time when you were talking to Mr. Palmer of Detroit?

A. There was a second man besides Mr. Scott. There was a man accompanying Mr. Scott. Who, I don't recall.

Q. How many hours or minutes would you say you were in conference with Mr. Palmer with regard to the Detroit condition, securing information from him for this report?

Mr. Schaefer: I object to that.

Mr. Gariepy: Q. Do you know how much time you put in in checking with Mr. Palmer concerning the Detroit situation on the use of the paper container which you referred to in this report?

The Master: I will let him answer.

The Witness: A. It was during the afternoon. I don't recall. It might have been an hour. It might have been two hours. I don't recall.

Mr. Gariepy: Q. Do you consider Dr. Meader a competent, honest, reliable bacteriologist?

1843 Mr. Schaefer: That is objected to.

Mr. Gariepy: Did you so consider—

Mr. Schaefer: Just a minute. If the Master please,

that is objected to. We have gone pretty far afield here and I have not objected to Dr. Arnold's opinions as to the competency and reliability of witnesses who have testified here. Now, we are going beyond that field and we are going into the realm of Dr. Arnold's opinion with respect to—well, there have been three or four people mentioned so far, and I apprehend there will be more. What he thinks of those men and their work is of no consequence in this lawsuit.

The Master: I will let him answer with respect to this one, and you can renew the objection when others come on.

Mr. Gariepy: Read the question.

(The record was read as above recorded.)

Mr. Gariepy: Q. Did you so consider him in 1937, in the months of November and December, when you consulted with him on this subject?

A. Yes, sir.

Q. Do you know how many single-service containers for fresh fluid milk are being used daily or monthly in 1844 in the United States, and with the consent of health officers, in cities?

A. No, sir.

Q. What investigation, if any, have you made to ascertain that amount?

Mr. Schaefer: Now, if the Master please—

Mr. Gariepy: Wait a minute, Mr. Schaefer. You put this man on as an expert witness here. I did not object to what was said yesterday, for three hours.

The Master: Let him make his objection.

Mr. Gariepy: All right. Excuse me, Master.

Mr. Schaefer: I object to the question, on the ground that we are extending the realm of permissive use of paper containers. I objected to the evidence originally and the Master let it in subject to my objection. Now, we are going into whether an investigation of that use was made. The use itself, I am strongly convinced, is immaterial in this lawsuit.

The Master: The question is what investigation, if any, the witness made to ascertain the amount of single-service containers.

Mr. Gariepy: The amount in use.

The Master: In other cities.

Mr. Gariepy: Of single-service containers.

1845 The Master: In other cities.

Mr. Gariepy: That is right.

The Master: I will let him answer the question.

The Witness: A. I have not made any investigation.

Mr. Gariepy. Q. Has anybody on the Board of Health of the city of Chicago made any investigation or check-up, that you know of?

A. I do not know.

Q. Do you know of any instances where disease or epidemics can be traced to the use of the single-service milk bottle in any city?

A. No. I answered that once before.

Q. No, I asked you about children once before, Doctor.

A. About what?

Q. About children before, babies. I will withdraw it, if I did.

A. Yes, that is the second time that question was asked.

Q. I am sorry if I embarrassed you.

The Master: Well, it has been answered the same way both times, so it is all right.

Mr. Gariepy: Q. Doctor, now let us get back to this matter of the use of the glass milk bottle. When does the real danger in the use of the glass milk bottle, with regard to diseases, in quarantined places, really exist?

1846 A. When?

Q. When. Is it after the quarantine or does the public health hazard exist before the thing is quarantined and before you stop it?

A. I don't understand what you mean by your question, before the quarantine.

Q. Well, let me try to put it a little clearer. In a case where there was quarantine by reason of communicable disease and you trace it back to a glass milk bottle, when has that danger and how long has that danger with regard to that glass milk bottle been existing previous to the time you put on the quarantine?

Mr. Schaefer: Will you read that, Mr. Golding?

(Record read as above recorded.)

The Master: Is there an assumption there that disease was caused by the glass milk bottle?

Mr. Pariepy: Q. Let us assume that it has been caused by the glass milk bottle, Doctor, or traced to it.

Mr. Schaefer: Then what is the pending question.

Mr. Gariepy: Then the pending question, Mr. Schaefer, is how long has that danger been prevalent, been existing,

before they quarantined the place and prevented a further use of that same bottle, without this extra steriliza-
1847 tion?

Q. How many days is that, Doctor, usually?

The Master: The only testimony here is, as I recall it, is that after a place has been quarantined—

Mr. Gariepy: That is right.

The Master: (Continuing)—then they do not permit them to use glass milk bottles. But I do not recall any testimony here that any glass milk bottles were the cause of the disease in the first instance.

Mr. Gariepy: Q. Have you ever been able at any time and in your experience, Doctor, in public health or in bacteriology, to have occasion to trace any disease to a glass milk bottle?

A. No.

Q. Have you ever heard of diseases or epidemics, where there was occasion for quarantine, being traced to a glass milk bottle as the carrier of it?

A. I think there are such instances on record.

Q. Before the quarantine goes on at the place where the bottle was used, how long usually is it that the danger from contamination concerning the use of that bottle has existed, in hours, days or weeks?

A. It depends upon the incubation period of the disease.

1848 Q. Don't they usually quarantine after they have found the bottle and traced it as having come from that place three or four days?

A. I don't understand where the bottle comes in.

Q. The bottle has been going to the house where the disease is, Doctor.

A. During the incubation period?

Q. Yes.

A. You cannot make a diagnosis. How can you quarantine? We quarantine as soon as we make a diagnosis.

Q. And in the meantime the bottle has been going there and the bottle has had this contamination to spread the disease?

A. Yes.

Q. That is right?

A. It cannot be helped.

Q. That is right?

The Master: Q. You say there are instances of records where the bottles have been the source of the diseases?

A. By elimination only, not by proof. That was the only thing that fitted into the epidemical picture. There was no proof.

Q. In what instances would you say the bottle might be the disease source?

A. In case the bottle was the only outside con-
1849 veyor that came into the home, that could have brought in the disease.

Q. Would you say it would be the bottle or the milk in the bottle, or what?

A. Both. Of course, a bottle cannot carry it, because the contents grow the organisms. If a bottle was contaminated and filled with milk, the contamination grows in the milk.

Mr. Gariepy: Q. Then, Doctor, there is a time when the bottles remain in circulation before the disease has been diagnosed, is there not?

A. Yes, sir.

Q. At the time that you went to see Dr. Breed and Dr. Sanborn in November, 1937, you were thoroughly familiar, from your ten years' consultant work with Kimberly-Clark, with the bacteriology of cellulose products, were you not?

A. Yes, sir.

Q. Had you taken bacterial counts on pulp for Kimberly-Clark?

A. Yes.

Q. At that time did you acquire your information about the behavior of bacteria in cellulose substances, such as Kleenex and Kotex?

A. Yes.

1850 Q. The fibre board used in manufacturing paper containers is also a cellulose product, is it not?

A. Yes.

Q. From a bacteriological standpoint and in making your tests for the number of bacteria, is there any distinction between the behavior of bacteria in a cellulose product such as Kleenex and a cellulose product such as fibre board?

A. There is some difference, but in principle it is the same.

Q. What is that difference, if the principle is the same?

A. Both of them are cellulose fibres. One of them is

a purified cellulose fibre, without any foreign matter of any kind added.

The Master: Q. What one is that?

A. That is the Kimberly-Clark tissue product. That is pure cellulose. Now, the paper board is not purified, even the sulphide pulp is not purified to the extent that the tissue products of Kimberly-Clark are purified. In addition to that, there is resin and various sizings added to it, which alters it in detail, but it is still physically cellulose products.

Q. So far as the fibres are concerned, they act about the same, do they?

A. In principle the same.

1851 Q. Now, you are referring to bacterial action?

A. Yes.

Q. What method of disintegrating the pulp for manufacturing the raw pulp did Sealrite use, if you know?

A. They used the Sanborn method.

Q. Is that a reliable method?

A. Yes.

Q. Is that mechanical or is that a chemical method?

A. That is a disintegration method.

Q. Is that a mechanical method?

A. Yes.

Q. It is mechanical?

A. Yes.

Q. Doctor, what method of disintegrating this raw pulp or manufacturing this raw pulp did Sealrite use?

A. They use mechanical and chemical both.

Q. Both?

A. Yes.

Q. You have referred frequently in your testimony to the capillary action or attraction caused by tubular forms of cells. Where did you have your experience or make your tests from which you reached the conclusion that the tubular structure of the cells cause this capillary action?

A. That is in botany.

Q. In botany?

A. Yes.

Q. When?

A. I had botany with Professor Goebel at Munich.

1852 Q. When was that, Doctor?

A. 1913, 1912 and 1913.

Q. And you were perfectly familiar with that same

action in December, 1937, when you prepared this report, Exhibit No. 4?

A. Yes, sir.

Q. You do not mention it in there, do you?

A. No.

Q. As the result of your studies for Kimberly-Clark, you were undoubtedly familiar, were you not, with the behavior of bacteria and tests for bacteria in these cellulose products?

A. Yes.

Q. You testified that clusters of bacteria were drawn by capillary action into the tubular cells and that for that reason the disintegration test was inaccurate?

A. Yes.

Q. The reason for this inaccuracy, you claim, is that instead of each colony which develops representing one bacteria, it might represent X number of bacteria, is that correct?

A. Yes.

Q. To some extent this is also true of the rinse test in glass bottles, is it not?

1853 A. I don't think so. If you shake well, I think you get a uniform distribution.

Q. The shaking well is done approximately how many times?

A. I think about twenty times, fifteen or twenty times.

Q. Fifteen or twenty times?

A. Yes.

Q. And the purpose and method of this hand shaking —that is what it is, is it not?

A. Yes.

Q. (Continuing.) —is to do what?

A. Is to rinse off the sides and suspend the material uniformly in the rinse water.

Q. Is it not to dislodge the bacteria?

A. It is to rinse them off the sides, yes.

Q. That is a physical process and not a chemical, is it not?

A. A physical, yes.

Q. That rinse test?

A. Yes.

Q. And that is the test you use on glass milk bottles?

A. Yes.

Q. Is it not a fact that in performing the rinse test

on a glass bottle the clusters or clumps of bacteria are never completely broken up, so that the colony of bacteria which is counted on performing the rinse test of the glass bottle may represent more than one bacteria
1854 or an unknown quantity, which you refer to as X?

A. It might. The possibility is there.

Q. And that might apply also in the paper bottle?

A. Yes.

Q. Then the test concerning the rinse test on heat in regard to the accuracy and the X number of bacteria is the same?

A. Yes.

Q. Is the capillary attraction of the tubular cells you testified to a physical or chemical process?

A. It is probably more physical.

Q. In breaking up the clusters of bacteria in the tubular cells you have a physical problem and not a chemical?

A. I think it is more physical than chemical, but I do believe there is some chemical.

Q. If this tubular cell itself is broken by the physical treatment in here, of any type, that will scatter the clusters of bacteria that you refer to, is that right?

A. No.

Q. Then they are all together?

A. Yes, sir.

Q. In this one colony of bacteria containing X
1855 number?

A. You mean the fibre is there?

Q. Yes.

A. And the bacteria adhere to the fibre.

Q. And there is an X number then?

A. Yes, on the fibre.

Q. Then it is not the tubular shape that causes it, is it?

A. No, I don't think—that is the reason it is not all physical. Those that are tubular shaped will have more bacteria on them than the disintegrated fibres. The disintegrated fibres still have bacteria adhering to them.

Q. How will you go about breaking up the tubular cell structure as to be able to count the actual number of bacteria in a given number of cells?

A. I spent a lot of time trying to do that, and I have not succeeded.

Q. Do they do it by the rinse test in any way, that you know of?

A. You haven't cellulose fibres in the rinse test.

Q. You are sure about that, are you?
A. I don't think you have. I don't know where they come from.
Q. Unless the tubular form of cell was present on the paper to which you are applying the disintegra-
1856 tion test, your criticism would not apply, would it?
A. No.
Q. Do all forms of paper have the tubular forms of cells?
A. Yes.
Q. Did the paper you tested for the Sealrite Corporation and upon which you changed opinions in May, 1938, show the tubular fibre to which you testified?
A. Yes.
Q. Was that paper used for milk containers?
A. I think it was.
Q. You are not sure about it?
A. There were so many samples tested. I know there were some milk container samples in the test lots.
Q. Have you made any independent tests of fibre board or cellulose products, other than the Kimberly-Clark and for the Sealrite Corporation?
A. Yes.
Q. For whom?
A. A disintegrated container, unparaffined container.
Q. For whom did you perform those tests?
A. For my own information. They were sent to me by American Can and by Ex-Cell-O.
Q. When was that?
A. That was early in 1938.
Q. When did Ex-Cell-O send you some early in 1938?
1857 A. They sent some to my home address, a box of—it was either six or twelve—unparaffined containers.
Q. From Detroit?
A. From Detroit, yes.
Q. Did you ever report to them the result of those tests?
A. No, I never did. Part of them are still at home, in my library.
Q. Explain what you mean by pulp which is manufactured by the chemical instead of by the mechanical process, to the Master.

A. The chemical process is a cooking process, where the lignin and resins are dissolved out of the cellulose fibres. It is a chemical extraction method for the purpose of purification.

The Master: Q. What about the mechanical?

A. The mechanical method is such that the logs, instead of being put in large cookers under pressure and steam and heat and alkali, as in the sulphide or cooker method of extraction, in the mechanical method there are grinders, and those grinders are regular carborundum stones. The logs are put in the grinder and pressed with severe atmospheric pressure, against those rotating carborundum stones, and it grinds off the pulp. It comes out a bluish yellow creamy mass, right out of the grinder, and
1858 then is washed several times and is used as mechanical pulp. It is disintegrated mechanically and then it is disintegrated chemically.

Mr. Gariepy: Q. The chemical process breaks the fibres down, doesn't it?

A. Not always. No, it does not break them down. That is, it is hoped they won't be broken down. If they are over-cooked, they will break down, but it is the purpose of the paper chemist to merely extract, and he wants to extract from the wood, leaving the fibres as long as he can, and as nearly intact as he can, so as to give stability and strength to the paper.

Q. When the chemical process is carried on and finished does not the material result in a flaky material?

A. Yes.

Q. And when the mechanical process is ended, isn't that a sort of a beady type of material?

A. No, sir.

Q. Is there any difference in the type of material when it gets through the two processes?

A. There is a little difference in the color, but there is very little difference between the two pulps as
1859 you see them.

Q. At what temperature is this cooking process that you refer to carried on, if you know, in the paper board mill, and at what temperature?

A. It is a high temperature, but I could not give you the temperature of the vats.

Q. And what is the acid or the liquid put in there?

A. They first use alkali and then neutralize it with acid.

Q. What acid?

A. Sulphuric.

Q. Would you say that this pulp, after it had gone through the chemical cooking process, is shapeless, or does it have shape?

A. Oh, yes, it has shape.

Q. Would you say that this material is not flaky and that the fibres are subject to capillary action, is that so?

A. Yes, sir.

Q. Did I understand you to say it was flaky or not flaky, Doctor?

A. I don't know just what you mean by flaky.

Q. You know what a snow flake is; you know what soap flakes are?

A. Oh, no, it is not like that.

Q. It is not?

A. Oh, no.

1860 Q. What is it?

A. It is fibrous. It is pulp. That is all. Pulp is pulp.

Q. Would fibre board made from a chemical formed pulp be more easily disintegrated for bacterial tests than wood made from a mechanical pulp?

Mr. Schaefer: You mean paper?

Mr. Gariepy: Paper board.

A. I don't know that there would be any difference. I have not observed any difference.

Q. Have you ever attempted to ascertain by experiments whether there is any difference?

A. Well, I have disintegrated both and I did not observe any difference.

Q. When did you do that?

A. It was done at Sealrite, when I was there. It was done in the laboratory that was put in there.

Q. They had the mechanical process at Sealrite?

A. They had both the mechanical and chemical.

Q. And you tried both of them, did you?

A. Yes.

Q. Why did you make the test, Doctor? Did you make it to ascertain whether it was free from bacteria or not?

1861 A. I made the test from the first raw material to the finished product, step by step.

Q. Why?

A. To ascertain, as best we could, the sanitary qualities of each step.

Q. The amount of the bacteria?

A. Yes.

Q. Did you in those tests determine the relative amount of bacteria in each, one made by the chemical and the other by the mechanical process?

A. Not that I know of.

Q. Those are reliable tests, those disintegration tests, are they?

A. They are the only tests available. I don't think they are reliable.

Q. Do you know of any more accurate tests?

A. I do not.

Q. Has the Health Department of the City of Chicago made any disintegration tests on Cherry River Paper Company board?

A. Not that I know of.

Q. Did you ever make any on Cherry River Paper Company board?

A. Not to my knowledge.

Q. Have you ever seen the Cherry River Paper Company mill in Virginia?

A. No, sir, I have not.

Q. You are not acquainted with any of the sanitary methods, then, that are employed there?

A. Except what I heard testified to by Dr. Sanborn.

1862 Q. You believe that testimony that you heard?

A. Yes.

Q. Have you ever visited the Gardner-Richardson fabricating plant?

A. No, sir.

Q. Did you hear the testimony concerning the sanitary methods there employed, with regard to the hospital, and sanitation for the employees and the storage of the paper and keeping the paper?

A. Yes.

Q. You were present at the time those exhibits went in showing the keeping of large blocks of paper and putting them on cars for shipping and so on?

A. Yes.

Q. You heard Mr. Fisher testify concerning the warehouse and the care taken in the storage of the paper, didn't you?

A. I heard him testify.

Q. Do you consider those sanitary methods for the prevention of contamination?

A. What he testified to, yes.

Q. Have you any reason to believe that those methods are not employed?

Mr. Schaefer: That is objected to.

The Master: Sustained.

Mr. Gariepy: Q. Did you see the results on No-
1863 vember 16, 1937, of the Breed-Sanborn tests of the Cherry River board?

A. I don't recall the date. I saw some tests, yes.

Q. When you were at Geneva to see Dr. Breed and Dr. Sanborn?

A. Yes.

Q. Did they make any additional tests at your request?

A. Yes, sir.

Q. Were you satisfied with the result of those tests?

A. Yes.

Q. Did you know at that time the method or technique employed in performing those tests?

A. Yes.

Q. The results of those tests were satisfactory to you, were they not?

A. The results of the tests showed an improvement.

Q. Were they satisfactory to you or not?

A. They were not sterile. Therefore, it was not satisfactory. I thought I could make them sterile.

Q. Did you report anything in Plaintiff's Exhibit 4 to Dr. Bundesen, after you had been there and had these tests made and checked, concerning the fact they were unsatisfactory to you?

A. Except the first paragraph, in which I said that cardboard of a satisfactory sanitary quality can be obtained and used for this purpose. I was thinking of steriliz-
1864 ing the product, which I thought I could do at that time.

Q. Have you done it since?

A. No, sir, I have not.

Q. You were satisfied with the methods that they employed at that time, were you not?

A. That is the only method available.

Q. Why have you changed your mind now with regard to the method being improved on?

A. Why, just from knowledge that I have always possessed. I don't know of any way of improving on it. I don't think the product is perfect.

Q. Doctor, having your knowledge which you acquired from the Kimberly-Clark consulting work and by which you gained your familiarity with cellulose products and knowing the methods used in performing the tests, you were satisfied that those tests proved your statement in Plaintiff's Exhibit 4 that a sterile board could be obtained, weren't you?

A. Yes, sir.

Q. Is it not a fact that you were not referring to the future in this statement, Plaintiff's Exhibit 4, referring to this cardboard, but you were referring to the time that the report was made, and that you were then satisfied that the Cherry River Paper Company board was essentially sterile?

1865 Mr. Schaefer: I didn't get that.

Mr. Gariepy: Read it.

(Record read by reporter as above recorded.)

The Witness: A. No, there were several specimens of the Cherry River board that were sterile. I thought it was possible to make it all sterile. There were low counts—where there was a bacterial count made, they were very low.

Q. Will you explain this phrase from page 4 of your report of December, 1937, Plaintiff's Exhibit 4, reading from the first line: "Cardboard of a satisfactory sanitary quality can be obtained and used for this purpose." What did you mean then, Doctor?

A. I meant that there was some of the board sterile, that is, sanitary, and I thought that was safe. The other counts were very low and I thought they could be made sterile, inasmuch as there were some of the counts that showed sterility.

Q. You were referring to the present time, then, that is, December, 1937?

A. Yes, sir.

Q. Doctor, do you require absolute sterility of a glass milk bottle?

A. No, sir.

Q. Why do you want to require it of paper milk bottles?

A. I don't know where the bacteria comes from,
1866 and I don't know whether they come from the cover or come from the employees. I don't know where they come from.

The Master: Q. In the case of the paper?

A. In the case of the paper. It is without the jurisdiction of the health officers.

Mr. Gariepy: Q. Do you know where they come from in the glass bottle at all times?

A. They are under our inspection, under our jurisdiction.

Q. The city dumps and the places where they gather up the bottles, are those under your inspection?

A. The glass bottles are washed properly, no matter where they come from.

Q. Do you inspect the Milk Bottle Exchange washing?

A. No.

Q. Or any of the processes employed there in picking up and washing and returning bottles?

A. No.

Q. You testified that this absorption item in the paper board presented a health problem, is that right, Doctor?

A. Yes, sir.

Q. If you thought that a health problem was in-
1867 volved, due to the absorption in the use of paper containers, why did you not test the milk from such containers?

A. I did not think it was necessary to test the milk from such containers.

Q. That was your theory?

A. Yes.

Q. That it was not necessary?

A. Yes.

Q. Then the use of paper containers is not objectionable from a public health standpoint, unless the milk therein is contaminated by the container, is that right?

A. Read that question.

(Mr. Gariepy's question was read by the reporter as above recorded.)

A. Yes.

Q. And if you do not test the milk, then you cannot tell whether the container is giving you any contamination?

A. Yes, I think so.

Q. How are you going to tell whether it is giving you contamination if you have not tested the thing that the public is going to drink?

A. There is no use of testing the entire product, if it

is put into a porous container. You have got to control the sanitary quality of the container.

1868 Q. But if you do not know what the porous container gives into the milk, how are you to be able to say that the milk is poisonous or deleterious to health, that is in the container?

A. Because there are thousands of conditions and you cannot test but one, and the paper containers are not uniform.

Q. Are not they more uniform than glass bottles?

A. No, I don't think so.

Q. Are not their counts more uniform?

A. I don't think so.

Q. Have you checked upon the counts?

A. You mean the disintegration?

Q. Right.

A. The disintegration or rinse test?

Q. Both tests.

A. No, I don't think so.

Q. What counts do you know of in the past two years on the paper board as compared with the counts on the glass milk bottle that show a lack of uniformity?

The Master: What counts?

Mr. Gariepy: In the paper container. He says that the paper container is not uniform, that the counts are not uniform, and therefore they cannot do anything about it.

The Master: What does that have to do with milk

1869 containers?

Mr. Gariepy: He talks about the fact that the glass is standard.

The Master: He is talking about these dead bodies of bacteria in the wall of the paper container and he is not talking about any dead bodies in the wall of the glass bottle. I think he explained that before.

Is that right, Doctor?

The Witness: Yes, sir.

Mr. Gariepy: Q. Have you ever found pathogenic bacteria in paper board used in paper milk bottles?

A. No.

Q. I am referring to those that are harmful.

The Master: Pathogenic?

Mr. Gariepy: Yes.

The Witness: A. They are harmful. The two are the same thing.

Mr. Gariepy: Q. You would not have submitted this report, Plaintiff's Exhibit 4, to Dr. Bundesen of the Board of Health, if you thought that paper milk containers presented a public health hazard, would you?

A. No, sir.

1870 Q. You never saw Mr. George D. Scott, about whom Mr. Schaefer asked you yesterday, until he was referred to you by Mr. Paul Krueger of the dairy division, is that right?

A. Yes, sir.

Q. In November, 1937?

A. Yes, sir.

Q. You did not think he was asking of you anything improper by seeking to have you do this research work and present a report to the Board of Health, did you?

A. No, sir.

Q. You would not, simply because of the fact you were receiving a fee of $250 a month or a fee of so much per month over a period of four months, plus your expenses, have in any way falsified this report to the Board of Health, would you?

A. No, sir.

Q. When you prepared Plaintiff's Exhibit 4, you honestly believed that the information you were submitting was responsible evidence of the matters therein discussed, didn't you?

A. Yes, sir.

Q. And do you so believe now?

A. No, I do not now.

Q. What reason have you to distrust any of the

1871 information which you submitted in this report?

A. I think the information is sound, but it does not go far enough. There are factors I did not know anything about that are operating that should be included in considering the sanitary standards of the paper container.

The Master: Q. What was the date of that report, Doctor?

A. December, 1937.

Mr. Gariepy: December 4, 1937.

The Master: Q. When did you find those other factors?

A. 1938, the middle of the year, around April, May, June and July, along in there, maybe May, June and July, but right in the middle of the year.

Mr. Gariepy: Q. You testified on direct examination

that this was merely a preliminary report. What further work did you do in May, June or July of the following year and what did you contemplate when you handed in this report? Let us take first one, Doctor. You said this was a preliminary report?

A. Yes.

Q. What further work did you contemplate after you handed in this report?

A. I wanted to know what further work Mr. Scott
1872 wanted to do, what was being planned to do, whether to investigate some angles of it further, or not.

Q. What did you plan to do when you were going to investigate this over a period of four months and then you handed in this report in one month?

A. The one thing I wanted to investigate was the containers after they were filled with milk, as to their durability, particularly the leakage, the number of accidents that might occur in the handling, doing mainly an efficiency engineering study, from an unbiased source, and I thought that from the standpoint of paraffin, the temperature of paraffin to be used, that should be looked into. There were several points not discussed in great detail, as there was no further desire for my services after this report was rendered. There was nothing more said and I didn't say any more myself.

Q. Didn't you in this report submit data concerning the durability of paper containers?

A. By mechanical means, not by ordinary handling procedures.

Q. Are not these mechanical means more severe than the ordinary handling of a bottle by a housewife or in the store?

1873 A. Possibly not, no. They are not hitting on sharp corners. They are not hitting on the corners of steps. They are not subjected to the same type of ordinary dairy practice handling that a container might be subjected to.

Q. In other words, these tests shown in this report, which were made at the University of Detroit, with regard to 400 pounds upon a container, were not reliable, in your opinion, with regard to ordinary handling as between the housewife, in the store and in the ice box and on the table, is that right?

A. I think they were reliable, but I don't think they extended far enough in a good many ways. There are no

sharp points against it. There are many things that could happen to the container.

The Master: Q. What is the effect of a sharp corner?

A. Penetrating the paper and making leakage.

Mr. Gariepy: Q. Do you know of any instance, Doctor, where with ordinary handling the single-service milk container ran into sharp points and caused leakage?

A. No.

The Master: Q. Is there anything short of leakage that a sharp point might do?

A. I don't know, Master. I should think it could
1874 partly puncture, it might fracture, it might scrape into it. I don't know. It was those things I wanted to find out.

Q. Let me suggest something to you. What if you happen to hit the corner so that some of the paraffin might be chipped off.

A. Yes, sir, that is a possibility.

Mr. Gariepy: Q. Is there any leakage in the glass milk bottle or leakage problem?

A. Problem, you say?

Q. Yes.

A. Yes.

Q. And that existed in December, 1937?

A. Yes.

Q. And you so advised Mr. George Scott, by letter, that there was a leakage problem in the glass?

A. Yes, sure there is, yes, sir.

Q. Does that leakage problem in the glass present any different problem than leakage you say might exist in the paper container, from a public health standpoint?

A. I don't hardly think so. I was just interested in ascertaining how frequently it occurred and whether it did occur or not.

Q. Have you now detailed to the Master all the work that you contemplated doing after you filed this preliminary report in December, 1937, on this single-service con-
1875 tainer problem?

A. I don't recall what was contemplated at this time. It was rather hazy. We were going to work together and get what information we could.

The Master: Q. Let us put it this way, then: What other work have you done or what other information have you obtained since you submitted that report?

A. I have obtained considerable information, Master.

Q. Have you detailed that in your direct testimony?

A. Yes, sir.

Mr. Gariepy: Q. Did Mr. Scott at any time make any suggestions to you with regard to preparing this report and embodying your conclusions therein, which would mean that you put something in the report that you did not honestly believe?

A. No, sir.

Q. This $250 fee and expenses that you testified on direct you received, covered the first month's work, is that right?

A. Yes.

Q. After you discussed the report with Dr. Bundesen, why did you do nothing further, to complete what you describe as further work on this report?

A. There was no request for me to continue.

1876 Q. Did you write any letter to Mr. Scott or Mr. Dean with regard to continuing any further work?

A. I don't recall that I did. I don't think I did.

Q. Did you write them any letter with regard to the Ex-Cell-O machine being set up and being supervised by the Board of Health here in the city of Chicago?

A. Mr. Dean saw me.

Q. Did you write any such letter concerning that, Doctor?

Mr. Schaefer: Who?

Mr. Gariepy: Q. You, Doctor.

Mr. Schaefer: Write to whom?

Mr. Gariepy: Write to Mr. George Scott.

Mr. Schaefer: Who?

Mr. Gariepy: Mr. George Scott. Mr. Schaefer, let me continue, please.

Q. Did you write a letter at any time in the month of December, 1937, after you handed this report to Dr. Bundesen concerning the Board of Health of the city of Chicago supervising the installation of this machine?

A. No.

1877 Mr. Gariepy: Mr. Reporter, will you mark this Plaintiff's Exhibit 83?

(The document referred to was thereupon marked by the reporter Plaintiff's Exhibit 83 for identification.)

Mr. Gariepy: Q. Will you look at that letter, dated

December 17, 1937, on University of Illinois stationery, and tell me whether it is signed by you?

A. Yes, sir.

Q. Did you write that letter on that date?

A. Yes, sir.

Q. Did you not say something in that letter concerning the supervising by the Board of the installation of the Pure-Pak machine?

A. No, sir.

Q. After you had this conference with Dr. Bundesen *on or about December 8, 1937, did you write Mr. Scott* regarding the result of the conference, as it relates to this report?

A. I think I did, yes, sir.

Q. When you were discussing this report with Dr. Bundesen, did he criticize you severely for having undertaken this work first without consulting him?

1878 A. I don't recall him doing that, no, sir.

Mr. Gariepy: Mr. Reporter, will you mark this Exhibit No. 84?

(The document referred to was thereupon marked by the reporter Plaintiff's Exhibit 84 for identification.)

Mr. Gariepy: Q. Will you look at Plaintiff's Exhibit 84 for identification, Doctor. Was that written by you?

A. Yes.

Q. Was the attached carbon copy of the letter, dated December 9, 1937, addressed to Dr. Thomas Parran, also attached?

A. Yes.

Q. And that was in connection with this report?

A. Yes.

Q. Were the facts as recited in this letter to George D. Scott, dated December 9, 1937, true and accurate at that time?

A. Yes, I think they were, yes, sir.

Q. Then is it not a fact that Dr. Bundesen, on seeing you, was so definitely set against the paper container that he criticized you for not consulting him before you undertook the work?

A. No, sir.

1879 Q. Did you have any conversation with Mr. Dean regarding the results of your conference with Dr. Bundesen on this report?

A. I think I did. I know I saw Mr. Dean. I must have discussed that with him.

Q. Did you discuss anything further with him in regard to Dr. Thomas Parran and Mr. Leslie Frank of the United States Public Health Service as it relates to the use of the single-service container in the city of Chicago?

A. With whom?

Q. Mr. Leslie Frank.

A. To whom? I mean, I discussed it to whom?

Q. With Mr. Dean.

A. I don't recall.

Q. You may have had such a conversation?

A. Yes.

Q. And can't remember it?

A. Yes. I may have had it, yes, sir.

Q. Did he exhibit to you in any such conversation the original of a letter from the United States Public Health Service, addressed to him, signed by Dr. Leslie Frank, pertaining to the use of the single-service container in the city of Chicago?

A. Yes, I recall him showing me a letter. Yes, I know he did.

1880 Q. Did you have any conversation with him concerning that letter of Dr. Frank to him, a copy of which went to Dr. Bundesen, or not?

A. Yes, I know I did. Yes, I know we had a conversation about it.

Q. And did you not tell him in that conversation that Dr. Frank had gone through Chicago just recently and that Dr. Bundesen had seen him, so that this letter to Mr. Dean concerning the use of single-service containers in the city of Chicago would be cancelled?

A. I do not recall saying that. I don't remember whether Mr. Frank was through or not.

Q. You may have said so?

A. Yes, sir.

Q. And you may not?

A. Yes, sir.

Q. Who fixed the figure, Doctor, of $1,000 for this research work; you or George Scott?

A. It was at my suggestion, sir.

Q. On the basis of $250 a month?

A. Yes.

Q. Is it not a fact that the reason you received only

$250 was that you reported to Mr. Scott that Dr. Bundesen was so unalterably opposed to the paper milk container, that regardless of any more work that you could do on the question you would not be able to get a permit for its use in the city of Chicago?

1881 A. I don't think so, no.

Q. You may have said so and cannot remember it, is that it?

A. I don't think I had any reason to make that statement.

Q. Did you make such a statement, or do you remember it or not?

A. I don't remember it, no.

Q. Is it not a fact that you asked George Scott, at the Palmer House in Chicago, when you and he reviewed the report that you had prepared, in what form he wanted the permit.

A. I don't think so. The permit would have to be a written permit, passed by the Board, and I don't recall just—

Q. Did you ask the question?

The Master: Let him answer the question.

Q. You don't recall what?

A. I don't recall discussing it, because it is a fixed rule in the Health Department.

Q. You were not connected with the Health Department at that time?

A. No, I was not connected with the Health Department at all, no.

Mr. Gariepy: Q. Did you ask him, Doctor, my question is, as to the form in which he wanted the permit for the use of paper milk bottles in the city of Chicago?

A. No.

1882 Q. And the reason you did not ask the Ex-Cell-O Corporation or George Scott for any more than $250, or complete the work that you were to undertake for a period of four months, was because you found that your efforts and the Ex-Cell-O Corporation's money would have been wasted, isn't that true?

A. No, I don't think that is true.

Q. Why was it, then, that you did not go ahead with any further work for them? You were not on the Board of Health then, were you?

A. No. I understood from Mr. Scott that he was mainly

interested in getting a permit for distribution in Chicago, that is, the installation of his machine in Chicago, and was not interested in any further research work that I might be able to contribute, which would not be very much anyway, as I did not have a machine at my disposal to work with, and I think that reason was the reason we stopped there. There was no official resignation, nothing official about it.

The Master: Q. Was there any work you did that was any different from the work he had done before?

A. I don't do any work. I simply reviewed the material available and got a report. The only work I could say I did was the two interviews I had, one in Detroit and one in Geneva. I did no laboratory work, no work with
1883 the container or with the machine.

Q. Just what work did they hire you to do?

A. Compile a report.

Q. Didn't they have reports before?

A. There were isolated instances. The report of Dr. Prucha and Dr. Tracy and a report from the engineering department of Wayne University, and a report on paraffin, they were all isolated instances. My function was to get them all together, as in Exhibit 4.

Q. But you only rendered a preliminary report?

A. Yes, sir.

Q. What good was that, until you had everything finished?

A. That was as far as I went with this work.

Mr. Gariepy: Q. Why didn't you go any further with this work?

A. There was no request to go any further with it.

Q. Didn't you have some sort of an agreement for four months' work, Doctor, $1,000 at $250 a month?

A. Yes, in conversation with Mr. Scott. I understood on the telephone when I talked to him in Detroit there, he said, "We will let it stay the way it is," or, "I will let you know in the future," or something of that kind. It was left indefinite.

1884 Q. You left it indefinite or did he leave it indefinite? Who left it up in the air?

A. Probably both of us. Probably one as much as the other. I think we understood each other.

Q. Is it not a fact that you understood, after seeing Dr. Bundesen and after seeing this correspondence of Mr. Leslie Frank and Dr. Thomas Parran at Mr. Dean's office,

you fully understood that regardless of how much research work you did on the subject, you could not get a permit?

Mr. Schaefer: That is objected to.

Mr. Gariepy: No, he can answer that.

Mr. Schaefer: The witness' understanding is not material.

Mr. Gariepy: He told about Mr. Scott's understanding.

The Master: I will let him answer.

The Witness: A. I don't know whether I can answer that question.

Mr. Gariepy: Read the question, Mr. Golding.

(Mr. Gariepy's last question was read by the reporter as above recorded.)

The Witness: A. No.

Mr. Gariepy: Q. Did you tell George D. Scott that on the telephone one morning, from Chicago to Detroit?

1885 A. Yes. He was speaking of a permit within a short period of time, which I told him was impossible to get, as it would have to—there would have to be an inspection system or certification system of some kind developed, and it could not be developed quickly.

The Master: Q. Who told you that?

A. Dr. Bundesen.

Mr. Gariepy: Q. Was that in writing or verbal?

A. That was verbal.

Q. Was not one of Dr. Bundesen's objections to the paper milk bottle or the paper container that they were not recognized by the United States Public Health Service?

A. Yes, sir.

Q. Are they so recognized at this time?

A. Yes, the last modification.

Q. Were you present in January, 1939, when George D. Scott called at the office of the Board of Health and saw Dr. Robert A. Black concerning this permit?

A. No, sir.

Q. Were you not seated outside the door of that room with Mr. Paul F. Krueger?

A. I don't recall seeing Mr. Scott.

Q. Did you hear any conversation between Dr.

1886 Robert Black and George D. Scott on that occasion, concerning the issuing of this permit?

A. No, sir.

Q. You heard George D. Scott testify here?

A. Yes.

Q. Concerning that conversation?

A. Yes.

Q. And his asking Dr. Black what further they could do to secure this permit, to satisfy him and the Board of Health, did you?

A. Yes, sir.

Q. And you did not hear any part of it?

A. I was not in the room at all. I didn't know he was there.

Q. Or outside?

A. No, sir.

Q. Did the Ex-Cell-O Corporation and George D. Scott do everything that you requested or suggested or what you thought was necessary for the preparation of this preliminary report, up to the time that it was submitted to Dr. Bundesen?

A. Yes, sir.

Q. And up to the time that Paul F. Krueger saw it?

A. Yes.

Q. And you put in the three hours you mention in this letter of December 9th to George D. Scott with Dr. Bundesen going over this report?

1887 A. It was not all on this report, no, but there were several other things I discussed with him. I was there about three hours. I was there all afternoon, but I don't think it was all on that report. I cannot recall the conversation.

Q. Will you explain this phrase in this letter to George D. Scott, dated December 9, 1937, Exhibit 84: "I have never been concerned with a situation so hopelessly involved as yours."

What did you mean by that phrase, "hopelessly involved"?

A. I mean hopelessly involved, because so many questions were asked as to the origin of the paper, the handling of the paper, and there was the idea that there should be some sort of inspection and certification system; there was no machinery set up for it; it would take time to do it; and how the machinery was to be developed, where and by whom. For one seeking a permit, as Mr. Scott was, you cannot put your finger or could not put your finger on anything to make it move. That is what I referred to, sir.

Q. Is there any sort of inspection and certification system in the use of the glass milk bottle in the City of Chicago?

A. No.

1888 Q. But that is what you referred to concerning the paper bottle?

A. Yes, sir.

Mr. Gariepy: Mr. Reporter, will you mark this Plaintiff's Exhibit 85 for identification, and this Plaintiff's Exhibit 86.

(The documents referred to were thereupon marked Plaintiff's Exhibits 85 and 86, respectively, for identification.)

Mr. Schaefer: Q. When you say there is no inspection, you do not mean there is no inspection of the glass bottle, do you?

Mr. Gariepy: Mr. Schaefer, will you please. I have the witness. I did not interrupt you.

Mr. Schaefer: All right.

Mr. Gariepy: Q. Will you look at Plaintiff's Exhibit 86, a letter dated November 29, 1937, on the stationery of the Treasury Department, signed "Leslie Frank." (Handing document to the witness.)

A. Yes, sir.

Q. Is that the letter that you referred to when I asked you concerning correspondence between Mr. Frank and Mr. Dean regarding the use of the single-service container in the city?

A. Yes, sir.

1889 Q. Will you look at Plaintiff's Exhibit 85 and tell me whether you ever saw that letter in the presence of Mr. Dean or at his office?

A. Yes, I saw that at his office, yes, sir.

Q. And is that the letter over which you had this conversation which you said might have taken place but you did not remember?

A. Yes.

Q. Dr. Arnold, is it not a fact that after you saw this correspondence at Mr. Dean's office, you then and there told him that you thought that you saw the handwriting on the wall and there was no use of going any further, that Dr. Bundesen had saved or helped Mr. Frank in his job and you could not do anything more on it?

A. I don't think I said that.

Q. Will you say you did or did not make any such statement?

A. I did not make it.

Q. You did not make it?

A. I am sure I did not, no, sir.

Q. Did you say that to him when you were going over to see Dr. Herman Bundesen with Plaintiff's Exhibit 4 here?

A. I don't think I said that at any time, no.

1890 Q. The Master asked you a few minutes ago concerning your work in preparing this report. Did you not go to the Chicago Carton Company?

A. Yes.

Q. The fabricating plant where it was proposed to obtain cartons to use?

A. Yes, I did.

Q. And you reported upon the conditions concerning sanitary methods employed at said plant here?

A. Yes.

Q. And they were, in your opinion, sanitary?

A. Yes.

Q. Didn't you go to the Risdon Dairies, in Detroit, using the Pure-Pak single-service containers, and inspect the operation there?

A. Yes.

Q. And how long did you spend in the dairy inspecting the machine in actual operation bottling the milk?

A. I think the forenoon.

Q. All morning?

A. At least two or three hours, I think.

Q. Did you not make inquiry at the Providence Hospital in Detroit concerning their experience with single-service containers with patients in the hospital?

A. Yes.

1891 Q. From a public health standpoint?

A. Yes.

Q. Didn't you receive a reply that it was favorable?

A. Yes.

Q. That they found no contagion and no cause for denying their use to hospitals?

A. Yes, sir.

Q. Was it that experience and that information so obtained that caused you to recommend to Dr. Bundesen that the use of such containers in hospitals was one of the great advantages in the use of single-service containers?

A. That was part of it, yes.

Q. Then you were recommending the use of single-service containers in hospitals, for people that were sick and not up to par, but you do not recommend it for people that are in normal condition of health, is that it?

Mr. Schaefer: I object to that.

The Master: I will let him answer.

The Witness: A. No, I don't think so.

Mr. Gariepy: Q. But you do recommend it for people in hospitals?

A. If it is non-porous, which I thought it was at that time.

1892 Q. Then the non-porosity is the whole crux of the thing, isn't it, Doctor?

A. That is one of the principal factors.

The Master: Q. Do they use these single-service containers at the present time in hospitals?

A. In some hospitals, yes.

Q. In Chicago?

A. No, sir, not in Chicago.

Q. I suppose it would be a matter of judgment as to which would be the greater danger, wouldn't it, as to whether sick people might be made well by the use of the single-service container, or whether well people might be made sick by the use of some milk bottle that had been used in a sick room?

A. Yes, sir, that is right. It is a two-sided equation.

Q. But they do not use, you say, in Chicago, this single-service container even for contagious diseases?

A. No, sir.

Mr. Gariepy: Q. Do you know of any hospitals in cities that use the single-service container where they do not use it in the hospitals, like New York City, Philadelphia, Los Angeles, San Francisco?

A. I am not familiar enough with it to know, sir.

The Master: Q. Is there anything in this United
1893 States Health Ordinance on the subject that you know of?

A. On which subject, Master?

Q. On the use of single-service containers, in the sick room?

A. No, sir, not that I know of.

Mr. Gariepy: Q. Doctor, I take it that you have not checked the cities that are using the single-service container during the past two years, nor the amount of the use, that is, bottles per day, nor the extent of the use of the single-service container in hospitals.

A. No, sir.

Q. And without having that information, you consider

yourself competent to pass upon the merits, from a public health angle, of the single-service container, do you?

A. Yes, sir.

Q. And without knowing any diseases that have been contracted by reason of the use of the single-service container in the cities and villages that have had it and at hospitals that have permitted its use, you are still of the opinion that you are qualified to say that the single-
1894 service container presents a health problem?

A. Yes, sir.

Q. Were you in the Ex-Cell-O Corporation plant in Detroit when you went to make this survey?

A. Yes.

Q. Did you inspect the operation in the plant?

A. Yes. They started a machine for me in the plant.

Q. And how long did you put there in the plant watching the machine operate, in order to ascertain the health problem involved?

A. You could not tell the health problem involved from an empty machine running.

Q. From anything that it showed, with regard to metals used and so on?

A. I think it was very good. I was there two or three hours; two hours, probably.

Q. How many employees are used in filling milk on the Pure-Pak machine?

A. I don't remember. They were in the dairy, but I don't know how many were there.

Q. If I told you that only two men are employed, one at the end to take it out when it is finished and one at the other end to inspect the blanks, would you say I was wrong?

A. No, I would not say so.

Q. How many men are employed in a bottling plant
1895 from the time the bottle leaves the sterilizer and the last wash to the time it is capped and filled?

A. About three.

Q. Three?

A. Yes.

Q. The number of people that are employed in that filling process becomes a health problem, because of this human contamination element?

A. Yes.

Q. And the lesser employees used the lesser the health hazard?

A. Yes.

The Master: Do I understand you to say that the lesser the number of employees the lesser the health problem?

Mr. Gariepy: Yes. The less mechanical handling there is.

Q. Is that right, Doctor?

A. The less possibility of contamination.

The Master: Q. Let us turn it around. Let us assume that one of the men is very much diseased and you would get the full benefit of his contamination, where if you would distribute the work among more you would not get so much.

A. That is quite true, but the man would not be in the milk plant, under supervision, if they knew anything about it. Whoever holds the permit would be in violation
1896 of the ordinances and would stand the danger of revocation of his permit.

Q. But that sick man among a great number would not have so much work to do on the particular containers?

A. That is true in that respect, yes.

Mr. Gariepy: Q. And that sick man's condition could be detected in the plant distributing milk in Pure-Pak containers just as quickly and easily as in the plant putting up milk in glass bottles?

A. Yes.

Q. The inspector would find that out?

A. Yes.

Q. Did you open the paraffin bath in the machine at the Ex-Cello-O factory?

A. I probably did. I don't recall specifically anything specific about it, but I am sure I saw most all parts of the machine.

Q. Did you examine it at the Risdon Dairies, when the machine was bottling milk there?

A. I think I did, yes. I watched the machine, at least.

Q. Were either of these machines at this time giving off any rancid odors?

A. Not that I recall, no.

Q. Does paraffin in its natural state have a sweet odor?

A. I would consider it odorless.

Q. You would consider it odorless?

1897 A. Maybe it is not.

Q. When did you first become acquainted with the acidity possibilities of the oxidation of paraffin, Doctor?

A. As a student in chemistry.
Q. How many years ago was that?
A. Oh, it was a number of years ago.
Q. Well, it was all previous—
A. Twenty years ago.
Q. How?
A. Twenty years ago, I suppose.
Q. Twenty years previous to the time you handed in Plaintiff's Exhibit 4?
A. Yes, sir.
Q. Did you make any comment in that Plaintiff's Exhibit 4 concerning the possibility of oxidation of paraffin, the acidic possibilities?
A. I did not think it would oxidize. I did not think it was in there long enough to oxidize. I did not know that was a factor.
Q. Do you know how long it was in there?
A. I was told two hours.
Q. From the one day experience that you had at the Ex-Cell-O factory watching the operation of the machine and also your morning at the Risdon Dairies and then your conference with Dr. Vaughn and Mr. Palmer and Dr. Meater, as the result of those three check-ups, did you see anything which then appeared to you to present
1898 a public health problem concerning the use of this paper milk container?
A. No, sir.
Q. Did you ever visit the Detroit Sulphite Paper and Pulp Company?
A. No, sir.
Q. Did you at any time during this month that you did this work for Mr. Scott or the Ex-Cell-O Corporation request any money to go and visit a paper mill?
A. No, sir.
Q. You did not consider it necessary at that time, did you?
A. No, sir.
Q. Did anything that Dr. Bundesen uttered in the conversation with you in December, 1937, change your opinion about the suitability of the Pure-Pak container for the sale of milk?
A. No, sir.
Q. You still believed that these Pure-Pak containers presented no public health hazard after your conference with Dr. Bundesen?

A. Yes.

Q. Do public health standards, even of the most stringent type, for milk, require absolute sterility of the milk container?

A. No, sir.

Q. Then sterility or freedom from bacteria is a
1899 matter of degree, isn't that true?

A. Yes.

Q. Is the United States Public Health Service model ordinance and code generally considered a reasonable standard for milk sanitation?

A. Yes.

Q. And safe?

A. Reasonable and safe standard for milk sanitation, Doctor?

A. Yes, sir.

Q. The reason that the city of Chicago Board of Health is working on a revision of its ordinance is that, if approved by the city council of the city of Chicago, the city will continue to then be on the approved list of the United States Public Health Service, isn't that true?

A. I think so.

Q. Is it not a fact that the approval of the United States Public Health Service is accepted by all of the agencies of the federal government, in lieu of an inspection into things like interstate commerce, where the Interstate Commerce Commission had jurisdiction, and air travel, over which the Civil Aeronautics Authority has jurisdiction?

A. I could not answer that question. I do not know.

Q. Have you had occasion to take a plane ride
1900 in the last two years, from here to Philadelphia or New York?

A. No, sir.

Q. What?

A. No, sir.

Q. When you went attending the depositions you went by train?

A. Sure.

Q. Do you know whether or not, Doctor, they use paper milk bottles in the airplanes, on traveling to the east?

A. I do not know.

Q. What is that?

A. I do not know.

Q. Did you ever investigate that?
A. No, sir.
Q. You went on the train?
A. Yes.
Q. Is it not true that milk packed and delivered in paper bottles is used on the New York Central Railroad, which is subject to the jurisdiction of the Interstate Commerce Commission?
Mr. Schaefer: I object to that.
The Master: Sustained.
Mr. Gariepy: Q. Did you notice, Doctor, any use of the paper bottle on the New York Central Railroad on this trip?
Mr. Schaefer: I object to that.
The Witness: A. No.
1901 Mr. Gariepy: He says he did not, Mr. Schaefer, so it is all right.
Mr. Schaefer: That doesn't make any difference. It is still objectionable.
The Master: Go ahead.
Mr. Gariepy: Q. You are a member of the Board of Health now?
A. Yes.
Q. Don't you consider it your duty to consider the extensibility of the use of paper containers on carriers?
A. No.
Q. In hospitals?
A. No.
Q. For children and the sick and so on?
A. No.
Q. You don't consider that necessary?
A. No.
Q. Doctor, if the control of milk is an ever-changing problem, as you testified on direct examination, is not the experience of public health authorities throughout the country—and I am referring to public health authorities of cities—to be considered in determining whether or not the paper container presents a public health hazard?
A. Yes, possibly it is, yes.
Q. But you made no investigation?
A. No, sir.
1902 Q. Are you the advisor of the Board of Health on this point?
A. No, I don't think so.

Q. Who is?

A. I don't know.

Q. From the selfish standpoint of a mill operator making paper board intended for milk containers, is it not desirable for him to have healthy logs?

A. Yes.

Q. I think you mentioned moss on these logs and a cinder bed.

A. Yes.

Q. Is it desirable for him to clean out pitch pockets?

A. Yes.

Q. Regardless of whether he uses your cinder bed that you mention, is it desirable for him to keep the logs, whether bottom or top, free from whiskers of mould, as you put it?

A. Yes, sir.

The Master: Off the record.

(Discussion had off the record.)

Mr. Gariepy: Let me ask the witness this question.

Q. Doctor, do you know the mills that are making paper board for milk bottles today that have logs that have mould and whiskers on them and that are seated or allowed to rest on wet ground, and so on?

1903 A. No, I do not.

Q. Do you know of any mills that are making paper board that permit employees to work there where they do not have methods and means for keeping their hands clean, so as not to soil the paper board?

A. I don't know, no, sir.

The Master: Q. Do you know one way or the other?

A. No. I am not familiar with enough mills, Master, to draw comparisons.

Mr. Gariepy: Q. Is it not a fact, Doctor, that paper board from pulp manufactured by the chemical process would have to be sterilized by the time it reaches the calender stack, and if any of the logs have not been healthy, logs out of which this pulp is made, and if any pitch pockets have not been removed from these logs, or if the logs have not been kept dry or if the broke or trim you referred to yesterday that is being used sometime that in the manufacturing had been permitted to fall on the floor, that this pulp would be sterilized in the process?

A. In which process?

Q. Going through the mill.

The Master: You mean the chemical process?

Mr. Gariepy: The chemical process.

1904 The Witness: A. The chemical process or the other process?

Mr. Gariepy: Q. The chemical process.

A. The chemical process, yes.

The Master: Q. And to that extent you would say that is a sort of a self-purifying procedure?

A. Where it is heated in alkali, under high pressure and temperature.

Q. I say, if any bacteria during the process has gotten into the material, the rest of the process will tend to remove or destroy those bacteria?

A. Yes. But the great danger is when you have those logs around, having them come into the mill on conveyors, handled by the men, getting on the floor and in the air, you have got spores of mould that get on the shoes of the men, and they track them in the plant, and you get them into the pulp after it is clean. You get contamination in the pulp from spores brought in from a wood pile. That is a great danger.

Mr. Gariepy: Q. Will you recite one instance that you know of where the spores have gotten into the paper board in the mill by reason of the men tracking about there and so on?

A. Why, no. It is just common knowledge that 1905 those things do take place.

Q. You do not know the answer to that, do you?

A. I know of spores being transmitted through laboratories and through hallways and medical schools and office buildings, and the same thing could take place in a paper mill.

Q. And in a glass bottle dairy?

A. Yes, in any dairy.

Q. Do you know of any paper manufacturer making paper for milk bottles that is using chip at this time?

A. In what respect using chip?

Q. In the manufacture of this board.

A. For milk bottles?

Q. Yes.

A. No.

Q. It is easy to determine whether or not chip has been used in the manufacture of this board, is it not?

A. Yes.

Q. How would you determine it?

A. By chemical analysis, by staining the board.

Q. You could take it right here in the city of Chicago and do it, couldn't you?

A. You could disintegrate the board and use stains. You can tell the fibre, the amount of cooking and how
1906 many times it has been cooked and various things, from the stains that the paper chemist uses.

Q. You could do that right in the laboratory of the Board of Health here in the city?

A. Yes. It is a very acceptable method.

Q. Is it not a fact that reused waste paper or chip contains inks which discolor the paper and give it a greyish cast?

A. No.

The Master: Q. Doesn't it have a tendency to sort of blotch the paper?

A. Yes, it does, Master, providing you use chip on the outside, but these people who use chip board cover it with a virgin pulp, and what you have is a virgin pulp layer on both sides, with chip in the middle. That is common practice of those who use chip for that purpose.

Mr. Gariepy: Q. Then you can see it by trying it?

A. You can't see it without staining.

Q. You said those people that use chip in the board. Name some of those paper companies that are making paper board for milk containers that do use chip in it.

A. I don't know of any of them making paper con-
1907 tainers that use chip.

Q. Have you performed any tests to ascertain the amount of chip in a paper board?

A. No, sir.

Q. You testified yesterday that chip contains much bacteria. How do you know this?

A. I have disintegrated the board that contained chip.

Q. When did you do that?

A. I did that in 1938.

Q. And this board containing chip contains more bacteria than board made out of the virgin spruce pulp, doesn't it?

A. Yes.

Q. Then this shows, Doctor, to you, doesn't it, that there are tests that you are willing to rely on, that indicate the amount of the bacteria in the paper?

A. They are the best tests we have, yes. We have to rely on them.

Q. Wouldn't it be reliable enough for you to form a judgment and testify about it?

A. Yes.

Q. If paper is manufactured with poluted water supply, will any harmful bacteria survive the drying rolls, leaving out of consideration the calendering operation of the mill?

1908 A. Yes, I think they would.

Q. Have you ever had any experience finding it so?

A. I have found bacteria.

Q. When?

A. In paper.

Q. When?

A. In 1938, that have come from the river.

Q. What river?

A. Oswego River.

Q. Did you ever get any paper board from Cherry River or from Ex-Cell-O or American Can that had that in it?

A. They have bacteria of the same kind, yes.

Q. Did you get some like it?

A. Yes.

Q. When did you get paper board from Ex-Cell-O or from American Can, used for paper milk bottles, that had this same kind of bacteria in, that you referred to, in 1938?

A. In the spring of 1938, Dr. Fitzgerald sent them to me from the American Can, and I got some from Mr. Scott from the—they were some of the package that he had sent in to me.

Q. Did you ever report that finding and that result to these two men?

A. No.

Q. You didn't testify to that on direct, did you, Doctor?

A. Well, bacteria in paper—

1909 Q. No, no, Doctor, you did not testify to that on direct, did you?

Mr. Schaefer: I object to that.

The Master: The record will show.

Mr. Gariepy: Q. What part of the paper does the calendering operation apply to, Doctor?

A. The surface.

Q. And what does it do to the surface?

A. Shines it, gives it a shiny, hard gloss to the surface of the paper, on both sides.

Q. Does it make it impervious to bacteria from the air or not?

A. No, I would not say impervious, no.

Mr. Gariepy: Do you want to go ahead, Master? I have got at least an hour or an hour and a half more, and it is now 12:33.

The Master: We might as well meet again at two o'clock, then.

Whereupon, a recess was taken to 2 o'clock p. m. of the same day, Friday, October 13, 1939.

1910 (Caption—)

Friday, October 13, 1939,
2 o'clock p. m.

Met, pursuant to recess.

Present:

Mr. Gariepy,
Mr. Rall,
Mr. Schaefer,
Mr. Horan.

1910 The Master: You may proceed.

LLOYD ARNOLD, called as a witness on behalf of the defendants, having been heretofore duly sworn, resumed the stand and testified further as follows:

Cross-Examination by Mr. Gariepy (Continued).

Q. Doctor, you testified on direct examination with regard to ice cream in paper containers, that you had control or the Board of Health had control of what went into the ice cream, is that correct?

A. Yes.

Q. You also have control of the quality of the milk in paper containers, do you not?

A. We don't have milk in paper containers.

Q. Well, places that permit the use of milk in paper containers have control of the milk, don't they?

A. I think so.

Q. Is not that control comparable to the control you have of the ingredients that go into ice cream that is sold in the city?

A. Yes.

Q. And when the ice cream is put in those paper containers that you referred to, you said it was frozen
1911 and therefore the possibility of contamination was not so great?

A. Yes.

Q. Does not that ice cream melt within a short time after it is put in the container and taken home from the drug store?

A. It might. It softens, not melts.

Q. And when it softens does not that bridge you referred to exist between the paper carton side and the melted ice cream?

A. I don't think to the same extent.

Q. There is a bridge there?

A. Ice cream is viscous. It is heavy.

Q. There is a bridge there, isn't there?

A. What?

Q. A bridge?

A. No, I wouldn't consider it a bridge in the sense of an aqueous bridge.

Q. Doctor, are you a pediatrician?

A. No, sir.

Q. Are you a gastro-intestinal expert?

A. I have done considerable work on the gastro-intestinal tract.

Q. Have you done considerable work on the gastro-intestinal tract of infants?

A. Yes, sir.

Q. Have you in your experience as a gastro-intestinal doctor or expert ever found any occasion or inci-
1911-A dent, rather, where a child was afflicted or diseased by reason of the swallowing of paraffin?

A. No, sir.

Q. Have you ever had any experience or do you know of any experience of anyone, or have you ever read of the experience of anyone where spicules of paraffin were found in the intestinal tract of a child?

A. I do not recall any, no, sir.

Q. Or of an aged person?

A. I do not recall any.

Q. Or from the drinking of milk in paper containers?
A. No, sir.
Q. The word "paraffin" itself is a combination of two words, two Latin words, is that right?
A. I don't remember.
Q. "Parum" and "affinis," is that right?
A. I don't know. I couldn't say. I am not versed well enough in languages to dissect a word.
Q. You testified further on direct, Doctor, that oysters used in paper containers, in your opinion, did not present a health problem, because the oysters are usually cooked, is that right?
A. Yes, sir.
Q. Are all oysters sold in paper containers cooked?
1912 A. I don't know. I think the most of them are. I think the majority are.
Q. You know that a lot of people eat oysters raw and they have oyster cocktails.
A. I thought they were shelled oysters.
Q. You know they have oyster cocktails, that you can put in a cocktail glass?
A. Yes.
Q. With some red pepper and some seasoning.
A. You put it in an alcohol solution, then.
Q. And you can buy those same oysters in paper containers, can you not, Doctor?
A. I presume so.
Q. Now, if there is any contamination at all, Doctor, how long a period of time must elapse before the contamination will set in, or is it momentary?
A. I hardly think it is momentary.
Q. How long a period of time must elapse, then, before such contamination from the use of the paper container for oysters would set in?
A. I have never determined that.
Q. Do you know of anyone who has?
A. No, sir, I do not.
Q. Do you know of anyone whoever used or secured oysters in paper containers who contracted disease from the paper container?
1913 A. Not to my knowledge, no, sir.
Q. Is it not a fact, Doctor, that dry air tends to kill non-spore forming bacteria?
A. Yes, sir.

Q. Is it not true, Doctor, that any contamination from water used in paper mills in the calendering process or from cold rolls, which you described on your direct examination, is a surface contamination and not a contamination in the body of the fibre board itself?

A. Yes, sir.

Q. That is also true of contamination resulting from the handling of the paper manually in the mill, is it not?

A. Yes, sir.

Q. And from the handling at the converting plant?

A. Yes, sir.

Q. You consider, do you not, that the paraffining operation, has some bactericidal effect, do you not?

A. Yes, sir.

Q. If the containers before being paraffined are essentially sterile, then the bactericidal effect of the paraffin operation is relatively unimportant from a public health standpoint, is it not?

A. It depends on what you mean by relatively sterile.

1914 Q. Well, as sterility is known in the industry and as regards public health, as sterility is known among public health officials.

A. Sterility means the absence of all bacteria.

Q. Is there such a thing known in the milk industry as absolute sterility in containers?

A. No.

Q. With regard to this manual handling and this manual contamination, is this surface or manual contamination easier or more difficult to discover than the contamination in the interior of the paper board?

A. I think they are both about the same. I do not believe there will be a great deal of difference in the method of detection.

Q. Is it not a fact, Doctor, that the number of live bacteria decreases with time on paper board?

A. Yes.

Q. How long, in your opinion, would a non-spore forming bacteria live on a dry surface of paper containing, we will say, five per cent moisture?

A. Depending in what medium the bacteria was deposited.

Q. Suppose it is deposited in no medium; just placed on the board?

A. I don't see how you could do that.

Q. You could not do it?

A. It is impossible.

1915 The Master: Q. What is impossible?

A. For a bacterium to be deposited on the surface of a paper board without being suspended, adhering to something, just a single bacterium by itself. I don't know how we could do that. You would have to put it in water or—

Q. Could not it remain on the board?

A. It might remain on the board, but it would be mixed up with something, from the source of it, either from the soil, with a little dirt or dust particle, or moisture.

Q. Let us say you put a colony of bacteria on the outside of the paper board.

A. That would last for days, and certain weeks.

Q. The paper board contains five per cent of moisture.

A. I would say it would last in terms of days or weeks.

Mr. Gariepy: Q. Does that answer apply to non-spore forming bacteria?

A. Yes, sir.

Q. Have you ever tried it?

A. Yes, sir.

Q. When?

A. In 1938, the spring of 1938, with the disinfecting power of warm paraffin or hot paraffin.

Q. You said on direct examination that a dry surface kills bacteria by desiccation. How do you account for

1916 the greater bactericidal effect of paraffin on wet paper than dry?

A. Because of the heat. When you heat water, you get a very penetrating substance that penetrates the cells and destroys them. That is the influence of moist heat on bacteria. It is very detrimental to bacteria.

The Master: Q. What is the temperature at which bacteria would die?

A. In moist heat?

Q. Take them both ways. A Bacterial death is always in relation to temperature and time. Boiling water will kill most bacteria, non-spore bearing.

Q. What temperature is that?

A. That is 100 centigrade or 212 Fahrenheit. It will kill them in five minutes, five to ten minutes. Usually five minutes boiling will destroy most of the non-spore bearing bacteria.

Q. What dry heat would be required?

A. 100 centigrade of moist heat takes about 160 of dry heat, for about an hour or an hour and a half, to do the same thing.

Mr. Gariepy: Q. Is it your opinion, Doctor, that the results of Dr. Prucha's experiments on the self-
1917-8 purification of paper are false or misleading?

A. No, I don't think they are either false or misleading.

Q. Is it your opinion that the surface of the wet plaque is so much dryer than the surface of the paper which had not been dampened that in the case of wet paper the process of dessication kills more bacteria than on the dry?

A. I didn't get that question.

Mr. Gariepy: Read it, Mr. Golding.

(Mr. Gariepy's last question was read by the reporter as above recorded.)

The Witness: A. I still don't understand the question. How could the surface of the wet paper be dry?

Mr. Gariepy: Q. As I understood you to testify on direct examination, the fibres pulled it in and left the bacteria.

A. Yes. That is on the wet plaque.

Q. On the wet paper?

A. Yes, containing bacteria in suspension, in the water.

Q. And on the dry plaque you say it has less bactericidal effect?

A. Yes.

Q. How do you account for that?

A. Because there is not any water to be pulled in.

1919 Then the drying means nothing?

A. Yes, sure, it means something.

Q. What does it mean?

A. You are applying bacteria dry to a dry plaque or wet? Which do you mean?

Q. Dry.

A. If you apply bacteria in a dry state to a dry plaque, you haven't any water, and they survive for a long period of time.

Q. The water keeps them living, or doesn't it?

A. There isn't any water there.

Q. If there is water on the board or in the board, does it keep them living or not, the bacteria?

A. I don't think it has much influence in the ordinary

board, the five per cent water. That is a pretty low water content.

Q. The question to you, Doctor, is, does moisture in the board tend to keep bacteria alive or not?

A. Yes, it will tend to keep them alive.

Q. In your experience and from the experiment you say you performed, how many weeks did non-spore forming bacteria keep alive on the dry board?

A. I didn't run it more than two weeks.

Q. And they kept alive?

A. Yes.

Q. The two weeks?

A. I found them at the end of two weeks. I did not carry it any further.

1920 Q. And did you identify them as the inoculating organisms or not?

A. Yes.

Q. Did you ever write up anything on those experiments from a public health standpoint?

A. No, sir.

Q. Did you make any tests to find out whether this same quality of bacteria lasts longer on glass than on paper?

A. No, I did not.

Q. Assuming that a paraffin bath is heated to a temperature of 185 degrees, is changed every two or three hours, do you have an opinion as to whether the paraffin would oxidize sufficiently to cause any acids which would be harmful to health?

A. Is the paraffin bath completely changed?

Q. Yes.

A. No, if there was a complete change.

Q. What experiments have you performed, Doctor, to determine whether any acids in paraffin are harmful?

A. None.

Q. Is it not a fact that milk has more acidity than any of the acids shown by Mr. Martinek in his experiments here yesterday?

A. Acidity, yes.

Q. And are these acids organic?

A. Yes, sir.

1921 Q. And are these acids organic in the oxidation of paraffin?

A. Yes, there is a variety of organic acids there.

Q. Let us assume that enough oxidation in a paraffin

bath is made to form acids of the maximum strength testified to by Mr. Martinek yesterday, and assume that this paper container is immersed in the paraffin bath; then assume it is cooled afterwards, until the paraffin is hard. In what form would the acid, if any, appear on the interior of the carton?

A. In the concentration that it is in the paraffin and on the surface of the paraffin exposed, according to the surface exposure of the paraffin and the amount of acid contained.

Q. Is it solid or liquid?

A. It is solid, with the paraffin.

Q. Did you mean on direct examination, Doctor, to say that if the interior of a quart of milk contains nothing of the solidified acidic substance, enough of this solidified acidic substance would get into the milk to make a health hazard?

A. What is that question?

Mr. Gariepy: Read it.

(Record read as above recorded.)

1922 The Witness: A. Those substances are soluble in milk and water.

Mr. Gariepy: Q. Would enough of them get in there to present a health hazard?

A. I don't know. They would be adulterants to the milk, but I don't know the toxicity of those adulterants.

Q. Did you perform any experiments to ascertain that, Doctor?

A. No, sir.

Q. Do you know of anyone that has?

A. Not to my knowledge.

Q. Is it not a fact that this would have to chip off in order to present any problem at all?

A. No, I don't think so.

Q. Staying right on the board surface itself presents a health hazard, is that correct?

A. Those decomposition products of paraffin are acids of various types and they are unsaturated acids, that is, they are altered paraffin. They are decomposition products of paraffin.

Q. Are not they weak organic acids?

A. They are organic acids and they are irritating organic acids and they are not the same organic acids as developed in the bacteria of milk.

Q. Do you know of anyone who has ever suf-
1923 fered any illness or irritation by reason of these acids being found in a paper milk bottle?

A. No.

Q. Have you ever heard of anyone like that?

A. No.

Q. Have you ever heard of anyone becoming ill by reason of oxidation of paraffin used in a paper milk bottle?

A. No.

Q. Did you make any experiments to ascertain the amount of the adhesives that come in contact with the milk in a Pure-Pak container?

A. No.

Q. Did you perform any experiments or experimental tests of the quality of these adhesives used on a Pure-Pak container or paper milk bottle?

A. I have of paper milk bottles, but not of the Pure-Pak type.

Q. When did you do that, Doctor?

A. In the summer of 1938.

Q. You determined that chemically, did you?

A. Well, no, bacteriologically.

Q. How?

A. By cultiure.

Q. Do you consider these adhesives that are found on this container harmless or not? I am talking about
1924 being harmless to public health.

A. No, I would not say they were harmless, no.

Q. Do you know of anyone who has become ill or do you know of any instance where disease has been created or spread by reason of the adhesives used on paper milk bottles?

A. No, sir.

Q. Do you ever perform or cause to be performed for the Board of Health of Chicago any test to determine whether the adhesives used in the Pure-Pak container get into the milk?

A. No, sir.

Q. Did you test the adhesives, Doctor, on the side seams of the paper milk bottle?

A. Yes.

Q. And on the bottom seal of the paper milk bottle?

A. Yes.

Q. Both could be tested bacteriologically, as you put it, rather than chemically, is that right?

A. I tested the adhesive as it was being applied in the molten state, obtained the sample and tested the adhesive as to its bacteriological content.

Q. As I understand, Doctor, you never performed any tests on the adhesive on the Pure-Pak container?

A. No, sir.

1925 Q. Do you know of any incident or have you ever heard of any experience of anyone or of any health official with regard to lead in the ink used on the outside of the paper container coming into the milk?

A. No, sir.

Q. Have you ever heard of anyone becoming ill or sick by reason of the printing on the outside of the container?

A. No, sir.

Q. You were here when Mr. Fisher of the Gardner-Richardson Company was testifying, were you not?

A. Yes.

Q. Do you recall his tearing the paper board blank to show the number of layers of paper, as to whether the ink penetrated or not?

A. Yes.

Q. You could see by the tearing of that paper blank how far the ink went, couldn't you, Doctor?

A. I think so.

Q. Did you ever measure this amount of offset that you referred to on your direct examination and said came on to the inside of the paper container?

A. That is so variable in various types of containers and at various times. It is not uniform.

Q. Did you ever measure it, was the question?

1926 A. No, I never have measured it.

Q. The amount of it?

A. No.

Q. Is it not a fact that the amount, if any, is so slight that it cannot be measured?

A. No, I don't think so. You can measure it. You can see it and you can obtain it and measure it, if you want to measure it.

Q. In the spring of 1938 or the summer of 1938, did you perform any experiments to ascertain the amount and the effect of this offset on milk in a paper container?

A. No, sir.

Q. Have you conducted any investigation to ascertain

the presence of offset in Pure-Pak containers used by the plaintiff here?

A. No, sir.

Q. Is it not a fact, from your observation, Doctor, here at the trial and the exhibition of these paper blanks, that if any offset occurs it occurs at a point or place on the blank less likely to chip and crack?

A. I don't think so, no.

Q. There is not any printing on the corners, is there?

A. No.

1927 Q. The printing is on the flat surface, on the gable roof and on the sides, is it not?

A. It depends on the way the blanks are stacked as to where the offset is.

Q. Did you observe any time in here with any blanks or with Plaintiff's Exhibit 2, which was the container we had, any offsets on the corners, where there was creasing or cracking or fracture?

A. I do not recall that particular container.

Q. Doctor, does this offset have anything to do with the matter of a good job of paraffining or proper paraffining, or not?

A. I don't think it influences that.

Q. Did you ever measure the amount of metal in the offset on a paper bottle?

A. No, sir.

Q. Have you performed any test to determine whether any metal gets into the milk from the offset?

A. No, sir.

Q. Or are there tests to determine that?

A. I think it could be determined, yes.

Q. But you have not done so?

A. No, sir, I have not.

Q. What is the largest possible amount in any standard measurement which you are able to give us of the metal which could get into a quart of milk from the worst

1928 job of offsetting that you have ever seen on the inside of a paper milk bottle?

A. I could not answer that.

Q. You testified on direct examination that the lead in this offset presented a health problem.

A. It does. It contains lead.

Q. But you never measured the milk or the amount of offset or the lead in the offset?

A. No. But lead is poisonous and it is adulterant to milk.

Q. But you don't know whether it gets into the milk or not from the offset, from the printing.

A. No, but there is a possibility of it.

The Master: Q. When you say it presents a health problem, do you mean there is actually a danger after the problem has been solved, or what do you mean?

A. I mean that there is a health hazard there. Hazard should be the word, Master, instead of problem.

Q. You mean there is a question there as to which there should be some attempt to solve?

A. Yes, there should be some attempt to solve. It certainly presents, from my knowledge of public health and bacteria and chemistry, a health hazard. It is something that is potentially harmful to health.

Q. Although you do not know the answer in a 1929 particular case?

A. I cannot give you figures. I do not know the methods well enough to determine the chemical reaction.

Mr. Gariepy: Q. Have you made any effort to ascertain from other health authorities where the paper milk bottle is being used what their experience has been with regard to this health hazard?

A. No, sir.

Q. Whether they found it real, or just a conjecture?

A. No, sir.

Q. You still want the Master to believe that the possibility of metal poisoning is present in the case of the use of the paper milk container because of the possibility that the offset would not be properly sealed with the paraffin and escapes into the milk, is that it?

A. Lead is poisonous.

Q. No, answer my question. Do you want the Master to believe that?

A. Yes, I do.

The Master: Let us get this straight.

Q. Is your department concerned only with health, or also with the taste, for instance, of milk, and other considerations?

A. Yes, we are concerned with the taste of milk, Master.

1930 The Master: What I am trying to get at, Mr. Gariepy, is whether your position is that it would

be unobjectionable if milk should contain a little lead and a little paraffin and a little something else, which it does not contain, we will say, in glass bottles.

Mr. Gariepy: No, that is not our position. Our position is that it is absurd to contend that there is lead in the offset or in the inks used and that that lead gets through the five layers of board into the milk or has at any time since paper containers have been used by public health officials.

The Master: What I would like to find out is this. You see, you are asking question now to bring out whether there is really any danger.

Mr. Gariepy: Real danger.

The Master: To health.

Mr. Gariepy: Yes.

The Master: Now, I am asking you if in your view it is unobjectionable, if there is not any actual danger, if there might be a trace of lead or might be some paraffin or might be some of these other things in the milk?

Mr. Gariepy: Our position on the lead conjecture is
that it is absurd, and if any lead should get through
1931 the five layers of board into the milk, such an in-
finitesimal amount would get in there as to not present any health problem at all.

The Master: I thought the Doctor's testimony the other day was not that the lead got through the five layers, but that the lead adhered to the underside of the board above, the one on which the printing had been done.

Mr. Gariepy: I asked him on cross here whether he knew of any instance where this offset on the inside, as he put it on direct, on the inside of the board, presented any problem concerning illness or sickness at all to persons by reason of that.

The Master: Now, I am going one step further. I say, let us assume that there is not enough lead and there is not enough paraffin that gets into the milk to cause a danger to health. Is it still objectionable on the ground that you may possibly get a foreign taste into the milk or you may get something in the milk that should not be there? I assume that the Board of Health concerns itself not only with things that may cause an injury to health, but also with anything that might get into the milk that should not get in.

Mr. Gariepy: Palatable or unpalatable?

1932 The Master: Palatable, or whether it appeals to the taste of people, whether they like to have anything in there, whether there is something in there or not, according to their likes and dislikes.

The Witness: Milk is so essential for growing children that anything that will off-flavor the milk will decrease the consumption. That of itself will act as a factor in increasing illness and retarding growth and so forth. The taste of milk is an important factor and a public health consideration.

Mr. Gariepy: Q. Doctor, do you know of any experience in the use of paper bottles by any of the health officials to show that the amount of offset affects the flavor or the taste of the milk?

A. No.

Q. Have you ever read of any such thing in the reports of milk sanitarians and from commissioners of health concerning experiments, or from bacteriologists, on this?

A. No, sir.

Q. What in your opinion, Doctor, is the largest amount of lead that could get into the milk from the worst job of offsetting, on the inside of the paper container, that you ever saw?

1933 A. I don't know.

Mr. Schaefer: That question has been asked and answered.

Mr. Gariepy: He said he doesn't know.

The Master: It has been answered again, then.

Mr. Gariepy: Q. Why do you say then, Doctor, on direct examination, that this presents a health hazard?

A. Because it is lead, and lead is always a health hazard.

Q. That is just a red flag?

A. Always, yes, sir.

Q. And that is true even though you have no experiments to support your conclusions in here, and there are no statistics on the fact?

A. Yes, sir.

The Master: Q. Can you conceive of a case where enough lead could get into the inside of the container to cause any health hazard?

A. Yes, sir. If that lead was constantly—if it was a young baby and every feeding contained a little lead, I could very readily see that. Lead has an accumulating

action, always. It certainly should not be ignored, and I would consider it a health hazard.

Mr. Gariepy: Q. Doctor, they feed babies ice cream when they get about seven or eight months old, don't 1934 they?

A. At times.

Q. And the ice cream container would have printing and the same type of printing and the same kind of lead that a paper container would have?

A. No.

Q. They use different types of ink?

A. They are made entirely different. They are a nest-style container, and nest-style containers are not offsetters. You cannot offset them. They are not printed in a way to offset.

Q. They are printed flat, aren't they?

A. Yes.

Q. You have seen these flat ice cream containers, with a little wire tab on them, or with a little white cord, haven't you?

A. Yes.

Q. And when they are printed flat, then the occasion for the offset will arise, will it not?

A. No. The print in use there is of a much different type than you use on the milk container. It is a different ink. It does not stand out as well, and it has more dye in it. The decoration and the whole printing of the nest-styling is a different process than that of the milk container.

1935 Q. What about the printing and the quality of the ink that is used on other food containers, such as cheese and butter and so on? Is that a different formula, too?

A. No, I think that they are about the same.

Q. You heard Mr. Taylor testify, from the Hilton-Davis Company here, that they used the same formula as on other products and liquids, didn't you?

A. Yes.

Q. You believe that testimony to be true?

A. Yes.

Mr. Schaefer: I move to strike the last question and answer.

The Master: Yes, it may be stricken as immaterial.

Mr. Gariepy: Q. If this paper milk container, Doctor,

is essentially or substantially sterile, as sterility is known among milk sanitarians, then the lack of paraffin at a particular point is not a public health hazard, is it?

A. Yes.

Q. Why?

A. Because practically sterile does not mean that it is free of bacteria, and it would have disease producing bacteria and still be practically sterile. It either does
1936 not have them or it does have them, and I would consider it a health hazard.

Q. Have you any experience where you found non-spore forming bacteria from those portions where the paraffin did not completely cover?

A. I have found it in disintegrating that area, yes.

Q. You did?

A. Yes.

Q. When did you do that?

A. In 1938.

Q. What time in 1938?

A. Oh, from May to December.

Q. The fact that you found bacteria in this area or this portion that was not completely paraffined, you say that that presents this health problem, because then there is a liquid bridge between the milk and this portion, and the bacteria will cross over?

A. It is possible, yes.

Q. You did not examine the milk to find out the amount, as I understood you to say this morning?

A. No, sir.

Q. Would not the amount of bactria be important?

A. They grow luxuriantly in milk.

Q. No. Would not the amount of bacteria be important?

A. No.

Q. One bacteria or one colony would be sufficient?

A. One typhoid bacteria can cause a case of typhoid fever, if it gets into the milk.

1937 Q. Did you ever find any typhoid bacteria on any paper container board?

A. No.

Q. At any time?

A. No, sir.

Q. Now, this point you brought out, Doctor, concerning milk exerting pressure on the cap—you remember that?

A. Yes.

Q. Would there not be considerable pressure on the cap if the bottle of milk were turned upside down?

A. Yes.

Q. And how would that pressure differ, if any, from the fact that the milk is turned upside down in the paper container?

A. The area is so small. That would be one factor.

The Master: Q. The area is so small in what?

A. If the milk bottle is turned upside down and the milk presses against the cap.

Q. In the glass bottle?

A. Yes. The paper cap is a very small area, as compared to one that is all milk. A milk bottle is not upside down very much or very long.

Mr. Gariepy: Q. Is there any reason to believe that either bottle would be upside down, one more than the other, the paper or glass?

1938 A. I don't think so.

Q. You stated on direct examination concerning the matter of filtered air coming into the plant.

A. Yes.

Q. The paper board plant.

A. Yes.

Q. Do you know anything about the air at the Cherry River Paper Company?

A. No, sir, I do not.

Q. Would you expect to find air with considerable bacteria in it in that mountainous country?

A. Yes, sir.

Q. You would?

A. Yes, sir.

Q. You never were there?

A. No.

Q. What kind of bacteria would you expect to find in the air coming through at the Cherry River Paper Company mill here at Richmond?

A. I can only speak from experience. I have not been there. But I have had experience in bacterial work in mountain atmosphere. I worked with Professor Zunts at Brussels. I went with Professor Zunts on an expedition to Switzerland, where he was studying certain factors of the air in various altitudes. I was studying the bacteria of the air in those altitudes, and I know it does not differ

much from the bacteria in the air at sea level altitude.
1939 It depends upon the wind and how it whips up bacteria from the soil, from the mountain sides. There may be even more bacteria on a windy mountain side than you find on a plain, where there is less violent wind.

Q. Would you expect to find that same problem with regard to the health hazard in the event that a dairy bottling milk in glass was located in the mountains?

A. Surely.

Q. The same thing?

A. Yes.

Q. There would not be any difference?

A. No.

Q. There wouldn't be any difference?

A. No.

Q. Do these dairies have filters that filter the air in there?

A. No.

Q. Then the air comes through the door and goes over the top of the bottles and over the washing and the rest of it without being filtered?

A. It is not blown through under pressure, as it is in the cooling and artificial ventilation in the other case. There you have a tremendous pressure blowing the air in, to bring out the humidified air, to dry the sheet. It is part of the drying of the sheet of paper being formed.

Q. This bacteria would be expected to be coming in on dust, wouldn't it?

A. Yes.

1940 Q. And this dust would appear on the surface of the paper board, wouldn't it?

A. If it were dust, yes.

Q. Did you ever observe any such condition in Detroit at the Risdon Dairy?

A. I did not examine it from that viewpoint, no.

The Master: I would like to ask a question there that occurs to me.

Q. In the case of the caps of ordinary glass milk bottles, I notice when the cap is taken out of the bottle there is a film of cream attached to the underside of it?

A. Yes.

Q. Does that make any difference in connection with the traveling of bacteria?

A. I don't know, Master. I don't know what influence that would have.

Q. Would you say that bacteria on the inner wall or on the inside of the wall of a paper carton get into the body of the milk or just remain along the sides of the container, where the milk happens to be touching the walls of the container?

A. You mean the bacteria are beneath the paraffin, in the paraffin, or on top of the paraffin?

1941 Q. What I have in mind is this. When you pour milk out, there is a thin film of milk which adheres to the sides of the bottle?

A. Yes.

Q. Now, do the bacteria travel beyond the point where the milk is touching the walls of the container, or do the bacteria go right on into the middle of the milk?

A. Right on into the middle of the milk. They are disseminated.

Q. They do not just stop?

A. Oh no.

Mr. Gariepy: Doctor, we were discussing this morning this matter of bacteria and disease emanating or being traced to glass bottles. Are you acquainted with the article by Armstrong and Parran, published in United States Public Health Service Bulletin in 1927, regarding outbreaks of disease being traced to glass milk bottles?

A. No, sir. I do not recall that article.

Q. Do you know those men?

A. What are the initials?

Q. Armstrong and R. Parran.

The Master: What are Armstrong's initials?

Mr. Gariepy: I haven't got his initials, but it is Thomas Parran instead of R.

1942 Q. Do you know Thomas Parran?

A. Oh, he is the present surgeon general.

Q. Yes.

A. And I think I know Armstrong, too. He is the bacteriologist in the—

Q. But you don't know about this article?

A. I do not recall the article, no, sir.

Q. Doctor, how much lead would be necessary to be taken in daily through milk by a child, what quantity, to present a health problem there?

A. I could not answer that offhand.

Q. Now, with regard to the respiratory secretions that you mentioned upon the paper board, you said they did not dry. Do I understand you to mean that they do not dry out at all?

A. Oh, they dry out, but very slowly.

Q. That is it.

A. Yes, sir.

Q. They still die out, don't they?

A. In time, yes, sir.

Q. Did you ever make any tests on paper board concerning these secretions?

A. No, sir.

Q. Did you ever see any employees in a paper milk bottle plant giving off nasal discharge or coughing upon the containers?

A. I do not recall having seen it, no, sir.

1943 Q. That same health hazard is present in a glass bottle plant, is it not?

A. Yes, sir.

Q. And both possibilities or probabilities depend upon the number of employees?

A. No.

Q. The more people employed about, the more opportunity or chance for these secretions to exist?

A. That would be a factor, yes.

Q. This ink offset, Doctor, can you not determine that ink offset at the dairy itself, when the inspector goes there and looks after the paper board and the material that they are using to contain the milk?

A. Oh, there are so many different types of containers. Some of them are paraffined and completely fabricated and I do not see how you could possibly reach one in a machine going 130 or 140 fillings a minute. I don't see how you could expect them to see that there are any offsets.

Q. There is not any reason why an inspector going into a paper bottling plant cannot pick up the blanks as the operator is standing at the machine, and look at them from time to time, and see the amount of offset, and criticise it, is there?

A. No. The offset will not be uniform. Offset

1944 is an accident.

Q. My question is whether an inspector could not see or observe such a condition?

A. No.

Q. Why?

A. Because there are two milk bottles in common use that are fabricated and paraffined in the plant. You cannot see the offset in those.

Q. You can secure containers from time to time, if you want to inspect them. Samples are sent to Dr. Prucha here and Dr. Orvis in Evanston; you could do that and inspect them, couldn't you?

A. You could inspect those, yes, but you wouldn't know what the next bottle would be.

Q. And you could secure any amount on request, telling them you wanted to inspect their containers, from time to time?

A. And they could send you any containers they desired you to inspect.

Q. Is there any reason why the inspector could not go to the plant and say, "I want to look at the containers here. These containers have too much offset."?

A. No.

Q. There is no reason why they could not do it?

A. No.

Q. And if they thought that amount of offset
1945 might poison children, they could make that complaint, couldn't they?

A. Yes.

Q. And they could stop the offset just as they could stop a dairy whose bacteria count was too high?

A. Yes.

Q. Do you consider these public health officials of cities that use single service containers, for instance, Philadelphia and New York City and San Francisco, possessed of sufficient bacteriological control over the paper milk bottle to protect public health in those cities?

Mr. Schaefer: That is objected to.

Mr. Gariepy: He is a public health expert, Master.

The Master: Q. Have you studied it?

A. Sir?

Q. Have you studied the situations there?

A. No, I am not familiar with the bottles they use, or the conditions or anything about it.

Mr. Gariepy: Q. You don't know whether they have control or not?

A. No, I do not.

Q. If I told you that no disease has emanated or even been traced to the single service container in the cities that have been using them for the past several years, would you say that had sufficient bacteriological con-
1946 trol over the container?

A. No, I would not.

Q. Why?

A. Because I do not think you know whether there has been any disease transmitted by a single service container.

Q. Can't they trace that, as well as they can trace it to the glass bottle?

A. No.

Q. They cannot do it?

A. No.

Q. Why not?

A. Because the single service containers are not uniform.

Q. Are the bottles uniform?

A. Much more uniform.

Q. But they are not uniform?

A. No, they are not uniform, but they are under your inspection and you can wash them and clean them to suit yourself. If they are not cleaned and properly disinfected, then the enforcing officer is to blame.

The Master: Q. You are talking about glass bottles?

A. I am talking about glass bottles, yes. On the paper bottle, he has not any control over it.

Mr. Gariepy: Q. He has the rinse test, hasn't he?

A. Yes.

Q. And that is the only test you have on the glass, outside of the inspection?

A. The glass is impermeable.

1947 Q. And you have the disintegration test on the board, which you yourself said this morning you performed?

A. Yes, and I will give you the information on that particular container, and the sample used from that particular container, but it will differ from one container to another, and it will even differ in the same container.

Q. As I understood your direct examination, one of the advantages of the use of the single service container that you recommended to Dr. Bundesen was its use in hospitals?

A. Yes.

Q. Do I understand you to say that even though it has an advantage by being in the hospital, that you would recommend it, even though you do not have control to detect the quality of the board and the sanitary aspects of the container?

A. When I made that recommendation, I did not know the container was porous. I was not aware of that fact.

The Master: Q. That is the only thing?

A. That is the principal thing, Master.

Mr. Gariepy: Q. You said on direct examination, in answer to Mr. Schaefer's question, that all of the dairy equipment, in your opinion, from a public health standpoint, had to be of smooth, impervious surfaces, is
1948 that right?

A. For Grade A milk, yes.

Q. And that is because of the fact that it is being used over and over again, and you want to keep the surfaces clean?

A. Yes.

Q. That does not apply to a single service paper milk bottle then, does it?

A. Yes. We should be able to clean it, or else it should be sterile, or we should be able to disinfect it and convince ourselves that it was clean and harmless.

Q. What would convince you, Doctor?

A. An impermeable surface that I could clean in a dairy, like they clean glass.

Q. Then it would have to be made out of glass; that would be the only thing?

A. No.

Q. What would it be made out of, if it was not made out of glass?

A. It would be made of impermeable material, instead of paraffin.

Q. Name it.

A. Artificial resin.

Q. Do you know of any milk bottles that are being made today out of artificial resin?

A. No. There are caps being made out of it.

1949 Q. Bottles being made out of it?

A. No, no bottles.

Q. Doctor, you testified that you compiled or just assembled this material of George Scott's or of Ex-Cell-O, and you did that just to make out a preliminary report.

Why did you go to Geneva to get an additional check on the paper board from Breed & Sanborn, if you were just going to compile this material?

A. I wanted the material up to date. I wanted to get all the information I could from those two men about the board.

Q. Is that the same reason why you went to the Risdon Dairy, then, to get it up to date?

A. Yes, I wanted to have some first-hand information. I have never seen the Pure-Pak container.

Q. Then it was not just to compile the stuff, but it was to get the last word there was concerning the sanitary aspects and the public health aspects of the single service container in actual operation at the Risdon Dairy, is that it?

A. Yes, from my observation, yes.

Q. And at the Ex-Cell-O Machine Company's plant, where you saw it in operation?

A. Yes.

1950 Q. And the quality of the board as it was actually advanced and used in every day practice in the making of paper milk bottles at Geneva?

A. Yes, sir.

Q. That is right?

A. Yes, sir.

The Master: Q. You say that paraffin is not impermeable?

A. The paraffin container cannot be made impermeable by treating with paraffin.

Q. That is, the bacteria can go through the paraffin coating?

A. Yes, sir. The milk can go through the coating into the board and the bacteria can come from within the board or on the board into the milk.

Mr. Gariepy: Q. Doctor, you testified on cross-examination concerning certain paper containers that were sent to you by Ex-Cell-O or George Scott. Which one sent them, the company or George Scott personally?

A. I do not recall.

Q. And how many did he send you, in 1938?

A. There were one or two packages. I think they either had six or twelve complete empty sealed containers to the package. They came to my home, at 5844 Stony Island.

Q. What month was that, Doctor, if you can remember?

A. I do not remember. It was early in 1938, I think.

Q. How did you happen to get these containers
1951 early in 1938, when you were through making this report, Plaintiff's Exhibit 4 here?

A. I don't remember. I did not know what they were for. They sat around for a month at home before I opened them.

Q. You did not have any communication from him?

A. No, sir.

Q. That he was sending them, or you requested them?

A. No, I did not have any communication from him at all.

Q. Was that before February 7, 1938? Early in the year, I think you said.

A. It was early in the year, yes. I don't know whether it was that time or not. It was early in the year, within the first three months. Now, I do not know the date.

Mr. Gariepy: Mr. Golding, will you mark this Exhibit 87 for identification?

(The document referred to was thereupon marked by the reporter Plaintiff's Exhibit 87 for identification.)

Mr. Gariepy: Q. Doctor, will you look at Plaintiff's Exhibit 87 and see if it will help to refresh your memory as to when you got these containers?

A. No, sir, it does not.

Q. That is your letter to George D. Scott?

1952 A. Yes.

Q. Dated February 7, 1938?

A. Yes, sir.

Q. But whether it was that month or three months afterwards, you cannot tell?

A. I do not associate that with the letter at all, sir.

Q. Why did you request George D. Scott to return this report to you, Doctor?

A. I didn't have a copy. I haven't got a copy of it at all. I did not have a copy. I returned it to him and there was no copy available.

The Master: Q. How many did you prepare originally?

A. One copy.

Q. Didn't you leave one with Dr. Bundesen?

A. I gave the original copy to Dr. Bundesen.

Q. And then the copy you gave to Mr. Scott?

A. Mr. Scott did not have a copy. I only made one copy, and that I gave to Dr. Bundesen.

Q. You mean you made an original and a copy, or just an original?

A. Just an original, with no carbons at all.

Q. And you gave that to Dr. Bundesen?

A. I gave that to Dr. Bundesen.

Q. And he returned it to you?

A. I got it from Dr. Bundesen for Mr. Scott to take to Washington, to see Dr. Parran, and I had requested
1953 Mr. Scott to return it in that letter.

Mr. Gariepy: Q. Was this date, February 7th, 1938, subsequent to your appointment to membership on the Board of Health, or before?

A. No, I was appointed in December 1938.

Q. Two months later?

Mr. Schaefer: Oh no.

The Witness: A. December. That is in February.

Mr. Gariepy: Q. December. This was ten months previous to that?

A. Yes.

Q. Why did you ask him to return the report, Doctor, for which report he paid you $250 to prepare?

A. It was addressed to Dr. Bundesen. I wanted to give it back to Dr. Bundesen. I asked Dr. Bundesen if I could not take it. I should have made a copy of it then, but I did not.

Q. Don't you know how it got back to George D. Scott's possession?

A. I gave it to him.

Q. You gave it to him?

A. Yes, I gave it to him to take to Washington to show to Dr. Tom Parran.

Q. Did you, on February 7, 1938, believe this report to be a true and honest representation concerning the merits of the single service container?

A. Yes.

1954 Q. The purpose of seeing Breed & Sanborn and Dr. Vaughn and the Risdon Dairies there was to bring yourself up to date, that is right, is it not?

A. To bring me up to date. I know nothing about the Pure-Pak container. It was not to bring me up to date. It was getting some original first-hand information.

Q. What have you done with regard to seeing other public health officials of cities and villages and bacteriologists in these cities and villages using the single service container, since that time?

A. I have not seen them at all.

Q. Would you consider the same rule of conduct to be necessary and the same type of investigation to be necessary to bring you up to date on the thing now?

A. No, I don't think so. I have more information on it now.

Q. That is what you got, you testified to, in the spring of 1938?

A. Yes, sir.

Q. Have you read the articles published by Dr. Prucha and Dr. Paul Tracy concerning the sanitary aspects of the milk bottle?

A. I think I have read all of their publications.

Q. Do you consider those articles as accurately representing the merits of said container?

1955 Mr. Schaefer: Now, that is objected to.

Mr. Gariepy: He is a public health official.

The Master: Are they in evidence?

Mr. Gariepy: Yes. Mr. Schaefer brought out two of Dr. Prucha's reports, one at Louisville and one at another place.

Mr. Schaefer: I don't believe they are in evidence.

Mr. Gariepy: I think you offered them both.

Mr. Schaefer: I think not.

Mr. Gariepy: Q. Well, you read them, did you, Doctor?

A. Yes, sir.

Q. And you are acquainted with the contents of them?

A. Yes.

Q. Do you think they accurately represent the merits, from a public health standpoint, of the single service container?

A. No.

Mr. Schaefer: That is objected to.

Mr. Gariepy: Q. They do not?

A. No.

The Master: He says no.

Mr. Gariepy: Q. Wherein are they false and misleading?

The Master: I think those documents, not being in evidence, do not afford much help to the Court, in determining just what this witness is talking about. That is all a matter of argument. We have all of the

1956 evidence in the record now on both sides and you are just going to go over the whole thing again. I don't know whether it is going to do any good here to question

this witness in what respects he disagrees with those articles. We have the respective contentions in the record now.

Mr. Gariepy: I am just asking what his opinion is as a public health expert.

The Master: He has already testified or he has already told you that he does not agree with it, and now you are going to have him repeat everything he has said up to today.

Mr. Gariepy: No, I don't want him to repeat. I just want to know whether they are false and misleading.

The Master: No, it is just going over the whole thing again. I will sustain the objection.

Mr. Gariepy: Q. Doctor, let us get back to this matter of spicules of paraffin that you mentioned. You mean by spicules, needle-pointed objects, is that correct?

A. Yes.

Q. And that is Webster's dictionary definition of a spicule, is it not?

A. Yes.

Q. When milk is fed to infants, I understood you to say it is generally heated?

1957 A. According to the age of the child.

Q. For the child under one year?

A. Usually, yes.

Q. Would not the needle-point character of this particle of paraffin, this spicule character of it, the melted away?

A. Yes, sir.

Q. Then the dangers from the spicule would be removed by the heating process?

A. It would still be a piece of paraffin.

Q. But it would be removed in the heating process; it would be melted down, dissolved, isn't that so?

The Master: He said that the paraffin would still be there, although the point might not be.

Mr. Gariepy: Q. And that spicule character being dissolved away, the degree of irritation that you said would exist from it getting into the intestinal tract would be lessened somewhat, wouldn't it?

A. I don't think so, no.

Q. It would be just as much as though the spicule was a round particle?

A. In the intestinal tract it would not be as hard as it is outside, in the air, and I do not think it would have the

hazard of puncturing the intestinal tract, but it would be a foreign body in the intestinal tract.

1958 Q. You know that mineral oils are used in the intestinal tract, don't you, and prescribed by physicians?

A. At times, yes, and under certain conditions.

Q. Do any of these mineral oils contain any of the component parts of paraffin?

A. They contain very similar products to paraffin.

Q. The mineral oils are suggested because of the fact they are easier on the intestinal tract, and cause less wear and tear, is that right?

A. No, I wouldn't say that.

Q. Why?

A. Because that isn't true. You give mineral oils for a certain purpose. You use several types of cathartics. Mineral oil is one of them. It depends on what you want done. It depends on the patient, the disease, the age, as to what you want to do.

Q. Is not mineral oil prescribed after operations at a hospital, say, at the Cook County Hospital here?

A. I suppose it is, at times.

Q. Do you know that as a fact?

A. No, I do not know that as a fact.

Q. Would you be surprised if I told you so?

A. No, I would not.

The Master: Q. Do they give mineral oil to children under one year of age?

A. At times, yes. If they are constipated.

1959 Mr. Gariepy: Q. Will you point out to the Master with a piece of paper and a pencil how big a milligram of the spicule of that paraffin would be, Doctor?

A. It would depend on the thickness of it.

Q. What size thickness did you have in mind when you testified on direct that it might be injurious to infants, in the intestinal tract, or to a senile person?

A. I would say a mass containing several milligrams of paraffin. It would be, I suppose—

The Master: Q. The size of a pinhead?

A. Oh, I suppose half as big as a pea, something of that kind. It varies, though, in size and in shape.

Mr. Gariepy: Q. Now, with regard to babies' milk, Doctor, is it not a fact that evaporated milk is most commonly used in feeding babies?

A. It is commonly used.

Q. And in that evaporated milk there is none of this health hazard of spicules of paraffin, is there?

A. I should not think so.

Q. Now, Doctor, did you, in any of your observations ever see any harmful amount of bacteria in the felts in a paper mill?

A. You mean harmful?

Q. Yes.

A. Yes.

1960 Q. Where?

A. At Sealrite. A large number of bacteria are suspicious, any time you see a large number. There was no disease producing bacteria detected, but there was a high bacterial flora in the felts.

Q. Is this Fulton plant of Sealrite located in the city or in the country?

A. It is located in Fulton, New York.

Q. Is that a small suburb or a highly intensified industrial district?

A. It is a highly intensified industrial district, of, I would say, twenty-five to fifty thousand people.

Q. Did you observe the quality of air that came through the factory there where they are making these containers?

A. Yes.

Q. What quality of air is there?

A. It is just ordinary air, that will bear bacteria, depending upon the wind and meteorological conditions.

Q. Is that filtered air in there?

A. They are filtering it, yes. They began filtering it a few months ago.

Q. Is it not a fact that most of these paper mills are located in the country and out of city districts, so that they can be near their source of raw material?

1961 A. I am not familiar with that.

Q. You don't know?

A. No.

Q. Doctor, this milk that babies take, under one year, cow's milk, not evaporated milk, is usually fed to the baby in a bottle, is it not?

A. Yes, sir.

Q. And the bottle has a nipple on it?

A. Yes, sir.

Q. Is the spicule big enough to go through the hole of that nipple?

A. I think it would be. It could be, yes. It could be too large to go through or it could be small enough to go through.

Q. If it is too large to go through, when she takes off the nipple through the nursing hour, she shakes the bottle out and sterilizes it in the kitchen, as they usually do, dumps it outside and out goes the spicule?

A. Yes.

Mr. Gariepy: That is all.

Mr. Schaefer: One or two questions.

1962 *Redirect Examination by Mr. Schaefer.*

Q. With respect to Dr. Prucha's experiments concerning the self-purification of paper, I understand that you do not question the result of Dr. Prucha's work, but you question the interpretation of that result, is that correct?

A. Yes, sir.

Q. You testified that you advised Dr. Bundesen of the fact that the work which you have done subsequent to the preparation of Plaintiff's Exhibit 4 had caused you to conclude that the paraffin paper container was not satisfactory from a public health point of view. Did you advise anyone else of that fact?

A. Yes, I did.

Q. Who did you advise?

A. I advised Mr. Skinner, the president of Sealrite.

Q. Who else?

A. I advised Mr. Scott, of Ex-Cell-O.

Q. When did you advise Mr. Scott of the Ex-Cell-O Corporation?

A. I think it was in October 1938.

Mr. Schaefer: That is all, Doctor.

1963 *Recross Examination by Mr. Gariepy:*

Q. Doctor, Mr. Schaefer asked you about Dr. Prucha's experiment on the self-purification of paper?

A. Yes, sir.

Q. I show you Plaintiff's Exhibit 46, which purports to be the exhibit dealing with that subject. Those tests, in your opinion, are accurate, are they?

A. Yes, sir.

Q. What interpretation do you place on those tests?

A. I place this interpretation on these tests: After he dipped the plaque, which was two and a half by four and one-half inches, into his bacterial suspension of B-prodigiosis of this concentration, and immediately disintegrated it, he had a seeding on the plaque on the average of 14,000 bacteria. After thirty minutes of repeating that technique and allowing it to dry for thirty minutes, he had 450 bacteria. After sixty minutes and on to twenty-four hours he had fewer bacteria, and in sixty minutes three and two hours zero, and on down. I interpret that at this point—

Mr. Schaefer: What point?

A. At the point of inoculation or immediately after the plaques were dipped into the bacteria suspension, disintegrated, he had moisture on the surface.

1964 Mr. Gariepy: Q. Referring to what?

A. Column 1. He had moisture on the surface, with bacteria on. After thirty minutes there had been sufficient absorption into the paper board and particularly into the edges of the board that are not calendered, as well as through the calendering—there is ten times the rapidity of absorption through the uncalendered edge as there is through the dense, hard shell of the calendered surface. At the end of sixty minutes the fibers had absorbed all the water, and there was nothing definite on the surface for the bacteria.

These bacteria B-prodigiosis, are used very frequently by bacteriologists, because they form red colonies, and you can detect them without much technical difficulty. They will grow rapidly day after day in this artificial medium in the laboratory. They are in a very susceptible state. They have been cultured under ideal conditions and they react more violently to adverse physical chemical conditions than with hardier bacteria that had to survive pus, feces, and so on and so forth.

I think from those two standpoints, lack of hardiness of the organisms, but mainly due to the dehydration of
1965 the bacteria, by the water hunger of the cellulose fibers in the board, that that explains the results.

Mr. Gariepy: Q. Doctor, is it not a fact that the wetter the board the more the dehydrating process?

A. No.

Q. No.

A. No. Dehydration from the surface into the board means a water hunger or a deficit of water in the board.

If you have plenty of water in the board, it will not take water from the surface.

Mr. Gariepy: That is all, Doctor.

The Witness: Is that all?

Mr. Schaefer: That is all, sir.

The Master: I want to ask a question along that line.

Q. For instance, there is water inside the board. Isn't that going to dry out some way?

A. No, sir. It is hard to dry it out, because the atmosphere contains more water than is contained in the board, so the board tends to take up water, instead of giving it out. The fibers have a tremendous water hunger.

Q. Then I understand you to say that if there is water once inside the board, it stays there?

A. Yes, sir. If you make board with 8 per cent or 9 per cent water, it will hold that amount of water. It will
1966 not reduce it down to 5. The whole drying operation, which is the most expensive in the paper mill, is for the purpose of getting rid of water artificially, by heat and pressure, to dehydrate the board.

Q. Then you would say after it has been dehydrated down to about 9 per cent, it does not dehydrate after that, when it gets into ordinary room temperature?

A. No. It will tend the opposite way. It will tend to pick it up.

Q. Then you say there is no self-drying of the board?

A. No. It has too great a water hunger.

Mr. Gariepy: Q. Is that just a fiction or pet phrase, would you say, of Dr. Prucha's, or is it just unheard of?

A. What?

Q. This self-drying paper board?

A. No. Simply a different terminology. Dr. Prucha, I understood, calls it self-disinfection.

Q. Self-purification of paper board?

A. Yes.

Q. There is no such thing that you know of, is that right?

A. I wouldn't call it that. I would call it the dehydration of bacteria on the surface, due to water absorption onto the board.

Q. But the water does not purify itself, in time?

1967 A. I don't think it does in that sense, at all.

Q. In what sense does it dry itself?

A. Any bacteria placed on the surface, under ordinary

conditions are placed on the surface suspended in something, in contact with something. Now, it is simply a matter of how tenacious that medium is as compared to the water hunger of the board. In time I think the bacteria will disappear from the surface.

The Master: Q. The bacteria will disappear from the surface?

A. But it would take weeks and months, as compared with the minutes in Dr. Prucha's experiments.

Mr. Gariepy: Q. And your experiments showed it took many weeks or months?

A. I did not test it through.

Mr. Gariepy: That is all, Doctor.

(Witness excused.)

Mr. Schaefer: Mr. Golding, will you mark these Defendants' Exhibits 24, 25, 26 and 27?

(The documents referred to were thereupon marked by the reporter Defendants' Exhibits 24, 25, 26 and 27, respectively, for identification.)

Mr. Schaefer: If the Master please, I now offer in 1968 evidence Defendants' Exhibit 24 for identification, which is a copy of the ordinance and regulations of the City of Chicago and of the Board of Health of the city, pertaining to the production, processing and distribution of milk and milk products.

I also offer Defendants' Exhibit 25, which is a copy of a regulation adopted by the Board of Health on August 6, 1935, concerning the type of milk and cream to be used in the manufacture of butter to be sold in the City of Chicago, and, in substance, requires that the butter be made from cream coming from tuberculin tested cows.

I also offer Defendants' Exhibit 26, which is a copy of a regulation adopted by the Board of Health on November 12, 1935, which is the one to which I alluded previously, requiring that all milk and milk products be served and dispensed to the final consumer only in the original unopened container, as received from the distributor.

I also offer Defendants' Exhibit 27, which is a copy of a resolution adopted by the Board of Health or published by the Board of Health on July 18, 1939, pertaining to the use of the standard nutrient agar prescribed in the sixth edition of the American Public Health Association 1969 Standard Methods of Milk Analysis.

The Master: They may be received.

(Said documents, as above described, so offered and received in evidence, were marked DEFENDANTS' EXHIBITS 24, 25, 26 and 27, and are attached hereto and made a part hereof.)

The Master: Anything further?

Mr. Schaefer: Off the record, please.

(Discussion off the record.)

Mr. Schaefer: If the Master please, I offer in evidence as Defendants' Exhibit 28, a stipulation regarding certain tests to be performed in connection with this case and a copy of the procedures to be employed in following those tests, the original of which is on file in the files of this case, filed June 29, 1939.

The Master: It may be received.

(Said stipulation so offered and received in evidence was marked DEFENDANTS' EXHIBIT 28, and is attached hereto and made a part hereof.)

Mr. Schaefer: Now, if the Master please, I believe there are some of the Defendants' Exhibits which may not have been offered. I have not had an opportunity to check that. I would like now to reoffer all of the Defendants' Exhibits numbering from 1 to 28.

1970 Mr. Gariepy: That puts us on the spot.

The Master: Off the record.

(Discussion off the record.)

The Master: Outside of that do you rest?

Mr. Schaefer: Outside of the fact that I have not yet checked over the exhibits or the record with regard to the exhibits, and outside of the fact that I have not yet prepared objections to the depositions, we rest, yes, sir. I would like to have time to do that checking, however.

The Master: Let the record show that this hearing is adjourned to 2 o'clock P. M. on October 19th.

Whereupon the hearing of the above entitled cause was continued to 2 o'clock P. M. Thursday, October 19, 1939.

1971 • • (Caption) • •

Monday, October 23, 1939,
2:00 o'clock p. m.

Met, pursuant to adjournment.

Present:

Mr. Gariepy, Mr. Rall, on behalf of plaintiff.
Mr. Schaefer, Mr. Horan, on behalf of defendants.

1972 The Master: You may proceed.

Mr. Schaefer: I am calling Doctor Bundesen.

Mr. Gariepy: If the Master please, if the reports concerning the nature of this hearing are correct, I now move that the other witnesses, other than the witness who is about to testify, be excluded, and I am referring to other members of the Board of Health of the City of Chicago, and that they be called in the order that they are testifying.

Mr. Schaefer: I have no objection to that, but I do not see the others here.

Mr. Gariepy: Is Doctor Dulak here?

Mr. Horan: No, not in the room.

Mr. Gariepy: They are all in the other room, I understand. All right, thank you.

HERMAN N. BUNDESEN, was called as a witness on behalf of the defendants, having been first duly sworn, testified as follows:

Direct Examination by Mr. Schaefer.

Q. Will you state your name, please, Doctor?

A. Bundesen, B-u-n-d-e-s-e-n, Herman Bundesen.

Q. And where do you live, Doctor?

A. 7410 Oglesby avenue, Chicago.

1973 Q. And your occupation?

A. President of the Chicago Board of Health.

Q. How long have you been president of the Board of Health of the City of Chicago?

A. I was first appointed February 1st, 1922, and then served until November, 1927, and then I was again reappointed in March of 1931, up to the present time. How-

ever, during the early years I was Commissioner of Health, and then the Supreme Court ruled that the job of Commissioner of Health was illegal, in the 302nd Illinois, and then the position of president of the Board of Health was created, and I have been president only since the latter part of 1926, I think it is, or 1925.

Q. During the entire period you have been in charge in one capacity or other, of the administrative and technical departments of the Board of Health of the City of Chicago?

A. Since the Board of Health was appointed, under the direction of the Board of Health, yes, sir.

Q. Now, doctor, during the time that you have been president of the Board of Health of the City of Chicago have you had occasion to consider the question of the use of paper containers for the distribution of fresh fluid milk in the city?

1974 A. Application has come before me for permission to use paper containers, yes.

Q. Do you remember when that was, doctor?

A. No, I would not. The records in the Health Department would show all that. It is quite some years ago. I would not know just how long ago that would be. With so many activities I cannot remember.

Q. Since the time when the application was first made have you devoted any time to the consideration of the public health problems, if any, involved in the use of paper containers for the distribution of fresh fluid milk?

A. Well, personally I have not devoted much time to the technical details, but I have referred to the various technical people in the department the matters regarding paper containers and have referred to them the applications and have looked to them for the looking up of the records and making what necessary investigation there was regarding the use of paper containers.

Q. Doctor, in your opinion, is the kind of material used in the manufacture of paper containers a matter of public health significance?

A. Yes, I think it is.

Q. And in your opinion is the kind of board used in a paper mill manufacturing paper board for use in milk

1975 containers of any public health significance?

A. Yes, I think it might be.

Q. And in your opinion, doctor, are the sanitary conditions in a plant where paper board is cut, formed and

printed for use in paper milk containers matters of public health significance?

A. Yes, I think they would be.

Q. In your opinion is the bactericidal effect, if any, of the application of paraffin to paper used in paper milk containers a matter of public health significance?

A. I don't know enough about the technical subject to qualify as an expert on that. I would have to take the advice of our technical men, as I have in the past, on the Board of Health.

Q. In your opinion is the fact that paraffined paper milk containers are uniformly absorbent a matter of public health significance?

A. I do not know that they are uniformly absorbent, and if they were uniformly absorbent—

Q. Assuming they are uniformly absorbent, Doctor, in your opinion is that a matter of public health significance?

A. Yes, it might be.

Q. Will you assume, Doctor, for the purpose of this next question, that undissolved paraffin from paper con-
1976 tainers gets into the milk placed in those containers, in quantities varying from one milligram per quart to as high as one hundred and seven milligrams per quart; is that a matter of any public health significance, in your opinion?

A. I would not know the effect of paraffin on the intestinal tract to testify to that as an expert. I know there are many foods that do have paraffin containers and that we do not consider those a health hazard. As to what effect it might have on the intestinal tract, if you are referring to children, a pediatrician would have to testify to that. I would not be able to give the answer on that. I don't know enough about the effect of paraffin, except that in adults I know of no harm that paraffin would do if an adult swallowed some paraffin, if he did not have any pathological condition in the intestinal tract. That is really a medical matter that I would not be competent to answer you intelligently on.

Q. Now, Doctor, as of February 2, 1939, what opinion, if any, did you have as to whether or not, from the point of view of public health, the use of paper containers should be permitted for the distribution of fresh fluid milk?

A. Well, I think that was answered pretty well by
1977 the Board of Health in a meeting of about May of this year, when the Board of Health went on record

regarding its attitude as to the use of paper containers, when they passed a resolution that it was the sense of the Board that the use of paper containers might be permitted without attendant hazards to the public health when the principles of certain regulations were carried out, and then the Board at that time passed certain definite regulations, and I think that is the attitude that I had, although I was not at that time a member of the Board of Health. Doctor Black was the acting president and I was on a leave of absence. That was the resolution that was presented by Doctor Arnold, I think. I think that is my attitude at the present time.

Mr. Schaefer: Now, if the Master please, I move to strike that answer as not responsive, and I would like to have the question read to Doctor Bundensen.

Mr. Gariepy: I submit that the answer is responsive.

The Master: Let the reporter read the question and also the answer.

(The record was read by the reporter as above recorded.)

Mr. Schaefer: The question deals as of February 2nd.

1978 The Master: February 2nd, yes. I think the answer may be stricken. Now read the question again.

(The question was again read by the reporter.)

Mr. Schaefer: Q. I am asking for your opinion, Doctor.

The Master: Q. At that time did you have any opinion on that question?

A. As to the use of what?

Q. Paper containers.

Mr. Gariepy: Of the single service container.

The Witness: A. My opinion has been consistently the same all the time, that paper containers, if they could be used with safety, I would have no objection to. Does that answer your question?

Mr. Schaefer: Q. What in your opinion are the factors that go to determine whether or not paper containers can be used with safety?

A. Those opinions expressed in the meeting of the Board of Health, which covered that point very well, which have just been read, of this May meeting; that the use of paper containers—

Mr. Schaefer: I will have to move to strike that, Master.

The Master: Yes.

Mr. Schaefer: Doctor, please pay attention to the 1979 question, when it is read.

The Master: Read the question.

(Mr. Schaefer's last question was read by the reporter as above recorded.)

The Witness: A. Those factors that were adopted—those factors as outlined by the requirements of the United States Public Health Service.

Mr. Schaefer: Q. And what are those, doctor?

A. I am not so very familiar with many of them. That the material should be non-porous, that there should be certain bacterial—whether there should be a certain temperature for the heating of the material that goes into the making up of the container.

Q. Any others, doctor?

A. I don't pay much attention to the details of those things. There is a large number of them, but I would not know what they were.

Q. When you say non-porous, with respect to paper containers, Doctor, do you mean non-absorbent?

A. Yes, non-absorbent.

Q. In your opinion should the use of paper containers which are absorbent be permitted for the distribution of fresh fluid milk in the city of Chicago?

A. I would be guided a good deal by the regulations of the United States Public Health Service on that, but 1980 I don't think that the United States Public Health Service permits them to be non-absorbent.

Q. Do you mean that last statement? Will you read that, Mr. Reporter?

The Master: There are two negatives there. Read the answer.

(The witness' last answer was read by the reporter as above recorded.)

The Witness: I do not think that the United States Public Health Service standards permit a container which is absorbent.

Mr. Schaefer: Mr. Golding, mark this Defendant's Exhibit 29 for identification, please.

(The document referred to was thereupon marked by the reporter Defendant's Exhibit 29, for identification.)

Mr. Schaefer: Q. Doctor, I show you a document which has been marked Defendants' Exhibit 29, for identification, which purports to be a resolution adopted by the Board of

Health of the City of Chicago. Will you examine that document and tell me what it is, please?

A. That is a resolution presented by me to the Board of Health, which makes the ordinance of the City of Chicago conform to the Government's ordinance.

1981 Q. I would suggest that you do not state what it does. That is really a matter for the lawyers to determine.

Mr. Gariepy: I suggest, counsel, that the document speaks for itself.

Mr. Schaefer: Q. Is that a resolution or a copy of a resolution which was adopted by the Board of Health?

A. Yes, sir. That is the resolution that I presented to the Board of Health, and it was adopted by the Board of Health.

Q. And on what date was that?

A. I think it was October 16th. It was last Monday.

Q. Now, attached to the resolution are copies of the suggested changes prepared by the United States Public Health Service, is that correct?

A. Yes, sir.

The Master: Suggested changes in what?

Mr. Schaefer: In the United States Public Health Service standard milk ordinance and code.

The Witness: They are changes in the Chicago code to conform to the United States Public Health Service code.

Mr. Schaefer: Q. Doctor, will you examine that document, the last six pages of that document, and tell me wherein the suggestions there made differ from the

1982 suggestions made by the United States Public Health Service Advisory Board in June of 1939, if at all?

A: I am not familiar enough to testify wherein they differ with the suggestions made by the Advisory Board, particularly in this Section 10 of the Code. One important point here, and, as I read it at the time, the one that changed it, to live up to our ordinance, is this statement in which it says "Milk and milk products sold and distributed in containers in quantities of less than one gallon shall be delivered in standard milk bottles," which is in the old ordinance, and this is in the new ordinance now; "Or in single service containers."

Q. Yes.

A. That is in this one here, "in single service containers."

Q. Yes.

A. Then—

Mr. Schaefer: Is there a question pending, Mr. Reporter?

Mr. Gariepy: He is answering your question.

Mr. Schaefer: Will you read my question?

(Mr. Schaefer's last question was read as follows: "Doctor, will you examine that document, the last six pages of that document, and tell me wherein the sug-
1983 gestions there made differ from the suggestions made by the United States Public Health Service Advisory Board in June of 1939, if at all?")

Mr. Schaefer: Q. Can you point out any particulars in which they differ, doctor?

A. Yes, sir. You mean, where the suggestions or where the recommendations of the Advisory Board differ?

Q. Yes, sir. From that material there.

A. Yes, sir.

The Master: What is the significance of this now?

Mr. Schaefer: I will withdraw that question.

Q. Doctor, at that meeting of the Board of Health on October 16th, 1939, who was present at the time of the presentation of this resolution?

Mr. Gariepy: I am going to object to that. The minutes of the Board of Health meeting at that time by the secretary of the Board are the best evidence of who was there and what took place, and not this doctor's idea about it.

The Master: Does the resolution say who was present?

Mr. Schaefer: No, sir.

Mr. Gariepy: They have got minutes.

The Master: Oh, I will let him state who was
1984 present. That is, the members of the Board.

The Witness: There were others present besides members of the Board.

The Master: Sir?

The Witness: There were others present besides the members of the Board, and the minutes would not show that.

The Master: Q. What members of the Board were present at this meeting?

A. All of the members of the Board. There were Doctor Black, Mr. Harry Reynolds, Doctor Francis Dulak and Doctor Lloyd Arnold, and myself. Those are the five members of the Board.

Q. Who else was present, Doctor?

A. Well, the acting—the man who was acting in the capacity of assistant to the president while the assistant to

the president was not there. That was Mr. Krueger and Mr. Guerin, and a number of newspaper boys. I don't recall whether anybody else was present. There were present during part of the meeting some milk dealers who were called in for certain infractions of the rules.

Q. Were they present at the time this resolution was considered?

A. No, sir.

1985 Q. They were not?

A. No, sir. You mean the newspaper boys, yes, sir. The newspaper boys were, but not the milk dealers that were called in.

Q. Those dairy people were not there?

A. No, sir. As I recall, there was no one else. Oh, yes, the secretary of the meeting, who takes down the minutes of all of these meetings.

Q. Who was that, doctor?

A. Madeline Wisa. I think that is everybody that was present.

Q. Doctor, you omitted one person who was there?

A. Have I? Oh, yes, and a very important person. The Assistant Corporation Counsel, Mr. Horan. I beg your pardon, Mr. Horan. I should not have done that.

Q. Now, doctor, is it the usual practice for the newspaper reporters to attend meetings of the Board?

Mr. Gariepy: I object to that.

The Master: Objection sustained.

Mr. Schaefer: Q. What significance, if any, Doctor, do you attach to the following statement contained in the recently adopted regulations of the United States Public Health Service pertaining to paper milk containers, and I am quoting from their regulations:

1986 "The porous condition of paraffin containers now available and the sloughing of particles of paraffin into the product are undesirable."

A. I think any statements that are made by the United States Public Health Service are of great significance and would have a great weight in influencing me.

Mr. Schaefer: Cross-examine.

Cross-Examination by Mr. Gariepy.

Q. Doctor Bundesen, have you been subpoenaed here today?

A. Yes, sir.

Q. And by whom were you subpoenaed?

Mr. Schaefer: It could be the President of the United States.

Mr. Gariepy: For the record I would like to show this. This is unusual. It comes in after the defendant has closed his case.

The Master: Go ahead and ask the question.

Mr. Gariepy: Q. Who subpoenaed you, Doctor?

A. All I know is that the boy came in and said he was from the Corporation Counsel's office of Chicago.

1987 Mr. Gariepy: Q. The Corporation Counsel is representing all of the defendants, including you and the Board of Health, in this litigation?

A. I don't think I am in this litigation. I don't think I am a part of this litigation.

Q. You are a member of the Board of Health?

A. Yes.

Q. And you are president at this time?

A. Yes,

Q. At the time this lawsuit was filed, on February 2nd, 1939, Doctor Robert Black occupied the office you occupy now as president of the Board of Health?

A. Yes.

Q. And you were on leave of absence at that time?

A. Yes.

Q. And you have supplanted him since?

A. Yes.

Q. And he is still a member of the Board of Health?

A. Yes, sir, as far as I know.

Q. Doctor, who dictates the policies with regard to the public health, of the Chicago Board of Health, in matters taking action to protect public health? Is there anybody that dictates policies or with whom the Board confers before taking any action to protect public health?

1988 Mr. Schaefer: That is objected to.

The Master: Objection sustained.

Mr. Gariepy: Q. Doctor, was the action taken by you and by the members of the Board of Health on October 16th, 1939, a free and voluntary action, that was taken at your suggestion?

A. I could not answer for the other members of the Board of Health. I can answer for myself. As far as I am concerned, it was—you say free and voluntary?

Q. Yes.

A. Yes, it was free and voluntary.

Q. Did you call the other members in to that session of the 16th?

A. I always do, yes, sir. That was a special meeting that we held.

Q. And was this matter of the resolution of October 16th, 1935, which counsel showed to you, discussed with the members of the Board of Health at that time?

A. Oh, yes, sir. You mean before it was passed?

Q. Yes.

A. Yes, sir.

Q. And Doctor Arnold was present at that time?

A. Yes.

Q. And is that the same Doctor Arnold who on May 15th, 1939, offered a resolution to the Board of Health concerning the use of single service containers in the city
1989 of Chicago?

Mr. Schaefer: That is objected to.

Mr. Gariepy: You opened the door on the May 15th meeting.

Mr. Schaefer: No, I did not.

The Master: I will sustain the objection. That was an unresponsive answer which that question adverted to.

Mr. Gariepy: All right, but he went into the actions of the Board of Health.

Q. What other action did the Board of Health take previous to October 16th, 1939 with regard to the recognition of the use of single service containers in the city of Chicago for the sale of fresh fluid milk?

A. Previous to when?

Q. October 16th, 1939. That was last Monday.

A. The Board of Health passed a resolution some time in May, 1939, regarding paper containers.

Q. If I asked you to name the date and suggested the 15th, would you say that was right or wrong?

Mr. Schaefer: That is objected to.

The Master: Is there any question about that?

Mr. Schaefer: I don't know what date that was.

Mr. Gariepy: Do you accept it?

1990 Mr. Schaefer: I don't know when the action was taken or if any action was taken.

Mr. Gariepy: Let us bring in the records then, counsel.

The Master: Let us not have all this colloquy. Proceed.

Mr. Gariepy: Mr. Golding, will you mark this Plaintiff's Exhibit 88?

(The document referred to was thereupon marked by the reporter Plaintiff's Exhibit 88, for identification.)

Mr. Gariepy: Q. Doctor, I show you a four page statement which I have had marked Plaintiff's Exhibit 88, and ask you to look over those four pages before I ask you another question with regard to the contents of those sheets.

A. Yes, sir.

Q. Do you recall the action taken, described in these four sheets, Plaintiff's Exhibit 88, on or about May 15th, 1939, by the Board of Health of the City of Chicago?

A. I was not a member of the Board of Health on May 15th, so I don't know what action was taken, except what I saw afterwards in the minutes of the Board of Health. I was not connected actively with the Board
1991 of Health on May 15th of this year, when that action was taken.

Q. Do you know that the action was taken, as described on Plaintiff's Exhibit 88 here, by the Board of Health, as shown in the minutes, on May 15th?

A. Yes, sir. The records of the Board of Health show that that action was taken.

Q. And was that resolution and that action taken on motion and suggestion of Doctor Lloyd Arnold?

A. The records would have to show that. My understanding is that it was, but I just got that from reading it over. I was not present at the meeting. You would have to consult the records.

Q. What activity or part did Mr. Charles Horan, the Assistant Corporation Counsel, who was present, take in the meeting held on October 16th, 1939?

Mr. Schaefer: That is objected to.

The Master: Sustained.

Mr. Gariepy: Q. Did you take any counsel with Mr. Horan with regard to this resolution that was passed on the 16th, that counsel showed to you, marked Defendants' Exhibit No. 29?

Mr. Schaefer: That is objected to.

The Master: Sustained.

Mr. Gariepy: You opened the door when you ad-
1992 mitted who was present, let him testify who was present, when I objected on the ground that the minutes were the best evidence of who was present.

The Master: I just let him go into who was present, and that is all.

Mr. Gariepy: Q. Did Doctor Lloyd Arnold vote at that meeting on October 16th, 1939?

A. No, he did not.

Q. He did not vote?

A. He did not vote. Each member was polled.

Q. And he was silent?

A. Each member voted yes, except Doctor Arnold, and for the purposes of the record he said he was passing his vote and not voting.

Q. I see.

A. But the president did vote.

Q. Now, counsel asked you concerning the significance of the last sheet of the United States Public Health Service suggestions, that part reading that "The porous condition of paraffin containers now available and the sloughing off of particles of paraffin into the product are undesirable." Have you ever heard of any health problem being created by reason of the sloughing off of particles of paraffin?

A. I don't even know that paraffin sloughts off.

1993 Q. Have you ever heard of any child or any aged person, Doctor, becoming sick or ill in any form, shape or manner with disease, by reason of drinking milk that had paraffin in it?

A. I don't practice medicine, so I would not know.

Q. No, I say, have you ever heard of such a thing occurring?

A. It is not a reportable condition to the Board of Health, so there would be no way that I could find out. Did you mean in the literature or in conversation with people?

Q. That is right. In literature, in articles, by referring to or by talking with other members of the Board of Health, where paper containers are used, have you ever heard of any such thing?

A. I do not recall a case.

Q. Have you ever heard of any baby becoming sick by reason of spicules of paraffin getting into the milk?

A. No. But that does not mean that there might not be something in the literature. I have never heard of it.

Q. You have never heard of it?

A. No, sir.

Q. Now, you said that you turned over a lot of this

1994 technical work in the matter of the single service container inquiry to others in the department. Who in the department did you refer to, Doctor?

A. Well, essentially Mr. Krueger, who is the chief sanitary officer in charge of all the milk activities, and Mr. Guerin, who is the Chief of the Bureau of Dairy Products of the City of Chicago. They are the two technical men who handle the matters of milk essentially.

Q. After you referred back to them concerning this application for the use of single service containers in the city, did you ever receive from either of these men a report concerning the advisability or the inadvisability of using these containers?

A. Both of these men were present and aided in the drawing up of this resolution.

Q. Of October 16th, 1939, is that the resolution you refer to?

Mr. Schaefer: I object to that on the ground it is incompetent testimony.

Mr. Gariepy: I will get to that in a minute. You may strike that.

The Master: The answer may be stricken.

Mr. Gariepy: Doctor, will you listen to the question I gave you a minute ago. Read it, Mr. Golding, please.

1995 (Mr. Gariepy's question, referred to, was read as follows: "After you referred back to them concerning this application for the use of single service containers in the city did you ever receive from either of these men a report concerning the advisability or inadvisability of using these containers?")

The Witness: A. Yes, sir.

Mr. Gariepy: Q. When?

A. Just before the resolution of October 16th was drawn up.

Q. In 1939?

A. Yes, sir.

Q. And in what form was that report from Mr. Guerin or Paul F. Kreuger, verbal or writing?

Mr. Schaefer: If the Master please, we are going far afield.

Mr. Gariepy: You opened the door.

The Master: I am just wondering what all this testimony is about.

Mr. Gariepy: I don't know what counsel is attempting to prove here.

The Master: But you sat there and did not object. He brought in a witness who does not profess to be an expert on the subject of bacteriology, and presented that
1996 question. You did not object. You let him introduce the evidence.

Mr. Gariepy: No. He asked him a lot of questions concerning absorption and paraffin.

The Master: And you did not object.

Mr. Gariepy: No. Let him do it. But if he asked him about those things I have a right to cross examine about the testimony he gave on direct.

The Master: I will let him answer whether he received a report.

Q. Was it in writing or orally?

Mr. Gariepy: Q. From Mr. Guerin or Paul Krueger.

A. The substance of it is in the resolution.

Q. Of October 16th, 1939?

A. Yes, sir. We discussed it and wrote up the resolution.

Q. Counsel asked you concerning the absorption of milk in a paper container. Do you know of any paper container that is being used as of this day that does not prevent any absorption of milk?

Mr. Schaefer: Does not what?

Mr. Gariepy: Q. Does not permit any absorption of milk.

A. I know nothing of the merits of any container at the present time, personally.

1997 Q. When did you first become informed, Doctor, that the United States Public Health Service had taken action with regard to the recognition of the single service container being permitted and recommended for use in cities?

A. When I saw an article in the newspaper to the effect that evidence had been submitted at this trial showing that single service containers or that the ordinance had been changed to permit the use of single service containers.

Q. And did you see the original action or the report from the United States Public Health Service at or about that time or immediately after you read this article in the paper?

A. You mean, the letters from the United States Public Health Service?

Q. Yes.

A. Yes, sir.

Mr. Gariepy: Mr. Golding, will you mark this Plaintiff's Exhibit 89?

(The document referred to was thereupon marked by the reporter Plaintiff's Exhibit 89 for identification.)

Mr. Gariepy: Q. Will you look at Plaintiff's Exhibit 89, Doctor, and tell me whether that is what you saw then?

1998 A. Yes, sir.

Q. Had you previously to that time written any letter to the United States Public Health Service making inquiries concerning their action on this subject of single service containers?

A. Such a letter was written under my signature and while I was out of town, yes, sir.

Q. And did you receive the reply when it came in?

A. No, sir.

Q. What happened to the reply to your letter when it came to your attention or came to the office there, rather?

A. The letter was written at the instigation of the Assistant Corporation Counsel, by Mr. Krueger, during my absence. When the letter came in Mr. Krueger went to my secretary and asked for the letter, saying that the Assistant Corporation Counsel was anxious to have the letter to present at a hearing, and if the letter had not come in they should wire for it. My secretary informed him that the letter had just come in and, as per my instructions, to forthwith turn over all correspondence to the Assistant Corporation Counsel regarding matters of milk at once, that letter was turned over to the Assistant Corporation Counsel for him to handle, because he was

1999 the originating source of that letter. That was about October 9th or 10th, I should say, somewhere in the neighborhood of October 9th or 10th, when the letter came in.

Q. And is that the reason for the conclusion that you did not learn of this action of the United States Public Health Service until you read it in the papers?

A. By this action you refer to that part of the ordinance which refers to the amendment permitting single service containers?

Q. Right, Doctor.

A. There are two sections. Yes, sir. That is not the answer to the second part of it.

Q. Has there been any effort made to you by anyone to rescind the action taken October 16th, 1939, with regard to suggestions for amendment of the ordinance?

A. No, sir.

Q. And that resolution and those suggestions are still in full force and effect in the Board of Health records, October 16th, 1939?

A. Subject to the approval of the Board of Health, yes.

Q. I don't understand. Subject to the approval of the Board of Health? I am referring in my question to the action taken by the Board of Health October
2000 16th, 1939.

A. Yes.

Q. That stands in full force and effect now, that resolution?

A. I had in mind this: We have a meeting and then we have minutes, and then the Board of the Board of Health at its next meeting approves as correct those minutes, if they conform to the ideas of the other members of the Board. It is correct as far as I am concerned, but the minutes would not be up for approval until the next meeting, and always those minutes are not approved.

Q. And subject to whatever suggestions or corrections in the minutes that may exist, they stand as approved?

A. If there are no corrections, yes, sir.

Q. Did Doctor Arnold make any other comment at this meeting of October 16th, 1939, other than passing his vote, saying he was not voting on it?

Mr. Schaefer: That is objected to.

The Master: Objection sustained.

Mr. Gariepy: Q. Do you know, Doctor, whether or not the model code and ordinance as suggested by the United States Public Health Service in the month of January, 1939 had any reference to the use of single service containers at that time?

2001 A. I did not get that.

Mr. Gariepy: Read it, Mr. Golding.

(Mr. Gariepy's last question was read by the reporter as above recorded.)

The Witness: A. I do not recall any model code and ordinance being submitted in January, 1939.

Mr. Gariepy: Q. No, as it existed, the ordinance and

code of the United States Public Health Service, in January, 1939, do you know whether or not there was any reference in that code and ordinance to the use of the single service container?

A. There were no definite standards regarding the use and manufacture of single service containers. There were no definite standards regardings the use and manufacture of single service containers at any time, until just within the past few weeks, when the Board of Health adopted this resolution. Previous to that time there had been no regulations by the United States Public Health Service concerning the use and manufacture of single service containers, and that is why I had not presented any standards to the Board of Health, until the Public Health Service had approved of it.

Q. Have you at any time since February 2, 1939
2002 changed your mind with reference to the use of single service containers for the sale of fresh fluid milk in the city?

A. No, sir. My attitude today is just as it has been consistently. I have never given permission for the use of single service containers. I don't think the Board of Health now has given permission for the use of single service containers and I have never been opposed to the use of single service containers, if they could be so made that fresh fluid milk could safely be served therefrom and that the standards came from the United States Public Health Service.

Q. As long as they complied with the standards and suggestions of that Public Health Service they were O. K. with you?

A. Yes, sir.

Q. Is it customary for an Assistant Corporation Counsel to attend all meetings of the Board of Health, Doctor?

A. Yes. I cannot recall a meeting where there has not been some Assistant Corporation Counsel present. Usually we have two.

Q. Is it customary for the Board of Health of the City of Chicago, of which you are president, previous to taking any action in matters of public health to dis-
2003 cuss the matter with the Corporation Counsel?

Mr. Schaefer: That is objected to.

The Master: I will sustain the objection.

Mr. Gariepy: Q. Do you know anything about the present action of the Board of Health concerning bringing the Mayor Kelly Milk Ordinance up to date?

The Master: Read that question.

(Mr. Gariepy's last question was read by the reporter as above recorded.)

The Witness: A. Yes, sir.

The Master: That is a pretty broad question.

Mr. Gariepy: That is what Doctor Arnold testified they were going to do and he was entering upon the work of doing it.

Q. What action has been taken, that you know of, other than the May 15th, 1939 and October 16th, 1939, actions?

Mr. Schaefer: That is objected to, if the Master please. Any change in the ordinances of the city of Chicago is a change that is made by the City Council, by the adoption of an ordinance.

Mr. Gariepy: Why do you bring in then the October 16th meeting and subpoena the doctor in here? What difference does it make what the Board of Health does if
2004 the City Council passes on it? Why bring in this doctor and take his testimony?

The Master: I will sustain the objection.

Mr. Gariepy: I don't know why counsel brought him in.

The Master: But you did not object to it.

Mr. Gariepy: I don't understand. We are going into the same thing now that counsel asked about.

The Master: Go ahead now. I sustained the objection.

Mr. Gariepy: Q. Do you know who is working upon this matter of revising the Mayor Kelly Milk Ordinance to bring it up to date?

Mr. Schaefer: That is objected to.

The Master: Sustained.

Mr. Gariepy: Q. Have you had any meeting, Doctor, of the members of the Board of Health after the October 16th, 1939 meeting?

A. No, sir.

Q. Do you know why you were subpoenaed to testify here today, Doctor?

Mr. Schaefer: Objection.

The Witness: A. I have absolutely no idea.

The Master: Objection sustained.

Mr. Schaefer: Was there an answer to that question?

Mr. Gariepy: He says he has no idea.
That is all, Doctor.
The Master: Do you want the answer sticken?
2005 Mr. Schaefer: Yes, I do.
The Master: The answer may be stricken.
Mr. Schaefer: I would like to have this document marked Defendants' Exhibit No. 30 for identification.
(The document referred to was thereupon marked by the reporter Defendants' Exhibit 30, for identification.)

Redirect Examination by Mr. Schaefer.

Q. Doctor, will you look at the document which has been marked Defendants' Exhibit 30, for identification, and tell me whose signature that is?
A. That is the signature of the Surgeon-General of the United States Public Health Service, Thomas Parran.
Q. And will you tell the Master what the document is?
Mr. Gariepy: I object. It speaks for itself.
The Master: Well, he can tell us. Go ahead.
The Witness: A. This is a report that was sent—this is an abstract of a report that was sent to the Surgeon-General by the Advisory Board, making suggestions to the
Surgeon-General, in an advisory way, of certain
2006 changes that should be made in the standard ordinance.
Mr. Schaefer: Q. And the document is a letter from the Surgeon-General addressed to you?
A. Yes, under date of June 27th, and received July 5th, showing what the advisory—
Mr. Schaefer: 1939?
A. 1939, yes.
Mr. Schaefer: That is all, Doctor.
Mr. Gariepy: That is all, Doctor.
(Witness excused.)
Mr. Schaefer: Doctor Black.

UNITED STATES CIRCUIT COURT OF APPEALS

For the Seventh Circuit.

I, Kenneth J. Carrick, Clerk of the United States Circuit Court of Appeals for the Seventh Circuit, do hereby certify that the foregoing printed pages contain a true copy of Volume 2 of the printed record, printed under my supervision, and filed on the twenty-first day of February, 1941, which, together with Volumes 1 and 3, constitutes the record in the following entitled cause:

Cause No. 7502.

Fieldcrest Dairies (Inc.),
Plaintiff-Appellee,

vs.

City of Chicago (a Municipal Corporation), Board of Health of the City of Chicago, Dr. Robert A. Black, Health Commissioner and Acting President of Board of Health of the City of Chicago,
Defendants-Appellants,

as the same remains upon the files and records of the United States Circuit Court of Appeals for the Seventh Circuit.

In Testimony Whereof I hereunto subscribe my name and affix the seal of said United States Circuit Court of Appeals for the Seventh Circuit, at the City of Chicago, this 5th day of September, A. D. 1941.

Kenneth J. Carrick,
(Seal) *Clerk of the United States Circuit Court of Appeals for the Seventh Circuit.*

ROBERT A. BLACK, called as a witness on behalf of the defendants, having been first duly sworn, testified as follows:

Direct Examination by Mr. Schaefer.

Q. Will you state your name, please, Doctor?
A. Robert A. Black.
Q. And where do you live, sir?
A. Del Prado Hotel.
Q. And your occupation is what?
A. Physician, pediatrician.
Q. When were you licensed to practice medicine in Illinois?
2007 A. In 1904.
Q. What educational institutions did you attend, Doctor?
A. Washington Academy, Iowa State Normal, Iowa University and Northwestern University.
Q. Are you affiliated with any medical societies?
A. Chicago Medical Society, Chicago Pediatric Society, Chicago Institute of Medicine, American College of Physicians, the American Academy of Pediatricians, the A. M. A.
Q. That is the American Medical Association?
A. Yes.
Q. At the present time, doctor, are you connected with any educational institution?
A. Loyola University.
Q. In what capacity?
A. Presumably the head of the department of Pediatrics, although I am still on leave, though still teaching.
Q. Are there any other educational institutions that you are now connected with, Doctor?
A. No other educational.
Q. What is the nature of your practice, Doctor?
A. Children, entirely.
Q. Are you connected with the Board of Health of the City of Chicago?
2008 A. Yes, sir.
Q. In what capacity are you connected with the Board of Health of the City of Chicago?
A. As a member.
Q. Have you served in any other capacity?

A. I was acting president from some time in the latter part of November until some time in the latter part of May.

Q. November of 1938 and May of 1939?

A. Yes.

Q. During the time you have been connected with the Board of Health of the City of Chicago have you had occasion to consider the matter of the use of paper containers for the distribution of fresh fluid milk in the city?

A. Yes, sir.

Q. When did that matter first come to your attention, Doctor, as nearly as you can remember?

A. Some time in the last part of December or the early part of January.

Q. Of what year?

A. Either December of 1938 or January of 1939, in the very last or the very beginning.

Q. In your opinion, Doctor, is milk an essential item in the diet of infants?

2009 A. Yes, sir.

Q. In your opinion is milk an essential item in the diet of children?

A. Yes, sir.

Q. Based on your experience as a member of the Board of Health and as a pediatrician, do you have any opinion as to the quantity of fresh fluid milk consumed by children under the age of twelve years in the city of Chicago?

A. I would not make an authoritative statement, but I think it would be around 50 per cent.

Q. From the point of view of the health of infants, Doctor, and as a pediatrician, what is your opinion as to the relative merit and demerit of milk containing no paraffin as contrasted with milk which contains undissolved paraffin in quantities varying from one milligram to one hundred and seven milligrams per quart?

A. I know of no work done on that. I know of nothing or no proof from either side. I would prefer my milk not adulterated with paraffin.

Q. You mean, as pediatrician?

A. As a pediatrician, yes.

Q. Doctor, assuming that as a pediatrician you are attending an infant that is suffering from infant diar-

2010 rhea or from some other diseased condition of the stomach or intestines, in the event that you learned that that child was being fed milk which contained undis-

solved paraffin in quantities varying from one milligram per quart to one hundred and seven milligrams per quart, what, if anything, would you do?

A. In milligrams it is hard to translate, but I would have a very strong feeling that if the paraffin was flaky or anything of that sort, I would not use it.

Q. The paraffin is undissolved.

A. If the paraffin is undissolved, in flakes, I would not use it.

Q. And in the event that you found that it was being used, what would you do?

A. I would discontinue it.

Q. Why?

A. After you handle babies awhile you avoid every appearance of evil, even. If you know it is not particularly harmful, or if you have no thought that it is particularly harmful, you are going to avoid any chance whatever, anyway.

Mr. Schaefer: That is all.

Cross-Examination by Mr. Gariepy.

Q. Doctor, do you know any cases of record where 2011 babies have been afflicted with any disease of the intestinal tract and that the disease has been aggravated by reason of undissolved paraffin in milk?

A. I made the statment that I did not know the amount.

Q. This is just your surmise, offhand.

A. Yes.

Q. As a pediatrician?

A. Yes.

Q. When a baby gets milk, it gets the milk warm, doesn't it?

A. Yes.

Q. And to what temperature is the milk warmed?

A. It would be around 98 to 100.

Q. And when would that paraffin melt that Mr. Schaefer asked you about, as being in flaky quantities?

A. I could not say, but I think around 120.

Q. And when you feed this milk to the baby you do not feed it right out of the cup or the bottle, do you? You feed it through some receptacle, don't you?

A. It depends on the age of the baby.

Q. We are talking now about babies one year old or under, Doctor.

A. You feed them through the bottle.

Q. You feed them through a bottle?

2012 A. Yes.

Q. And when you feed them through the bottle you have a nipple on the bottle.

A. Yes.

Q. And is that paraffin so big, that you have in mind, that it would not go through the hole of the nipple?

A. That is what I said; it was flaky.

Q. Did you ever hear or see any flaky particle of paraffin in a bottle of milk that was fed to a baby that did not go through the nipple?

A. I have never fed, to the best of my knowledge, milk to a baby out of a paper bottle.

Q. Or out of any bottle that had paraffin in it?

A. So far as I know.

Q. You do not know of any cases of record where they did that, do you?

A. No, sir.

Q. Paraffin is an inert matter, is it not?

A. So far as I know.

Q. What is it made out of chemically, Doctor?

A. It is made of—well, it is a by-product of oil.

Q. And sometimes children are given oil to secure action in the intestinal tract, are they not?

A. They are.

Q. That does not give them any bad effects, does it?

2013 A. There is a little dispute just now about that. There is some recent literature which seems to show that vitamin C is not absorbed well where the paraffin oil is used.

Q. Do you know what the customary treatment is in Cook County Hospital now, in post operative cases, in order to secure a bowel treatment easily and without distress?

A. I do not.

Q. Do you know whether they give any oil treatments at all there?

A. I give the oil myself.

Q. And did you ever have any harmful effects from doing it?

A. Not that I know of. I am only saying what the recent literature is indicating.

Q. How big is this hole usually employed in these nipples or made in these nipples used on baby bottles?

A. It is quite small. Ordinarily it is said the average needle is used to puncture the hole with.

Q. And the paraffin that you refer to in your opinion, in answering Mr. Schaefer's question, then, I take it, would have to be as big as the end of a needle or large, is that it?

A. Yes.

2014 Q. And you do not know of any cases of that size doing injury, do you?

A. I know of no cases because I have not used it.

Mr. Gariepy: That is all, Doctor. Just a minute, one more question, please.

Q. If the paraffin was of a size sufficient to do any harm, then it would be too large to go through the hole of the nipple, wouldn't it?

A. Well, I would not say just that. If for no other reason, you would be terribly annoyed by having to take the nipple off, and contaminate it, and shake out the paraffin.

Q. But you have had no experience in it?

A. I have had no experience in it.

Q. And have you ever read of any such experience, Doctor, in pediatrics?

A. No, sir.

Mr. Gariepy: That is all.

Redirect Examination by Mr. Schaefer.

Q. Doctor, are babies ever fed milk by any method other than through a bottle?

A. Yes, sir. They are gavaged.

Q. What is that?

A. Fed through a stomach tube.

2015 Q. At what age do infants usually start drinking milk out of glasses, Doctor?

A. Any time from four months on. Usually the mother tries in about five and a half or six months.

Q. Doctor, if an infant five and a half to six months old was suffering from infant diarrhea, the nipple which you have alluded to in answering Mr. Gariepy's question would afford no protection in keeping paraffin from entering the intestinal tract of the baby, would it?

A. It would not.

Mr. Schaefer: That is all

Recross Examination by Mr. Gariepy.

Q. Doctor, have you made any inquiry of pediatricians or health commissioners where single service containers are in use for the distribution of fresh fluid milk in regard to their experience in irritating the tender, sensitive tracts of babies?

A. I have not.

Q. Or these babies that Mr. Schaefer referred to, of four and a half or five months old?

A. I have not.

Q. Or any children up to twelve years old?

A. I have not.

2016 Mr. Gariepy: That is all.

Mr. Schaefer: That is all, Doctor. Thank you.

(Witness excused.)

Mr. Schaefer: Doctor Dulak.

FRANCIS A. DULAK, called as a witness on behalf of the defendants, having been first duly sworn, testified as follows:

Direct Examination by Mr. Schaefer.

Q. State your name, doctor.

A. Francis A. Dulak.

Q. Where do you live, doctor?

A. 2050 Humboldt Boulevard, Chicago.

Q. And your occupation?

A. Physician and surgeon.

Q. When were you licensed to practice medicine?

A. In 1916.

Q. Where did you receive your education, if any, doctor?

A. Loyalo University and the University of Vienna.

Q. Are you connected with the Board of Health of the City of Chicago?

A. Yes, sir.

Q. In what capacity, doctor?

2017 A. At the present time I am secretary of the Board of Health.

Q. For how long have you been connected with the Board of Health?

A. Seven years.

Q. As a member of the Board of Health of the City of Chicago have you had occasion to consider the question of the use of papex containers for the distribution of fresh fluid milk in the city?

A. Yes, sir.

Q. When did that matter first come to your attention?

A. Why, it is some time ago. I do not remember exactly the date.

Q. What personal knowledge, if any, doctor, do you have of the operation of paper mills?

A. None whatever.

Q. Which manufacture paper board for use in paper milk containers?

A. None.

Q. Do you have any personal knowledge of the operation of any paper mills?

A. I have not.

Q. What personal knowledge, if any, do you have of the operation of plants in which paper board for use in milk containers is cut and printed?

2018 A. None whatever.

Q. What personal knowledge do you have, if any, as to the bacterial effect of paraffin on paper?

A. I have none at all. I don't know much about it.

Q. Doctor, have you any personal opinion as to whether or not the use of paper containers for the distribution of fresh fluid milk should be permitted in the city of Chicago?

Mr. Gariepy: I object to that question, as showing no qualifications or ability or knowledge on the part of this witness to answer that question intelligently.

The Master: I will sustain the objection. He has voted as a member of the Board of Health. That is official action. You are now calling him to impeach his own vote?

Mr. Schaefer: No, sir, I am not. You expressed some concern as to why these witnesses were called.

The Master: Not concern. Just interest.

Mr. Schaefer: Then interest. Let me explain my position, if you will, Master.

What is involved in this case, as I see it, is the reasonableness of an ordinance of the City of Chicago. Going to that question, you have been hearing evidence over an extended period, introduced on behalf of the plaintiff,

2019 tending or intended to show the unreasonableness of that ordinance, and evidence introduced on behalf of

the defendants tending or intended to show the reasonableness of that ordinance.

The Master: No, I don't think that is stating the issue quite accurately. As I recall the pleadings, there are two points here. First, that the ordinance should be construed as broad enough to include within the term of "standard milk bottle" paper containers.

Mr. Schaefer: That is right.

The Master: And, secondly, if the ordinance is interpreted so as to exclude the single service container, then the ordinance or the action of the Board of Health thereunder is arbitrary and discriminatory and unreasonable.

Mr. Schaefer: That is right, yes, sir. It is to the second point that I was addressing myself, as obviously this testimony has not to do with the first point.

The Master: You are talking about the ordinance. Nobody has introduced any evidence here as to the resolution of the Board of Health, until you just brought it in here this afternoon, and the Board of Health, up to this time, in its answer at least, made the contention, or made a double
2020 contention, namely, first, that the ordinance, properly construed, excluded the single service container, and, secondly, that the allegations of the bill of complaint, to the effect that the containers are safe and free from any objection, are not well taken; in other words, you deny all of their allegations as to safety.

Mr. Schaefer: And we assert the ordinance is reasonable.

The Master: All right. Now then, you bring in the resolution of the Board of Health, which is a recommendation to the City Council to amend the ordinance to include the single service containers specifically.

Mr. Schaefer: Yes, sir.

The Master: It is to be assumed that unless they thought the containers were safe, they would not make any such recommendation, so that, if anything, the resolution tends to establish the contention of the plaintiff here, that there is no objection to the containers on the ground that they are unsafe or unhealthful.

Now, you come in here with witnesses from the Board of Health. I do not know what their purpose is. You started out by putting them on as witnesses in chief, as just
2021 further experts. The case was reopened here to give you an opportunity to bring in some evidence concern-

ing the resolution. Counsel here have not objected to your putting on further evidence of experts, and I have permitted you to do it. Now, you come along with a witness and ask him whether he has any opinion as to whether the use of paper containers for the distribution of fresh fluid milk is safe. He has expressed himself by his vote on this resolution.

Mr. Schaefer: If I may state my position, it is this: Throughout this trial every time that an expression of opinion with respect to the subject matter in issue here has been made from a new source, from a source that was not heretofore before you, we have attempted to bring it in and have brought it in. For example, the United States adopting these regulations, we brought that matter out on cross-examination. If this matter occurred before we closed our proof, we would have brought it in then. What you have here now is the action of the Board of Health at its meeting on October 16th, as an expression of opinion by a group not heretofore heard from.

The Master: But they are defendants in this case, against whose action complaint is made.

Mr. Gariepy: That is right.

2022 The Master: Who in their answer stated that they thought the containers were unsafe and who, it will be argued, by their action in passing a resolution are now on record as thinking they are all right, excepting that the ordinance does not permit the use of such containers and therefore they recommend an amendment to the ordinance to include such containers. You bring in the resolution of the Board of Health, which impliedly says that now the Board of Health considers those containers as unobjectionable, but not permitted to be used by reason of the language of the ordinance. Now, the evidence here produced by your witness is that all of the members of the Board of Health voted for this resolution, excepting Doctor Arnold, who was present and did not vote either way. What is the purpose of bringing in this witness now, to impeach this resolution?

Mr. Schaefer: No, sir, I have not attempted to do that at any time.

Mr. Gariepy: He has spoken by being a party to the resolution and a member of the Board.

Mr. Schaefer: May I proceed, Master?

The Master: Yes.

Mr. Schaefer: You have here an expression of
2023 opinion, as I said, as to a matter in controversy, by a group not heretofore heard from. Their opinion is entitled to such weight as it gets by reason of their knowledge of this subject and no further, so far as the validity or reasonableness of the ordinance is concerned.

The Master: Now, let us see. You are representing whom here?

Mr. Schaefer: All of the defendants in this case.

The Master: You are representing the Board of Health?

Mr. Schaefer: And the City of Chicago:

The Master: And the Board of Health has stated that it considers the use of the single service container as objectionable. That is, in its answer. Now the Board of Health states that it thinks it is unobjectionable and recommends that the ordinance permit its use. That is, just some of the defendants. Do you object to the use of that opinion as against the City of Chicago, which is also a defendant?

Mr. Schaefer: I do not object to the use of it. I want to show on what it is based, that is all. It is like any other opinion.

The Master: In other words, you want to attack
2024 the weight—

Mr. Schaefer: I am not attacking anything. I am just bringing the facts before you, so that you can give proper weight to that opinion.

The Master: In other words, you want me to give it as little weight as possible?

Mr. Schaefer: Well, if pressed, I suppose I would state that. It seems to me that the knowledge of the men who have expressed an opinion is pertinent in determining what weight to give to that opinion.

The Master: Well, personally, I cannot see how you, representing the Board of Health, which has filed an answer here stating that the single service containers are unsafe, can let the Board of Health come in and express an opinion, based upon the opinion of the United States Public Health Service, that they are safe.

Mr. Schaefer: If that is what it is based on, that is what I want to show. I want to show on what that opinion is based, and I submit I have a right to do that. Now, so far as our putting it in or the plaintiff putting it in, I have no illusion as to whether or not it should have gone into evidence.

The Master: They probably would have brought it in themselves.

2025 Mr. Schaefer: I think so, but it is an opinion as to one of the issues in this case, and I think you are entitled to know on what it is based.

The Master: It is something occurring after the suit, but in the course of trial, in which the defendants, the Board of Health, have apparently changed their opinion or have changed their position on this subject of safety. That is something that the plaintiff might bring in to show the present opinion of the Board of Health. Then the only question remaining in this case, if that action is to be taken as conclusive on the part of the Board of Health, would be whether the ordinance is to be considered as discriminatory and unreasonable because it excludes containers, which the Board of Health says are safe.

Mr. Schaefer: That is right.

The Master: Now, if you were representing only the Board of Health, I doubt whether you could come in here and say that the Board of Health's action is not to be given full weight, which the plaintiff would contend for. But you come in and say that you also represent the City of Chicago.

Mr. Schaefer: Yes, sir. As a matter of fact, I submit that the relation between the clients that we here rep-

2026 resent and ourselves as their counsel is a matter lying between the defendants and their counsel. No defendant has objected. It seems to me no one else has any right to. Here is opinion evidence, and I want to show you on what that opinion is based. I want to find out and I want you to know. It is a factor which obviously you are going to consider in deciding this case.

The Master: In other words, if the Board of Health asks the City Council to pass an ordinance in which the Board of Health says it is safe, I must in this trial before me, in which the Board of Health has said that it is unsafe, tell the Board of Health they are wrong about it, after they solemnly say they think that the container is safe.

Mr. Schaefer: No, sir, that is not what I am saying. As a matter of fact, the inclusion of the individual members of the Board of Health as defendants is a matter of law and is not necessarily involved. What is involved is an ordinance. The ordinance can be attacked without individual defendants. The fact they are individual defendants here

is just because the plaintiff so framed its case. The essential question is still the same, the reasonableness
2027 of that ordinance, and I submit that you ought to hear opinion evidence as it is advanced on that question.

Mr. Gariepy: We object to hearing any opinion evidence, Master, when an official action of the Board is brought in by the defendants, as shown by Mr. Schaefer. If he attempted to impeach their action for fraud or anything else, that is another question, but the counsel is bound, as is the City of Chicago, by the action of the defendants as to the merits of this litigation. It is always the rule that they are bound by such action. It is not a matter of opinion evidence. It is an official action of the Board, passed by resolution, where all of the members were present and took a part, in voting for it, with Doctor Arnold standing by.

The Master: You put your question again now, Mr. Schaefer.

Mr. Schaefer: Q. Doctor Dulak, do you have any personal opinion as to whether or not, from the point of view of the public health, the use of paper containers for the distribution of milk in the city of Chicago should or should not be permitted?

Mr. Gariepy: I object to that question.

The Master: You object on the ground that there is
2028 no qualification shown?

Mr. Gariepy: That is one of the grounds on which I object, and also that the doctor has already expressed himself as a member of the Board of Health by officially voting on the matter.

The Master: Your first objection is that he is not qualified. I will sustain the objection, and in order to shorten it I will let you make your record, Mr. Schaefer.

Mr. Schaefer: I haven't any record to make. I cannot make an offer of proof.

That is all, Doctor.

Mr. Gariepy: That is all, Doctor.

The Master: Ask your question and put it in the record, if you wish.

Mr. Schaefer: No, I do not care to.

The Master: I am offering to let you ask the question of the doctor, if you wish, and have it in the record.

Mr. Schaefer: Yes, sir.

The Master: You do not care to put him on then for that?

Mr. Schaefer: No, sir.

The Master: Very well.

(Witness excused.)

2029 Mr. Schaefer: Mr. Reynolds.

HARRY J. REYNOLDS, called as a witness on behalf of the defendants, having been first duly sworn, testified as follows:

Direct Examination by Mr. Schaefer.

Q. Will you state your name, please?

A. Harry J. Reynolds.

Q. Where do you live, Mr. Reynolds?

A. 3240 Lake Shore Drive.

Q. Are you a member of the Board of Health of the City of Chicago?

A. I am.

Q. For how long have you been a member?

A. Six years.

Q. What personal knowledge, if any, have you, Mr. Reynolds, as to the operation of paper mills which manufacture board for use in paper milk containers?

Mr. Garièpy: I object. There have been no qualifications shown on which this witness could answer.

Mr. Schaefer: That is just the reason for the question.

The Master: Overruled.

Mr. Schaefer: Read the question, Mr. Golding.

2030 (Mr. Schaefer's last question was read by the reporter as above recorded.)

The Witness: I have none.

Mr. Schaefer: Q. And what personal knowledge, if any, have you, Mr. Reynolds, as to the operation of plants in which paper board to be used in paper milk containers is cut, formed and printed?

A. I have none.

Q. What personal knowledge, if any, have you with respect to the bactericidal action of hot paraffin upon paper?

A. Will you repeat that question?

Mr. Schaefer: Read it, Mr. Golding.

(Mr. Schaefer's last question was read by the reporter as above recorded.)

The Witness: A. I have none.

Mr. Schaefer: Q. What personal knowledge have you, if any, with respect to the filling of paper milk containers with milk?

The Master: What is that?

Mr. Schaefer: Filling them with milk.

The Witness: A. I have none.

Mr. Schaefer: Q. Do you attach any public health significance, Mr. Reynolds, to the fact that paper milk containers are uniformly absorbent?

2031 Mr. Gariepy: I object to that question. There has been no showing on the part of this witness that he knows or that he is qualified to answer that question as a public health expert.

The Master: Read the question.

(Mr. Schaefer's last question was read by the reporter as above recorded.)

Mr. Gariepy: I object to that question, Master. It is a subterfuge and attempt to impeach the official action of this officer and this member of the Board of Health, and there is no qualification shown on which he could answer that question intelligently at all.

The Master: Q. Do you know whether they are absorbent or not?

A. Well, I can qualify that in this respect: That after having numerous discussions with the members of the Board of Health at the various meetings, namely, hearing Doctor Black, Doctor Bundesen, Doctor Dulak and Doctor Arnold, who I consider an outstanding bacteriologist, and having it explained to me by him on these occasions, I think the paper is absorbent.

Mr. Gariepy: I move to strike that, Master. His opinion is based on what he heard from somebody else and not of his own knowledge, ability or research.

The Master: Yes, that may be stricken.

2032 Q. You know nothing outside of what somebody else has told you?

A. No. Only after seeing a lot of samples that were tested by Doctor Arnold, it proved to me from a layman's standpoint that they were absorbent.

Q. You never performed any experiments yourself?

A. None whatever.

The Master: What is Mr. Schaefer's question again, Mr. Reporter?

(Mr. Schaefer's question was read by the reporter as follows: "Do you attach any public health significance, Mr. Reynolds, to the fact that paper milk containers are uniformly absorbent?")

The Master: I will let him answer.

Q. Do you attach any significance to it?

A. Yes, I do.

Mr. Schaefer: Q. What significance do you attach to the fact that paper containers are absorbent?

Mr. Gariepy: I am making the same objection, Master, to that question. He is attempting by subterfuge, by asking this witness questions, to impeach his action as a member of the Board of Health in recommending the use of single service containers. It is quite artful and astute
2033 on the part of counsel, but I think it is very obvious to the Master.

The Master: If they are absorbent to a considerable degree, I think it is conceded that there is some health significance, is it not?

Mr. Gariepy: Yes, but he has already gone on record, by Exhibit 29, in saying the ordinance should permit their use, and he cannot impeach his own action.

The Master: That is another question. I think it is agreed here that if paper board containers are absorbent, there is some significance to it.

Mr. Gariepy: There cannot be any public health significance that means anything, otherwise they would not have passed a resolution.

The Master: He says he does regard it as significant.

Q. Now, you have said that you regard it as of some public health significance?

A. Yes.

Q. Do you have any technical knowledge as to in what respect and what effect it may have?

A. Well—

Q. Let me put it this way: Do you have any technical knowledge concerning the effect of the absorbing qualities of paper milk containers?

A. Only that the United States Public Health Service also states that they are absorbent.

2034 Q. I say, do you have any technical knowledge on the subject as to the effect on the public health?

A. Only what I have been told by the doctors or members of the Board.

Mr. Schaefer: That is not my question. That question assumes that technical knowledge is necessary to determine whether or not there is public health significance in the fact a milk container is absorbent. That I submit is a matter that does not require any technical knowledge to answer. Some of the other questions may, but that question does not.

The Master: He has stated whatever he knows about the subject is based upon somebody's else statements to him. I think it is conceded here that if paper board containers are absorbent, it is a question of public health significance. Now then you proceed to ask him in what respect.

Mr. Schaefer: Yes, sir.

The Master: How can he know in what respect?

Mr. Schaefer: Let us see whether he can answer that.

The Master: He stated he has no knowledge of the subject.

Mr. Schaefer: He stated in answer to your question that he had no technical knowledge.

2035 The Master: Yes.

Mr. Schaefer: That is a question for which technical knowledge is not necessary.

The Master: Let us see now.

Q. Do you have any knowledge of any kind upon that subject, of your own?

A. Only that if it is absorbent and milk is put into the paper container, the milk naturally will absorb any ingredients or bacteria that may be in the paper.

Q. That is the extent of your knowledge on the subject?

A. (Witness nods affirmatively.)

Mr. Gariepy: The witness is shaking his head, Mr. Reporter, yes.

The Master: Anything further?

Mr. Schaefer: Q. Do you attach any public health significance to the fact that paraffin gets into the milk which is placed in paraffined paper milk containers?

Mr. Gariepy: I object to that question. It is an assumption on the part of counsel that it does. If this witness is not qualified to answer from a public health standpoint, then he should not be permitted to answer.

The Master: Q. What is your business?

2036 A. What is my line of business?

Q. Yes. I notice he called you Mr. Reynolds. I don't know whether he asked you your occupation.

A. I am the layman member of the Board of Health. I am president of the Independent Boiler and Tank Company.

The Master: How is this witness qualified to give an opinion on the subject of the effect of paraffin?

Mr. Schaefer: Here again I say it does not require any technical knowledge, bacteriological, medical or otherwise.

Mr. Gariepy: Then you can ask a layman about it, Master.

The Master: Yes.

Mr. Schaefer: That is what I am doing.

Mr. Gariepy: Then the Master takes notice of it as a matter of common knowledge.

Mr. Schaefer: That is all, Mr. Reynolds.

Mr. Gariepy: That is all.

(Witness excused.)

The Master: Off the record.

(Discussion had off the record.)

Mr. Schaefer: I offer in evidence Defendants' Exhibits 29 and 30.

The Master: What are they?

2037 Mr. Schaefer: Defendants' Exhibit 29 is a copy of a resolution adopted by the Board of Health of the City of Chicago on October 16th, 1939, with respect to single service containers for milk, consisting of seven pages.

Defendants' Exhibit 30 is a photostatic copy of a letter from Thomas Parran, Surgeon-General of the United States of America, addressed to Doctor Herman N. Bundesen, dated June 27th, 1939, received by the Board of Health July 5, 1939, transmitting to Doctor Bundesen copies of the regulations adopted by the United States Public Health Service with respect to paper containers. That consists of three sheets.

By agreement of counsel, the last two pages of the Defendants' Exhibit 30 are withdrawn, because they are identical with the last two pages of Plaintiff's Exhibit 61.

The Master: Defendants' Exhibits 29 and 30 may be received.

(Said documents, being copy of resolution adopted by Board of Health, October 16, 1939 with respect to single service containers, and a photostatic copy of letter from

Thomas Parran to Doctor Bundesen, dated June 27,
2038 1939, were received in evidence and marked respectively DEFENDANTS' EXHIBITS 29 and 30, and are attached hereto and made a part of the record hereof.)

Mr. Schaefer: That is all, sir. We close now.

Mr. Gariepy: We have Thursday, I understand, for our rebuttal?

The Master: Yes. Let the record show that this hearing will be resumed at 10:00 o'clock A. M. on next Thursday.

(Whereupon an adjournment was taken in the above entitled cause to 10:00 o'clock A. M., Thursday, October 26, 1939.)

2039 • • (Caption) • •

Thursday, October 26, 1939,
10:00 o'clock a. m.

Met, pursuant to adjournment.

Present:

Mr. Gariepy, Mr. Rall, on behalf of plaintiff.
Mr. Schaefer, Mr. Horan, on behalf of defendants.

2040 Mr. Gariepy: Swear the witness please, Master.

DAVID J. DAVIS, called as a witness on behalf of the plaintiff, in rebuttal, having been first duly sworn, testified as follows:

Direct Examination by Mr. Gariepy.

Q. State your name, please.
A. David J. Davis.
Q. And your address, residence.
A. 721 Elmwood avenue, Wilmette.
Q. What is your business or occupation?
A. Dean of the College of Medicine, University of Illinois.
Q. And how long have you been such?
A. Fifteen years.
Q. Is Doctor Lloyd Arnold one of the professors at the University of Illinois, under your jurisdiction?
A. Yes.
Q. I subpoenaed you to produce the contract of employment between the University of Illinois and Doctor Lloyd Arnold concerning his services there.
A. Yes.
Q. Have you that with you?
A. Yes.
2041 Q. Will you produce it, please?
A. Yes (handing document to Mr. Gariepy).

Mr. Gariepy: Mr. Golding, will you mark that Plaintiff's Exhibit 90 for identification?

(The document referred to was thereupon marked Plaintiff's Exhibit No. 90 for identification.)

Mr. Gariepy: Q. Doctor, showing you Plaintiff's Exhibit No. 90 for identification, which you just handed to me, a blue piece of paper dated July 24, 1939, is that the present existing contract of the University of Illinois with Doctor Lloyd Arnold for his professional services as a professor and a member of the staff?

A. Yes.

Q. Is there any other contract with Doctor Arnold concerning his services and the time he is to put in at the University and the time outside?

A. No.

Q. That is all?

A. That is all.

Mr. Gariepy: I offer that in evidence, counsel as PLAINTIFF'S EXHIBIT 90.

Mr. Schaefer: The only objection to that is as to the materiality. We are running up a record here. I do not see that Doctor Arnold's contract with the University
2042 is pertinent. I do not have any feeling one way or the other, if you want to let it in.

Mr. Gariepy: My answer to that is that this is competent. Doctor Lloyd Arnold testified in the record, Page 1711, to be exact, that he had a contract with the Board of Trustees of the University of Illinois for 80 per cent of his time.

Mr. Schaefer: That is what I say. If you want to put it in, O. K.; I don't care. To save time, I will withdraw the objection.

Mr. Gariepy: No, we withdraw the offer, then.

Q. Is there any other contract that you have with Doctor Arnold concerning his services?

A. No.

Mr. Gariepy: You keep this paper then, doctor. Is there any cross-examination?

Mr. Schaefer: No.

Mr. Gariepy: Doctor Lloyd Arnold, will you take the stand?

Mr. Schaefer: Are you through with Dean Davis?

Mr. Gariepy: Yes.

(Witness excused.)

Mr. Schaefer: I am just wondering what the status of the record is.

The Master: This is rebuttal, now.

2043 Mr. Schaefer: Yes, I am wondering with respect to this point. Doctor Arnold's testimony is to the

effect that his contract called for 80 per cent of his time has been challenged and the contract has been produced.

The Master: It shows in the record.

Mr. Schaefer: It has been subpoenaed all over town. It has been here.

The Master: The record now shows that he spends 80 per cent of his time under his contract or he is obligated to spend 80 per cent of his time. You made that statement that the contract shows it and it is conceded by Mr. Gariepy.

Mr. Schaefer: If that is conceded, all right.

The Master: Although I do not know what the materiality is, whether he spends 80 or 50 or 40 per cent of his time there. I don't know what that has to do with the case.

LLOYD ARNOLD, recalled as a witness on behalf of the plaintiff, in rebuttal, having been heretofore duly sworn, resumed the stand and testified further as follows:

Direct Examination by Mr. Gariepy.

Q. Doctor Arnold, you are the same Doctor Ar-
2044 nold who testified here the other day?

A. I am.

Q. And did I understand you to say you were professor of bacteriology at Loyola University in 1922?

A. In 1921. I think I came there in 1921 or 1922, yes, sir.

Q. At what office, what position?

A. I came there in bacteriology, pathology, public health and clinical diagnosis.

Q. As professor?

A. I came there as associate professor and then was promoted to professor.

Q. And what year were you promoted to professor?

A. I have forgotten. The first or second year I was there. I think the second year.

Q. That would be what year?

A. About 1922, I expect, or 1923, I don't know which.

Q. Will you look at a bulletin of the Loyola University School of Medicine for the year of 1921-1922, especially with reference to page 18, listing you as a member of the

faculty, and tell me whether that is a correct listing on the lefthand sheet there?

A. Yes, sir.

Q. As assistant professor?

2045 A. Yes, it must be, if it is in there.

Q. Then you want to stand corrected as to being an associate professor and full professor, is that right?

A. Yes, sir.

Mr. Schaefer: What year does that cover?

Mr. Gariepy: It is the fall, I take it, of 1921, and the whole year of 1922. These are put out in the fall by all of these universities.

Mr. Schaefer: You mean, the scholastic year of 1921 and 1922, running to about June of 1922?

Mr. Gariepy: That is right.

Q. Doctor, you were subpoenaed to produce the cartons or containers and materials that you testified on direct examination you received from the Ex-Cell-O Corporation in the year 1938?

A. Yes, sir, these are the ones. That is all I have left of them (handing cartons to Mr. Gariepy).

Mr. Gariepy: Is this the way they came?

A. No, they came in a package. The outside package is gone. They came to my home address. I picked up those at home this morning. That is all I had left.

Q. Referring to these that you handed me.

A. Yes, sir.

Q. Not those?

A. Those that I handed you, I think, are Pure-

2046 Pak containers.

Q. Was there any letter in connection with that?

A. No, sir, I don't remember a letter at all, Mr. Gariepy.

Q. Were there any Risdon Dairy containers, from the Risdon Dairy in Detroit?

A. I don't remember any of them.

Q. These are blanks of Sylvan-Seal?

A. I don't remember. I didn't look at the dairies.

Q. These are all Sylvan-Seal?

A. I didn't look at the dairies.

Q. Are those the ones you referred to in your direct examination, doctor, as coming from Detroit?

A. Yes, sir. Early in 1938. I don't just remember the date.

Q. You testified on direct also that you did work for Seal-Rite Corporation during the last six months, from June to December, 1938, and I asked you to produce this morning, if you have them, vouchers for services in connection with the last research work and the date you did it in the year 1938 for Seal-Rite Corporation. Have you anything on that?

A. No, sir. I was consultant to Seal-Rite. I was on a monthly remuneration fee.

Q. What I wanted was the last time you received
2047 any remuneration from the Seal-Rite Corporation in connection with their research work on that paper bottle that you referred to on direct.

A. I received the last check from them in December for November's services.

Q. If I understood you correctly on direct examination, doctor, you stated that one hundred and thirty-eight tests were performed in the Board of Health under your direction and suggestion, from February 2, up until the present time, is that right?

A. I do not recall. One hundred and thirty-eight tests?

Q. Yes.

A. No, I would not remember any definite number of tests at all.

Q. You do not?

A. No, sir, I do not.

Q. Do you know exactly how many tests were performed over there at the Board of Health?

A. I do not, no, sir.

Mr. Gariepy: That is all, doctor.

The Master: Any questions, Mr. Schaefer?

Mr. Schaefer: No.

(Witness excused.)

2048 Mr. Gariepy: Mr. Martinek, will you take the stand?

MATTHEW J. MARTINEK, was recalled as a witness on behalf of the plaintiff, in rebuttal, having been heretofore duly sworn, resumed the stand and testified further as follows:

Direct Examination by Mr. Gariepy.

Q. You are the same Matthew J. Martinek who testified here before?

A. Yes, sir.

Q. I subpoenaed you to produce original documents with relation to the tests that you testified you performed in connection with paraffin suspension. Have you those with you?

A. I have.

Q. May I see them?

A. Yes. (Witness hands cards to Mr. Gariepy.)

Q. Are these in the order they were made out, by dates?

A. They are mixed. We had to get them at random this morning. We would have to bring in three hundred of them, to bring them all in.

Q. Can you pick out any of these cards by these tests, Mr. Martinek, on Pure-Pak containers?

2049 A. These were all picked as Pure-Pak this morning. The numbers were referred to, the ones we have there, on the bottoms of the cartons. I can pick out any one you wish.

Q. You say these are all Pure-Pak?

A. Yes, sir.

Q. What shows that? These are just blank numbers. How do you refer to Pure-Pak or another container on there?

A. This dairy number will be found on a Pure-Pak container.

Q. Where are those containers?

A. They are right here, these cards here, right back there. I will bring them out for you.

Q. No, I will get them. Are these the folders in which they came?

A. Yes.

Q. These are Bowman folders?

A. We just saved them. I don't know that they exactly came in those, but we kept the carton forms, those folders.

Q. Where is there anything on there about Dean or Fieldcrest, on these folders? You got them around Cook County or within a radius of seventy-five miles didn't you?

A. I suppose so. I don't know where they got them.

2050 The Master: Q. You did not get them?

A. No, I didn't get those, no.

Mr. Gariepy: Q. And these are the total number of Pure-Pak containers that you say you performed these tests concerning paraffin suspension in milk on?

A. No, sir, they are not all.

Q. How many more of them are there, Mr. Martinek?

A. I don't know.

Q. There is about thirty of them?

A. Here is the only thing. When I counted these up I counted them with the others, with the American Can, so I don't know.

Mr. Schaefer: Mr. Martinek, you might explain to the Master at what time this subpoena was served on you.

A. It was brought in at 9:00 o'clock this morning.

Mr. Gariepy: Q. These numbers that you refer to on the cards, are these numbers indicated on the flaps, is that right?

A. Yes.

Q. You don't know anything about the condition in which these containers that you brought in here this morning were taken from the plant, do you?

A. I do not.

2051 Q. Or whether they were taken from the plant?

A. I do not.

Q. How many altogether, do you know, Mr. Martinek, by looking at these cards, can you tell the Master you performed paraffin suspension tests on?

A. Oh, about twenty or so.

Q. Twenty or so?

A. Yes.

Q. Is that all, or just Pure-Pak?

A. Well, no. There were three hundred, but my chemists ran some of the tests. I supervised the work.

Q. There were three hundred on Pure-Pak?

A. No.

Q. Or three hundred altogether?

A. I don't know how many on Pure-Pak. I absolutely have no idea.

Q. And that applies to the testimony you gave in the record from page 1602 to page 1612 concerning this paraffin suspension test on all of them? You don't know which ones it pertains to, is that it?

Mr. Schaefer: I object to that. How can the witness know what is in the transcript at page 1602?

Mr. Gariepy: Those are the pages on which he gave his testimony.

The Master: Q. Do you know?

2052 Mr. Schaefer: If the Master please, he has not seen the transcript.

The Witness: What is that?

The Master: Read the question.

(Mr. Gariepy's last question was read as above recorded.)

Mr. Gariepy: Q. Whether Pure-Pak or another type of container.

A. I do not.

Q. Did you perform any tests in connection with these containers concerning lead content in milk?

A. No, sir.

Mr. Gariepy: That is all, Mr. Martinek.

The Master: Any cross?

Cross-Examination by Mr. Schaefer.

Q. To the best of your recollection, Mr. Martinek, how many of the containers that you examined for paraffin suspension in milk were containers of the Pure-Pak type, which is the type that you have here?

A. It is pretty hard to say, because we had them mixed. At one time we had quite a few Pure-Paks and then we had the American Can also. It would be pretty hard to tell, because it would be purely a guess and I would not want to guess.

2053 Q. The records would show?

A. The records would show, if we sorted them out. That is what we are doing now.

Mr. Schaefer: That is all.

Redirect Examination by Mr. Gariepy.

Q. Are they in the same condition, these containers you brought over this morning, as when you received them?

A. They also have the methylene blue streaks in them and they might be slightly damaged. I would not know that.

Mr. Gariepy: I see. That is all.

Mr. Schaefer: That is all. Thank you, Mr. Martinek.

(Witness excused.)

Mr. Gariepy: I have not had an opportunity to say a word to this next witness this morning. The fact is, I have never him. So I am going to ask Mr. Rall, who has talked to him, to ask him the questions.

2054 WILLIAM D. McNALLY, called as a witness on behalf of the plaintiff, in rebuttal, having been first duly sworn, testified as follows:

Direct Examination by Mr. Rall.

Q. Will you state your name, please?

A. William D. McNally.

Q. Where do you live?

A. 3734 North Harding avenue, Chicago, Illinois.

Q. What is your profession or occupation?

A. I am a physician and toxicologist.

Q. Are you licensed to practice medicine in the state of Illinois?

A. I have practiced medicine and have been licensed over twenty years in the city of Chicago, Cook County, Illinois.

Q. Did you attend any schools in preparation for the practice of medicine?

A. I did.

Q. Where?

A. The University of Michigan, University of Illinois, and Chicago Rush Medical College.

Q. Did you receive any degrees from any of these schools?

2055 A. I did.

Q. What were they?

A. A.B. from the University of Michigan, M.D. from the University of Chicago, Rush Medical College.

Q. What has been the nature of your practice, doctor?

A. My practice has been largely that of a physician and a consulting toxicologist.

Q. Have you held any official position?

A. Yes. I was toxicologist to Coroner of Cook County for about seventeen years. I established the first laboratory of toxicology in America.

Q. What is toxicology?

A. Toxicology is the science that treats of poisons, their origins and their detection by chemical or other means.

Q. Of what did your duties consist while you were Coroner's chemist?

A. Examination of the organs of human bodies for poison, examination of medicines for poisoning, and examination of clothing and weapons for stains, blood stains, examination of clothing for seminal stains, and research, and the publication of my research.

Q. Have you published any book?

A. I have published two books.

Q. On what subject?

2056 A. On the subject of toxicology and medical jurisprudence.

Q. Have you written any articles, other than books?

A. Yes. Probably two hundred articles on various phases of poisons and their detection.

Q. Are you familiar with the literature relating to poisons?

A. Very much so.

Q. Your referred to being a consultant in toxicology. Of what does that practice consist?

A. That consists of consulting and conferring with industrial concerns or manufacturing concerns regarding hazards in their plants, the examination of employes, examination of the secretions of those people for the presence of poisons, examination of the blood, to see whether there is destruction of the hemoglobin, blood counts, physical examinations, interpretation of X-rays regarding silicosis.

Q. Are you consulted by other physicians?

A. I am.

Q. Are these consultations frequent or infrequent?

A. They occur frequently.

Q. What is the definition of a poison, doctor?

A. A poison is a substance which when absorbed into the blood stream is capable of seriously affecting

2057 the health or causing death, and that is its chief action.

Q. Have you made any special study of metal poisonings?

A. Yes, sir, I have.

Q. Of what does that study consist?

A. I have made special studies of arsenic, lead and manganese, and published exhaustive articles on the latter metal, manganese.

Q. Of what did your special studies of lead poisons consist?

A. Considerable experimental work with animals and work with human beings, showing the elimination of the lead by various agents and diets.

Q. Does lead poisoning have a more technical name?

A. Well, it is sometimes called plumbism. Most of the lead intoxications, it seems, come from men working with solders or in the smelting of lead. In other words, forms of finely subdivided lead are the chief sources of poisoning.

Q. You referred to lead intoxication. Is that synonymous with lead poisoning?

A. Yes, sir, it is. The laity call it plumbism probably more often than they do lead poisoning.

Q. You say the laity do?

A. Yes. They know it as plumbism.

2058 Q. What are the effects of lead poisoning on the human system?

A. Well, we have acute intoxication where a person has taken half an ounce to an ounce of lead acetate, which causes vomiting and diarrhea. Then we have the acute effect of inhalation, where large quantities of lead fumes are inhaled, causing great muscular weakness, destruction of the blood cells and constipation.

Then we have the chronic form of lead intoxication, where there is great muscular weakness and pain in the part of the anatomy that is used most by that individual. Painters get it in the wrist. Men who are shovelling metal into furnaces get it on the anterior front part of the legs and thighs. There is abdominal cramps. There develops a lead line in those individuals having pyorrhea or a defecture denture.

Mr. Schaefer: Q. A lead line, did you say, doctor?

A. Pyorrhea or a defective denture.

Q. The word I missed was, I thought, lead line?

A. Yes, sir, lead line. L-e-a-d l-i-n-e.

Q. Lead line?

A. Lead line is caused by the absorption of lead in the system. It is taken by the blood to the gums which
2059 are diseased and there is hydrogen sulphide there from the decaying of the foods and there is a deposition of very minute particles of lead, which can be seen with the aid of a magnifying glass.

The Master: Q. That is on the gums?

A. On the gums, as they come in between the teeth. It is very rarely seen. Sometimes there is confusion among physicians in diagnosing colored people, seeing an African line and calling it a lead line, which is not so at all. Necessarily all colored people have this blue discoloration below the gums. But this other can be detected by a microscopical examination of a small portion of the affected material squeezed from the gums.

Mr. Rall: Q. Have you seen cases—

A. That is not all. I have a lot more to tell you about that.

Q. All right, continue, doctor.

A. The blood is changed. One of the first things we note in chronic cases of lead intoxication is a reduction in the hemoglobin. Hemoglobin is the red coloring matter of the blood. There is a destruction of the red blood cells, so that in an adult having a count of five million red cells per cubic millimeter of blood, it may be reduced down
2060 to as low as 3,600,000.

These people have arthritic pains in the joints. There is loss of appetite. They lose weight because they have lost their appetite. The pains in the abdomen have been confused with colitis and appendicitis, and those people have been operated on for appendicitis occasionally because of the confusion in the diagnosis.

Diagnosis of lead poisoning can only be made by an examination of the blood showing basophilic stippling or by running a basophilic aggregation known as the McCord test, which is applicable only in acute cases of poisoning.

The other is chronic cases of poisoning, and the demonstration of abnormal amounts of lead in the urine before and after potassium iodide treatments. This is a diagnostic test and my name is connected with the potassium iodide test.

People in the Chicago area eliminate from mere traces of lead up to .09 of a milligram per liter of urine every day.

Q. Are you there referring to the normal?

A. Yes, normal. Anyone in this room would show lead from mere traces up to .09 of a milligram.

The Master: Q. Where do they get this lead?

2061 A. This lead comes from everything we drink and everything we eat. There is not an article which enters your table but what has lead in it.

Mr. Rall: Q. Is that a normal or abnormal condition?

A. That is a normal condition.

Q. And not harmful, I take it?

A. No, sir, it is not.

Q. Have you completed your answer, substantially?

A. I think that covers it.

The Master: Q. Is any part of the lead absorbed in the system as nourishment?

A. No, sir, lead is not a factor, as far as I know, in the metabolism of the human body. The lead taken in these foods, part of it is eliminated in the urine and stool and some of it is deposited in the bones as a tribasic calcium phosphate, an insoluble form, which does not get out into the blood stream, unless the person has an infection, like influenza, pneumonia, or is becoming an alcoholic, when his resistance is lowered and the lead then goes out into the blood stream.

Mr. Rall: Q. Have you seen cases of lead poisoning in adults?

A. Yes, sir, many hundreds of them.

2062 Q. And in children?

A. Yes. I have only seen a couple in children.

Q. What, in your opinion, is one of the causes of lead poisoning in children?

A. Th e cause of the poison in the children was due to eating the paint off of white painted cribs containing lead acetate.

The Master: Q. What kind of cribs?

A. Cribs painted with white lead. The children would chew the woodwork of the cribs and in that way get the paint.

Mr. Rall: Q. From your own personal experience or from a reading of the literature or from consultation with any other physicians or from any source whatever, do you know of any instances where lead poisoning was attributed to or suspected to be caused by the consumption of milk from printed paper cartons?

A. I do not.

Q. What are the principal causes of lead poisoning?

A. The principal causes of lead poisoning are the inhalation of fumes of finely divided lead, from the smelting of lead, from removing it from steel articles with torches, from the manufacture of lead itself, from the lead carbonate, lead acetate, white lead.

2063 Q. Do you know or have you heard from any source of any instances where lead poisoning was attributed to or suspected to be caused by printing inks used on any type of food container?

A. I have not. I never have been consulted in a case of lead intoxication from that. I have never seen anything in the literature regarding intoxication in foods that were contained in cartons or paper printed with a lead-containing ink.

Q. And that applies to liquid foods as well as solid foods?

A. Yes, sir.

Q. In connection with your study and so forth of lead poisoning, have you studied the question of what quantities of lead cause lead poisoning?

A. Yes. In these large number of people that I have investigated, when the quantity of lead in the urine is over one-tenth of a milligram per 1000 cc., then we know that they are suffering from mild forms of lead intoxication, that is, from lead not being eliminated normally. After the potassium iodide treatment, this may be increased three or four times. That, of course, is not lead that is causing any trouble. That is lead that has been stored up in the bones, which we have eliminated by our chemical means.

2064 Q. You have this morning, have you not, examined a number of flat paper cartons, including two cartons which are sealed at the side?

A. I examined similar cartons. I did not put my initials on them and number them to see whether they were the same ones, but they were similar to these.

The Master: Let the record show that counsel has exhibited to the witness flat containers.

Mr. Schaefer: I think they are called blanks, for the record, Master.

The Master: What is that?

Mr. Schaefer: I believe they are called blanks.

The Master: Blanks, yes. The flat ones are made by

the Gardner-Richardson Company and the Ex-Cell-O Corporation, or as produced for the Ex-Cell-O Corporation by Gardner-Richardson Company, Middletown, Ohio.

Mr. Rall: In order not to encumber the record, when Mr. Fisher and, I believe, Mr. Taylor, were testifying, a considerable number of these unformed cartons and some that had the side seal seam, but were otherwise not formed, were produced and examined by witnesses. It is my purpose here, Mr. Schaefer, to get the worst example of offset with the type of ink that contains the largest amount of lead in the evidence here, so that having that in mind,
2065 if these cartons do not have enough offset on them, I would like you to get ones that do.

The Master: What do you mean by offset, for the record?

Mr. Rall: The offset being the impression of ink on the blank or inside of the carton.

The Master: You mean the impression from another container or another blank?

Mr. Rall: Yes.

The Master: With which this surface has come in contact?

Mr. Rall: Yes.

I would like to have the reporter mark this blank Plaintiff's Exhibit 91 for identification.

(The blank carton referred to was thereupon marked by the reporter Plaintiff's Exhibit No. 91 for identification.)

Mr. Rall: Q. I show you Plaintiff's Exhibit 91 for identification, doctor. In your examination of the cartons, printed cartons, is that the worst case of what we call offset that you observed?

A. Yes, I think that is the heaviest that I have seen.

Q. Assume, doctor, that paper intended to be used for the packaging of fresh fluid milk is printed with a
2066 printing ink containing from .2 of 1 per cent to 35 per cent of lead, and that in the printing operation—

Mr. Schaefer: Just a minute. What is that? Ten per cent?

Mr. Rall: From .2 of 1 per cent to 35 per cent.

Q. (Continuing) —the ink on the printed surface offsets against and adheres to the paper lying next to it, so as to leave an offset or smear of the ink on the part of the paper intended to form the inside of the milk container; that

the paper is stored and cut so that at this point in the operation the paper is in substantially the form of Plaintiff's Exhibit 91.

Further assume that this paper is then sealed at the sides to form what is called a blank, with the ends open, but the side seams sealed, in substantially the form of Plaintiff's Exhibit 3.

Further assume that these open ended cartons in that form are placed on a machine, which opens the carton and folds over the bottom flaps so as to form a container, with the side seam and the bottom seam saled, and that in that condition the container is immersed in liquid paraffin U. S. Pharmacopoeia 12, with an American melting point of approximately 125 to 127 degrees Fahrenheit, but as-
2067 sume that in the paraffining operation the paraffin does not cover the ink offset on the inside of the container.

Assume further that the container in this condition is cooled at approximately 40 degrees Fahrenheit, until the paraffin is hardened, and that in that condition it is filled with cool liquid milk, cream, buttermilk or chocolate milk, and that the machine referred to then closes the top of the container thus filled with one of the products mentioned and, under pressure, staples the top flaps, so that the container filled with milk is then sealed in the way that Plaintiff's Exhibit 2 is sealed.

Assume that the pouring spout has not been opened at the time referred to.

Further assume that this package is delivered to a person who places it in the refrigerator for a period varying from twenty-four to ninety-six hours and that the milk or other liquid products referred to is then drunk by said person, or some member of his family.

Do you have an opinion whether or not the presence of the ink on the inside of the carton or any of the other factors which I described in the question presents any hazard
2068 to the health of the person so consuming the milk, or other liquid products mentioned?

A. I have an opinion.

Q. Will you state what that opinion is?

A. That the hypothetical carton as described by you containing milk, that has been allowed to remain to the extreme time of ninety-six hours, would not be a health hazard, because, first—

Mr. Schaefer: May I have the last part of that question read?

(The portion of the question referred to was thereupon read by the reporter.)

The Witness: A. (Continuing.) —the ink—

Mr. Schaefer: I submit that the question asked what the effect would be on the person who consumes that milk. I do not want to interrupt, but the doctor's answer so far indicates that he is not answering the particular question which was asked.

The Master: Let us have the question again.

(The question was read as above recorded.)

The Master: Off the record—

(Discussion off the record.)

The Master: Objection overruled. Go ahead, doctor.

The Witness: A. (Continuing.) —because, first, the pigment contained in these various inks may be lead,
2069 manganese or cobalt, and they are in a base of a gum and linseed oil.

These pigments are heated to a high temperature, to make the ink. The ink as printed upon these cartons forms a film, due to the oxidation of the linseed oil, or a lead linolate, which is difficultly soluble in water, milk and dilute acids.

In order to separate that lead for a chemical analysis, it is necessary to ash it or oxidize it with strong acids, like nitric acid.

Secondly, in addition to the film which is formed on these inks due to the oxidation of the linseed oil, we have a covering of paraffin.

Mr. Schaefer: Now, I object to that, if the Master please. I would have objected to that question before, except when the questioner framed the question he very carefully excluded the paraffin covering of the container.

The Master: Yes.

Mr. Schaefer: However, I will withdraw that objection.

The Master: All right. Read as far as the witness got.

(The witness' answer was read as above recorded.)

2070 The Master: Continue.

The Witness: A. (Continuing.) That was so described in the hypothetical container, such as I have to consider here. That gives a double coating to this ink. The paraffin is insoluble in milk. Therefore, the milk would not get to the lead compound if it were soluble. So you have two barriers for this lead compound getting into the

milk, which would eliminate your ink as a lead hazard or as a cause for lead intoxication.

The Master: Have you completed your answer?

The Witness: A. Yes, sir.

Mr. Rall: Q. Assuming that at the place where this ink is present the paraffin coating, for some reason, is not present. Does that alter your opinion as to whether that presents a health hazard?

A. You would still have your film of oxide of linseed oil present, which is insoluble in the milk. It would not release the lead.

The Master: Off the record.

(Discussion off the record.)

Mr. Rall: Q. The Master suggests that if the first film is not present, which you referred to as the result of oxidation—

A. It would always be present.

2071 The Master: Q. Assume that for some reason it had been taken off.

A. When it dries there would have to be some of it there, because it is just like the paint on a wall or the outside wall of your home, that has got linseed oil, turpentine and the pigment in it, which is subjected to the weather, the rain, the elements, snow, heat, cold and ice, which is the greatest factor for removing that pigment. In other words, that pigment will stay until the linseed oil has become disintegrated by the ice and sleet.

Q. Mr. Rall started to ask you, assuming there were not present either one of those two films, is there enough ink constituting that offset or is there enough lead there present to present a health hazard, which lead might get into the milk?

A. If it was in an insoluble form, no, as the maximum amount of offset as I see it in that exhibit here would not present a health hazard.

Mr. Schaefer: Will you read the Master's question?

(The record was read as above recorded.)

The Witness: The answer was: "No."

The Master: Q. That is to say, the amount of lead in the ink would not be soluble?

A. It would not be soluble in milk, no, sir. But
2072 you have that double protection here. You have the oxidation envelope of lead, because this ink is manufactured with heat applied to the gums and the linseed oil.

Q. Let us go one point further now. Let us assume there is not a film of paraffin, there is not the oxidized film, and that the lead in the ink is not in insoluble form, but is soluble; is there enough lead present in that ink constituting this offset to present a health hazard?

A. In my opinion, no.

Mr. Rall: Q. And is that opinion based upon your knowledge of chemistry, your practice of medicine and your study of toxicology?

A. Yes, sir.

Q. In the hypothetical carton and the circumstances surrounding it which I gave, do you have an opinion whether there is any hazard to the public health involved?

A. From the milk contained in any carton similar to what I have been presented, no, sir; I cannot see any health hazard.

Q. In the case of lead poisoning, are there any aspects of it which are peculiar to infants?

2073 A. Yes. Infants absorb the lead and it is fixed in the cranial bones, the epiphyseal or long bones of the infants, and that can be demonstrated by the X-ray.

The Master: Q. What are the epiphyseal bones?

A. That is where the bone is not ossified. Our bones are not completely ossified until we have reached the age of eighteen, and then there is a calcium deposition at the ends of the bones.

Mr. Rall: Q. In giving your opinion and the reasons therefore, have you considered the health hazard as it related to infants as well as to adults?

A. Yes, sir.

Q. And that under the hypothesis given it is your opinion that there is no health problem either as to adults or infants, is that correct?

A. Yes. By the administration of milk you are giving one of the best antidotes that we know in toxicology for lead intoxication, because of the calcium in this milk. It causes a deposition of the lead in the bones. In industrial plants, in which I have been a consultant, I give them milk to drink, where they are exposed to high concentrations of lead during the mixing of lead paints, with the end results that we have not had lead intoxication in those plants

2074 where they are taking milk.

Q. At the other end of the life scale, take a senile

person, would your opinion that no health hazard is presented apply equally to such a person?

A. Oh, yes. They are still drinking milk, which, as I said, is one of our best antidotes, and there would not be enough coming off of this offset to be a health hazard.

Q. Are familiar with paraffin, pure refined paraffin, meaning U. S. Pharmacopoeia Standard 11, with an American melting point of approximately 125 to 127 degrees Fahrenheit?

A. I have used paraffin in the laboratory. I have seen it used at home, in the capping of jells and jams. It has been used in my home for a good many years in that manner. I have used large quantities of that same sort of paraffin in cutting sections of human organs, when I was interested in pathology.

Q. I believe the last edition of the U. S. Pharmacopoeia is 11?

A. Yes.

Q. And my hypothetical question I referred to U. S. Pharmacopoeia 12. Without objection may that be changed?

2075 The Master: Q. Does that make any difference in your opinion, doctor?

A. No, because it will be 12 now instead of 11. The new one is under revision at the present time.

Mr. Rall: Q. Do you have an opinion as to whether the taking of paraffin in quantities of from 1 milligram to 107 milligrams, of the kind described, through the mouth, is harmful to health?

Mr. Schaefer: I object to that, if the Master please, because the question is not proper rebuttal and the answer will not be proper rebuttal. The only question that was asked with respect to that subject dealt with infants under the age of one year. No question was asked with reference to adults. So far as infants are concerned, Doctor McNally's qualifications have not yet been demonstrated.

Mr. Rall: So far as the general question of whether it must be limited to infants under one year is concerned, Doctor Arnold referred to what he called the ingesting of paraffin. No, I am wrong. He was talking about the ingesting of the milk. He talked about the presence of paraffin being an adulterant and referred to the fact that while it might not be harmful to adults, upon which,

2076 as I recall, he expressed no opinion, or at least no

adverse opinion, nevertheless he did refer to adults, and I think I am entitled to show it both generally and specifically.

The Master: You have not qualified this witness, have you, on that? You qualified him as an expert on poisons.

Mr. Rall: Well, I will withdraw the question and ask him this:

Q. Doctor, have you an opinion as to whether paraffin of the kind described is a poison?

A. It is not.

The Master: Q. Either to adults or infants?

A. To anyone.

Mr. Rall: Q. Is there anything about its chemistry which in your opinion is harmful to human health, either adult or infant?

A. It is not.

Q. Is there anything about its physical properties, in the quantities described, from 1 milligram to 107 milligrams, which if taken through the mouth, either by an infant or by an adult, is harmful to health?

Mr. Schaefer: I object to that, on the ground the witness is not qualified to express an opinion on that question.

2077 The Master: What other qualification do you want him to have?

Mr. Schaefer: What does the doctor know about the health of infants?

The Master: Do you want to qualify him along those lines, Mr. Rall?

Mr. Rall: Yes, I will go a little further.

Q. What, if any experience have you had in the use of paraffin or paraffin products in connection with your medical and professional work?

A. I have never given paraffin internally as medicine. I have given mineral oil, which is a higher grade of mineral product than paraffin. I have never given it internally and it is not given internally in the United States Pharmacopoeia.

Q. What has been your experience with the products —do you say mineral oil?

A. Yes.

Q. What has been your experience in that regard?

A. I have given lots of mineral oil as a laxative. It is not digestible. Neither is the paraffin digestible. It passes through unchanged in the stool.

Q. If the taking of paraffin were to cause disturbances to the human body, would that be the type of case that
2078 would come to you professionally, in connection with your consulting work?

A. Yes. If paraffin had been considered by physicians as an irritant or some firm was manufacturing a product which was encased in a paraffin-coated receptacle, I would be one of the people in the United States to be consulted along that particular line.

Q. Are you familiar with medical literature generally?

A. I am.

Q. Do you know of any instance, either in the literature or from your own experience or from consultation with other physicians, or from any source, when bodily disturbances of any kind were attributed to or suspected to be caused by the taking of paraffin, the accidental or other taking of paraffin through the mouth by any individual?

A. I do not. I have chewed paraffin. I have seen numbers of other people who have chewed paraffin half a day, day after day, and undoubtedly swallowed particles that were more than 100 milligrams, without any ill effects.

The Master: Q. Would you recommend its presence in milk?

A. It would be a foreign body in milk. It would
2079 not conform to the Pure Food Act, if it was there to add bulk or weight to milk. In a receptacle like this, the paraffin that would come off would be extremely small. If I should crush one of these corners, the particles under the microscope would probably be not larger than six times the size of a blood cell, which would not hurt anybody in swallowing it. There is no place on this carton where one piece would come off of the size of a 100 milligrams.

Q. You would not find any objection to milk because it contained paraffin?

A. In what quantities? It would not be harmful to the individual, no, sir.

Q. In any quantity would you find any objection to milk, if it contained paraffin?

A. If the paraffin were of the size of peanuts or marbles, I would not want to drink milk containing paraffin like that, no, sir, but it would not be ascertained in milk any more than the chocolate would in chocolate milk.

Q. Let us assume a little different case. Let us assume you have a person with colitis or with diarrhea, a person with a sensitive bowel, either adult or infant. Would you say that the presence of paraffin in the milk might present a health problem?

2080 A. If it was in large particles, several grains in size, and a person had an inflamed bowel, it might act as an irritant, but such particles I cannot conceive of coming off from a parcel or package such as has been exhibited to me in this court room.

Does that answer your question?

Mr. Rall: Q. Doctor, I forgot one question on the matter of your experience. Are you a member or have you been a member of any professional societies or organizations?

A. Yes. I am a member of the American Chemical Society, Chicago Chemical Society, American Public Health Association, Illinois Medical Society, Chicago Medical Society, American Medical Association. I guess that is all.

Q. In what types of publications have your articles that you referred to been printed?

A. They appeared in Journals of Public Health, American Medical Journal. They appeared in Medical Record, Michigan State Medical Society Journal, India a State Medical Journal, the Journal of Industrial Medicine.

Q. You were requested to appear here by Mr. Fred Gariepy, is that correct?

A. Yes.

2081 Q. You never saw Mr. Gariepy or me before today?

A. No, sir.

Q. And you have conferred with me before your testimony?

A. Yes, sir.

Q. And you expect to be compensated for your consultation and for your appearance here?

A. I do.

Mr. Rall: You may cross examine.

The Master: There is one more question.

Q. I mentioned the case of an irritated or sensitive bowel. Let us take the case of a diseased gall bladder or liver or some other organ which has to do with digestion. Would you say the presence of paraffin would make any difference?

A. Absolutely not, because the paraffin would be elimi-

nated by the gastro-intestinal tract. Not being soluble, it would not get to the liver, which is the filter of the human body, nor to the gall bladder. It would not cause an irritation in either instance.

Q. Would it impose any work upon the activities of those organs?

A. No, sir, it would not, because nothing is needed to digest this piece of paraffin. It is not digested by the
2082 various enzymes and juices that are present in the stomach and the gastro-intestinal tract, including the duodenum, ilium and colon. Those are just subdivisions of the gastro-intestinal tract. With your stomach there you have a complete gastro-intestinal tract. Starting with your mouth and going to your stomach and running down to the rectum, you have a complete G I tract.

Q. Does raw milk contain any bacteria?

A. Yes, sir, it does. I have seen it in the city of Chicago, when I was in the Health Department, contain many millions of organisms.

Q. Would you say that bacteria from the milk adhere to particles of paraffin in the milk?

A. If that particle of paraffin contained protein or other substances found in the milk, yes; it could grow around the protein, just the same as it could grow on the edge of a bottle.

Q. Let us assume that the bacteria are already grown. Do you think—

A. Paraffin would be an un-nutrient medium and therefore would not offer a suitable food for bacteria. In other words, bacteria would not grow readily on paraffin, unless this paraffin was surrounded by food elements which are contained in milk, like lactose, protein, fats, salts.
2083 Milk affords a suitable medium for bacteria to grow, at a suitable temperature.

Q. Let us assume this: The bacteria do not grow as you describe, let us say, but may, nevertheless be in the paraffin.

A. Well, they could not be in the paraffin, unless the paraffin had been rolled around in some putrid material, because the bacteria would not penetrate the paraffin.

Q. You say the bacteria do not penetrate paraffin?

A. It would not penetrate paraffin. It would not grow in it. It has no nutrient in it at all.

Q. Could not bacteria go through the paraffin?

A. No, it could not.

Q. From the milk into the wall of the container and back again?

A. No. You look at your home, as the Mrs. cans jams and jellies, and you have an observation to show why paraffin is used for the cappings of these bottles, because they prevent bacteria and yeasts entering the jams and jellies. They can light on the outside and they will never go through.

Q. Your opinion then is that bacteria do not penetrate paraffin?

A. That is right, they do not penetrate paraffin.

Q. And if there are any bacteria in the wall of
2084 these paper containers, they cannot get into the milk through the paraffin?

A. That is right.

Q. And vice versa—

A. They would not get out into the—

Q. And vice versa, the bacteria from the milk could not get into the wall of the container?

A. Unless there was a break in the paraffin. Then they could.

Mr. Rall: Q. In the hypothetical question, Plaintiff's Exhibit 91 was referred to. I want you to assume for the purpose of this next question that the offset ink on the inside of the hypothetical carton was even greater in amount than that which you see on Plaintiff's Exhibit 91, considering the amount of ink on the outside of the carton and assuming that the inside of the carton was offset with even more of the same type of ink than appears on it. Would that change your opinion as to whether or not the presence of that offset presented a health hazard?

A. No, it would not.

Q. Why?

A. Because, for the reasons stated, you have an in-
soluble compound here, due to the oxidation of the
2085 linseed oil and the formation of an insoluble lead compound, or, if it happens to be manganese, the same applies, which is insoluble in water and which is insoluble in milk.

Q. Would the quantity of lead, assuming as much as 35 per cent of lead in the ink, which could, in your opinion, be offset upon the inside of such a carton, would such an amount, in your opinion, be sufficient to cause lead intoxication?

A. It would not.

Mr. Schaefer: I object to that, for the reason that the witness is not qualified to express an opinion as to how great an offset there may be. The question calls for the witness' opinion on that point.

The Master: I will let it stand. You may cross examine. It will go to the weight of his testimony.

Mr. Rall: Without putting all of these things in the record, I am frank to say that I want the worst case of offset that counsel can find or describe. I am unable to know exactly how to describe it in words.

The Master: I would like to ask a question that may perhaps throw some light on the amount of offset.

Mr. Rall: Yes.

The Master: Q. As I understand you, doctor,
2086 the lead in the ink would not be soluble in the milk for two reasons. One is that you have an oxidation film and the other is that you have a paraffin film.

A. That is right.

Q. And you say that ink when it dries just takes this oxidation film?

A. It forms a film, due to the oxidation of the linseed oil and the ester gums which might be in this particular preparation.

Q. If that is true as to the offset, wouldn't it also be true as to the face of these containers, where you have the full printing?

A. Yes. I would be willing to drink milk day after day with the ink on the inside of the package and have that milk seventy-two hours old.

Q. That is what I am getting at.

A. Yes, sir. I would absolutely not be afraid to drink any milk in a container like that.

The Master: Then it does not make any difference, Mr. Rall, how heavy the offset is.

Mr. Rall: In my humble way that is what I was trying to describe, and I did not do a very good job of it.

The Master: In other words, the doctor says it does not make any difference whether you have merely or whether you have the full printing on the inside of the con-
2087 tainer.

Mr. Rall: Yes.

Q. Now, doctor, in answer to the first hypothetical question you stated that milk kept under the conditions described in the hypothetical question for ninety-six hours,

did not, in your opinion, present a health hazard. Would that also be true—

A. As to lead.

Q. As to lead, yes.

A. Because in ninety-six hours the bacterial count is several million.

Q. But I was referring only to the lead.

A. Kept in an ice box, then it becomes a health hazard, because of the increase in the bacterial count.

Q. But what relationship does the time have in the answer to the question as concerns the possibility of lead poisoning?

A. With this film, nothing.

Q. So your answer was an answer to what you consider an extreme case?

A. Yes.

Q. And would include and cover—

A. With the one proviso that after ninety-six hours there are no defects in this paraffin that would loosen the paper. Suppose this was folded inside. If it would
2088 loosen all of this and the person would get the lead into his system mechanically, then he might show some signs of intoxication, if he got all of the lead from this paint at one dose. We do not believe that would be possible, or I do not.

The Master: May I ask him another question here?

Mr. Rall: That is all right. He is here for that purpose, Master.

The Master: Q. You say that the paraffin does not permit the passage of bacteria from the milk into the wall of the container, that it prevents it?

A. Yes, sir.

Q. And it does not, by the same token, permit the passage of any moisture or any of the milk into the wall of the container, is that correct?

A. That is right. It protects it.

Q. Then you would say that the wall of the container is non-absorbent?

A. It is rendered impervious by the coating of paraffin. That is the purpose of it.

Q. That is your opinion?

A. Yes. Any defects in the paraffin, however, would allow moisture to get through and would undermine that paraffin.

Q. Does this ink have any odor?

2089 A. When it is being made, yes, it would have an odor, but there is very little odor to any ink, unless it has got a preservative like phenol. Take your writing fluid, like the fluid the court reporter is using here; that probably has got phenol in it, to preserve it. That type of ink does not require the skill of manufacture that this type does. That kind of ink will run. I can put my hand on this and it will make a splurge. I can rub this and there will be no splurge, because there is a film on it. That, under the miscroscope, looks like a thousand little dots.

Q. You mean the court reporter's ink?

A. Yes, the court reporter's ink. If I put it under a microscope, as I have done for many years, it looks like millions of little dots. This will not have that appearance.

Q. Referring to the ink on the container?

A. Yes.

Q. This ink on the container you say has no smell whatever?

A. Yes, there is an odor. When you have these cartons piled up in six foot piles in the printing shop, there is somewhat of an odor, due to the pigments, but as it is here, there is no odor at all.

2090 Q. Would you say that if a container is freshly printed and shortly thereafter sealed and made into a form of container such as is shown here, and if the printing were on the inside of such a container, would you say that some of the ink odor might get into the milk?

A. No, that is very small. The only way you smell that ink odor is where there are big piles of these lithographs on the floor of the printing plant. You can take a large pack, like he has at hand there, and there would be no odor at all. But, freshly printed, yes, there is an odor.

Q. Have you performed any experiments to ascertain whether paraffin will permit the passage of bacteria?

A. Well, I have not performed any experiments to show that paraffin will permit the passage of bacteria through a package like this, no, but I know that is why it is used, because it does not permit the passage of yeasts and bacteria. That is common household knowledge. That is why that is used.

Q. Is that also your medical knowledge?

A. Oh, yes. It gives a coating that bacteria will not penetrate.

The Master: Anything more, Mr. Rall?

Mr. Rall: No.

2091 The Master: We will have a recess of a few minutes, then.

Mr. Schaefer: This is off the record. It is now 12:00 o'clock noon.

(Discussion off the record.)

The Master: We will recess until 1:30, in this room.

(Whereupon a recess was taken to 1:30 o'clock p. m. of the same day, Thursday, October 26, 1939.)

2092 • • (Caption) • •

Thursday, October 26, 1939,
1:30 o'clock P. M.

Met pursuant to recess.

Present: Same as before.

The Master: You may proceed.

Mr. Rall: While we are waiting for the witness, there are some exhibits which we want to offer that we might consider. Mr. Horan and I went over the list of exhibits yesterday.

Plaintiff's Exhibit 42, being a picture of a soaker bottle washer, which was identified at Page 487 of the transcript, simply to show the type of machine the witness was discussing, was not offered in evidence, and we now desire to offer it.

Mr. Schaefer: I have no objection.

The Master: It may be received.

2093 (Said photograph of soaker bottle washer so offered and received in evidence, was marked PLAINTIFF'S EXHIBIT NO. 42 and is attached hereto and made a part hereof.)

Mr. Rall: Plaintiff's Exhibit 47-A was included in a general offer, identified at Page 946 of the transcript, but was omitted in the list of exhibits received at Page 1025. We re-offer that, to correct the record.

The Master: Any objection?

Mr. Schaefer: No.

The Master: It may be received.

(Said document so offered and received in evidence, was marked PLAINTIFF'S EXHIBIT 47-A and is attached hereto and made a part hereof.)

Mr. Rall: Plaintiff's Exhibit 57, referred to by Doctor Prucha, was identified at Page 988 of the transcript, but was erroneously omitted in the offer of the exhibits at Page 1025 of the transcript. We would like to offer that at this time.

The Master: Any objection?

Mr. Schaefer: No objection.

The Master: It may be received.

(Said document so offered and received in evidence, was marked PLAINTIFF'S EXHIBIT 57, and is attached hereto and made a part hereof.)

2094 Mr. Rall: Plaintiff's Exhibit 58 was identified at Page 990 of the transcript, but was erroneously omitted from the offer of exhibits on Page 1025 of the transcript. We desire to offer that.

The Master: Any objection?

Mr. Schaefer: No.

The Master: It may be received.

(Said document so offered and received in evidence, was marked PLAINTIFF'S EXHIBIT 58, and is attached hereto and made a part hereof.)

Mr. Rall: Apparently there was no exhibit described as Plaintiff's Exhibit 82, but the transcript at page 1369, in connection with the offer of exhibits, refers to Exhibit 82, so it will be understood that the exhibits should have ended at 81 in that offer, instead of 82.

Mr. Schaefer: Is there an exhibit 82 in the record at all?

Mr. Rall: There is not.

Plaintiff's Exhibit 83, identified on cross-examination by Doctor Lloyd Arnold, is a letter from Doctor Arnold to George D. Scott, dated December 17, 1937. We offer that in evidence. It was identified at page 1877 of the transcript.

The Master: Any objection to that?

2095 Mr. Schaefer: No, sir.

The Master: It may be received.

(Said letter from Doctor Lloyd Arnold to George D. Scott, dated December 17, 1937, so offered and received in evidence, was marked PLAINTIFF'S EXHIBIT 83, and is attached hereto and made a part hereof.)

Mr. Rall: Plaintiff's Exhibit 84 is a two-page original letter of Doctor Lloyd Arnold to Mr. George Scott, dated December 9th, 1937, a special delivery envelope, and a purported carbon copy of a letter from Doctor Arnold to Doctor Thomas Parran, Surgeon-General, dated December

9th, 1937, identified by Doctor Arnold on his cross-examination.

The Master: Any objection?

Mr. Schaefer: No objection.

The Master: It may be received.

(Said letter from Doctor Lloyd Arnold to Mr. George Scott, dated December 9, 1937, special delivery envelope and carbon copy of letter from Doctor Arnold to Doctor Thomas Parran, dated December 9, 1937, so offered and received in evidence, were marked PLAINTIFF'S EXHIBIT 84 and are attached hereto and made a part hereof.)

2096 Mr. Rall: Plaintiff's Exhibit 85, a one page letter, dated November 12, 1937, from A. W. Fuchs, Senior Sanitary Engineer, to S. E. Dean, Jr., was identified by Doctor Arnold on cross-examination, at page 1888. I now offer it.

The Master: It may be received.

(Said letter dated November 12, 1937, from A. W. Fuchs to S. E. Dean, so offered and received in evidence, was marked PLAINTIFF'S EXHIBIT 85, and is attached hereto and made a part hereof.)

Mr. Rall: Plaintiff's Exhibit 86 is a photostat of a letter dated November 26, 1937, from Leslie C. Frank, Senior Sanitary Engineer, to S. E. Dean, Jr., identified at Page 1888, is offered in evidence.

The Master: Any objection?

Mr. Schaefer: No objection.

The Master: It may be received.

(Said photostat of letter, dated November 26, 1937, from Leslie C. Frank to S. E. Dean, so offered and received in evidence, was marked PLAINTIFF'S EXHIBIT 86 and is attached hereto and made a part hereof.)

Mr. Rall: Plaintiff's Exhibit 87 is a one page letter dated February 7th, 1938, from Doctor Lloyd Arnold

2097 to George D. Scott, identified at page 1951 of the transcript.

The Master: Any objection?

Mr. Schaefer: No objection.

The Master: It may be received.

(Said letter dated February 7, 1938, from Doctor Lloyd Arnold to George D. Scott, so offered and received in evidence, was marked PLAINTIFF'S EXHIBIT 87 and is attached hereto and made a part hereof.)

Mr. Rall: Plaintiff's Exhibit 88 is not offered.

Plaintiff's Exhibit 89 is a copy of a letter dated October

6th, 1939, from Walter N. Dashiell, Associate Public Health Engineer, United States Public Health Service, to Doctor Herman N. Bundensen, to which he attached four typewritten sheets, dated October 7th, 1939, entitled, "Section 10 as it will appear in the 1939 printed Public Health Service Milk Code," said four sheets being identical with the text of pages 2, 3, 4, and 5 of Defendants' Exhibit 29, which is already in evidence. By agreement, the four pages of this exhibit already included in the record as part of Defendants' Exhibit 29 are omitted.

Mr. Schaefer: That is agreeable.

2098 The Master: Exhibit 89 is received.

(Said letter dated October 6th, 1939, from Walter N. Dashiell to Doctor Herman N. Bundesen, so offered and received in evidence, was marked PLAINTIFF'S EXHIBIT NO. 89 and is attached hereto and made a part hereof.).

Mr. Schaefer: I have two documents which I want to offer, and that will straighten out this portion of the record and we will have it all in one place.

I want to offer Defendants' Exhibit 7, which was identified by Doctor Prucha while he was testifying and which is a table showing the reports of certain experiments performed by him. It was overlooked at the time the other exhibits identified on that day were offered in evidence.

Mr. Rall: No objection.

The Master: It may be received.

(Said table identified by Doctor Prucha so offered and received in evidence, was marked DEFENDANTS' EXHIBIT NO. 7, and is attached hereto and made a part hereof.)

Mr. Schaefer: The other document which I would like to take up is Plaintiff's Exhibit 88, which was identified at the last hearing, and referred to by counsel for the plaintiff in examining certain of the witnesses who tes-

2099 tified on that day. That document was a report of certain proceedings taken by the Board of Health on May 15th, 1939. I have here an excerpt from the minutes of the Board of Health on that day, which show the action of the Board with respect to that matter, and I would like to have that marked for identification and received in evidence as Defendants' Exhibit 31. The plaintiff has not seen fit to offer its Exhibit 88.

The Master: Do you object to this, Mr. Rall?

Mr. Gariepy: Yes.

Mr. Rall: Unless we can get an agreement as to who was present, so we can make the record in that respect complete.

The Master: You have already testified to this, haven't you, as to who was present?

Mr. Rall: No. Doctor Bundesen referred to the minutes, but did not say who was present.

Mr. Gariepy: Let us find out who was there.

The Master: What is this supposed to be?

Mr. Schaefer: That is action taken by the Board of Health in respect to—

The Master: What is it, minutes or what?

Mr. Schaefer: Those are minutes of the Board of Health, yes, sir. That is what I stated at the out-
2100 set. These are minutes of the Board of Health of a meeting held on that day.

Mr. Rall: Our objection is that it is not complete, but that may be obviated by his later information.

Mr. Gariepy: Showing who was present, to make it complete.

The Master: Subject to putting in the facts as to who were present—

Mr. Rall: And the vote on the resolution.

The Master: (Continuing.) —and the vote on the resolution, the document may be received as Defendants' Exhibit 31.

(Said excerpts of minutes of Board of Health meeting, held on May 15, 1939, so offered and received in evidence, was marked DEFENDANTS' EXHIBIT 31, and is attached hereto and made a part hereof.)

Mr. Schaefer: It is stipulated that at the meeting of the Board of Health on May 15th, 1939, all of the members of the Board of Health were present, except Doctor Bundesen, and all present voted in favor of the resolution.

The Master: How about these cartons that were identified this morning? Do you want to put those in?

2101 Mr. Rall: We will offer in evidence Plaintiff's Exhibit 91 the green printed carton referred to in Doctor McNally's testimony.

The Master: Is that the only one?

Mr. Rall: Yes.

The Master: It may be received.

(Said green printed carton so offered and received in evidence, was marked PLAINTIFF'S EXHIBIT 91, and is attached hereto and made a part hereof.)

Mr. Rall: Mr. Reporter, will you mark that Plaintiff's Exhibit 92 for identification?

(The document referred to was thereupon marked by the reporter Plaintiff's Exhibit No. 92, for identification.)

Mr. Rall: I offer in evidence Plaintiff's Exhibit 92, an original one page letter, dated September 16, 1939, from A. W. Fuchs to George Scott.

The Master: A. W. Fuchs is of the United States Public Health Service?

Mr. Rall: Yes.

The Master: And Mr. Scott is sales manager of the Ex-Cell-O Corporation, the Pure-Pak division?

Mr. Rall: Right.

The Master: It may be received.

2102 (Said letter from A. W. Fuchs to George Scott, dated September 16, 1939, so offered and received in evidence, was marked PLAINTIFF'S EXHIBIT 92 and is attached hereto and made a part hereof.)

The Master: Are you ready for the witness now?

Mr. Schaefer: Yes.

Mr. Rall: There is one question that I would like to ask before the cross examination.

WILLIAM D. McNALLY, a witness called by the Plaintiff, in rebuttal, having been heretofore duly sworn, resumed the stand and testified further as follows:

Direct Examination (Continued) by Mr. Rall.

Q. We referred this morning, doctor, to milligrams of paraffin. Can you give the Master some equivalent as to describing what a milligram of paraffin is?

A. Yes, I can tell you what a grain is in milligrams and give the English picture of how the grain and milligram came into existence.

The grain is the average weight of a well dried kernel of wheat. That was our early English system of desig-

2103 nating weights. As this measure was transposed into the metric system or the French system, we then began to use grams and fractions of a gram. A gram is 15.45 grains. A grain is .0645 grams. So if you can picture a well dried kernel of wheat, you have the picture of a grain which is 64.5 milligrams.

Q. Is that the measurment by weight?

A. That is the measurement by weight, given in the United States Pharmacopoeia, National Formulary, United States Dispensary, and a recognized measure used by the pharmacists and the practicing physician.

Q. About how large would a piece of paraffin of 107 milligrams be?

A. It would be a little larger than a grain of wheat.

Mr. Rall: That is all.

Cross-Examination by Mr. Schaefer.

Q. Doctor, what do you mean by a hazard to health?

A. Anything that would cause injury to that particular individual's well being.

Q. Is lead taken into the human body through the mouth beneficial to health?

A. No, sir, it is not. In small quantities it would have no effect.

2104 Q. Just answer the questions that I ask you, doctor. You have testified a good deal and you understand. So just answer the questions that are put to you. Does milk contain lead?

A. Yes, sir, it does.

Q. Does milk, fresh fluid milk as it comes from the cow, contain lead?

A. It contains lead as I have examined it from glass containers. I have never examined it as it came from the udder of a cow and put into pyrex bottles.

Q. Pyrex what?

A. Pyrex bottles, which are lead-free. They are glass containers which are lead-free.

Q. How much lead does milk contain?

A. That varies.

Q. With what?

A. With the length of time that the milk has been in that container, with the type of food that that—

Q. What container, doctor?

A. Glass container.

Q. Are you saying that the lead gets into the milk from the glass container?

A. I believe so, yes, sir. I can take water and put it in a glass bottle, distilled water, and that water after a number of days shows traces of lead.

2105 Q. What have you done with your glass bottle before you put the water in it?

A. It has been washed out with distilled water first.

Q. Rinsed out with distilled water?

A. Rinsed out with distilled water, yes, sir.

Q. That is the only treatment that you gave it?

A. Yes, that is all.

Q. Where was it before it was rinsed out?

A. I couldn't tell you that. It was probably around the laboratory for weeks or so before it was rinsed out or it may have been one that was just used a day or two before, with milk contained in it and then used for this experiment.

Q. How would lead get on to the glass milk bottle?

A. Lead is a substance that is found in all cheaper forms of commercial glass. It is not found in the pyrex or chemical glass. It is and in glazes, in chemical work, in enameled ware.

Q. Is glass porous, doctor?

A. No, it is not, in the usual sense of the word, of course.

Q. Would you explain how the lead that is in the glass gets inside of—

A. That is a matter of solvent action. The glass 2106 is slightly alkali.

Q. Wait until I finish, doctor, please. Will you read the question so far, Mr. Golding?

(Mr. Schaefer's last question was read as recorded.)

Mr. Schaefer: Q. (Continuing.) —gets into the liquid which is placed in the glass bottle?

A. The glass as it is fabricated into bottles contains lead, and water or other things take up this lead in traces of definite amounts that we can estimate in milligrams.

Q. Now, after the bottle has once been rinsed, will the liquid put into the bottle continue to take up lead from the bottle?

A. Yes, it will continue to take up lead.

Q. Where will that lead come from?

A. It comes from the inside of the coating of the glass. There is a little silicate formed there.

Q. How does it get out?

A. It is a sodium silicate that breaks up and liberates the lead. Probably some lead silicate with the sodium silicate.

Q. What do you mean by a lead silicate?
A. The lead is there. We put lead in glass. We put manganese in glass.
2107 Q. No, I want to know what a lead silicate is.
A. It forms with the silicon oxide when it fuses.
Q. What does a lead silicate look like, doctor?
A. White.
Q. Is it visible to the naked eye?
A. In the form of the amount there, it is not visible. It is transparent.
Q. It is transparent?
A. It is transparent. It is just like your glass, part of the structure of that glass. Sodium silicate is water-white also and in thin portions it would not be discernible to the eye, until it is dry, but if it is fused into glass you would not notice it at all.
Q. What tests have you employed to determine the presence of lead in glass bottles?
A. The Fairhall method.
Q. What is that?
A. And I have used the dithizone method.
Q. Describe that method.
A. Fairhall is the method I have used in reporting on lead cases in court.
Q. Will you describe that method?
A. Yes, I will be glad to go into it in detail.
Mr. Rall: How do you spell the other method?
2108 The Witness: The other method is the dithizone method. That is the colormetric method.
We will start with 1000 cc. of water or urine. Let us start with urine. Make it more difficult. To this 1000 cc. of urine in a silica dish, fused silica dish, we put 15 cc. of nitric acid. Evaporate this to dryness and ash it.
The nitric acid oxidizes the organic matter in the urea and sometimes goes off with a flash, due to sudden combustion of the organic matter.
Then you take it up with distilled water, after it is cooled. Add hydrochloric acid and tartaric acid, so if there are phosphates present the phosphates will not interfere with the lead determination. It will break up any calcium phosphates that might be present.
The acid is completely neutralized, after it has been filtered from this incineration process. It is filtered into an Erlenmeyer flask and neutralized with sodium hydroxide. To it there is added an indicator, such as methyl orange.

We now pass in hydrogen sulphide, this gas being obtained from sulphide of iron, to which 1 to 7 sulphuric acid is added. That is dilute sulphuric acid.

2109 Before it is passed into this solution, while we are trying to find out whether lead is present, it is washed through water and passed into the unknown solution.

The lead sulphide will precipitate. It may be in very small quantities so that you can hardly see it. Any iron that is there will also be taken down as a sulphide.

This is filtered off through a filter paper, washed with warm water, and dissolved and washed through into another Erlenmeyer, by means of nitric acid, 1 to 1.

The nitric acid is now boiled, to free this second filtrate from hydrogen sulphide.

It is then taken up with more water, usually 50 cc., neutralized again with sodium hydroxide, until it is alkaline.

It is then acidified with strong acetic acid, and at this point one-half cc. of a 10 per cent potassium chromate, normal chromate, is added.

This solution is now boiled for several minutes, covered and allowed to stand over night, so that the lead will have an opportunity to be precipitated as lead chromate, a difficultly soluble substance.

2110 This is now filtered off through a very small filter paper, washed with warm water, and when found to be free from chromate by using dithizone solution we add hydrochloric acid, 5 to 10 cc. of 1 and 1 strength, washing the material into a third clean Erlenmeyer flask.

To this is added 1 cc. of a 20 per cent potassium iodide solution, also a few drops of hydrochloric acid. In the presence of lead a blue color will be obtained.

This is now titrated with an N/200 normal solution of sodium thiosulphate, and a blank is run using all of these re-agents as enumerated above, and the blank is subtracted from any titration that we may obtain in the unknown.

The Master: Off the record, please.

(Discussion off the record.)

Mr. Schaefer: Q. When you get through, what determination do you have?

A. The determination of the lead.

Q. In what?

A. In that sample of water.

Q. In that sample of urine you started out with.

The Master: Just a minute.

Mr. Schaefer: Will you read the question that I
2111 asked the witness? It is quite aways back.

(The record was read as follows:

"Q. What tests have you employed to determine the presence of lead in glass bottles?

"A. The Fairhall method.

"Q. What is that?

"A. And I have used the dithizone method.

"Q. Will you describe that method?")

Mr. Schaefer: Now I move the answer be stricken.

The Master: He is telling you what he did.

Mr. Schaefer: That isn't what I asked him. What I am asking the witness is how he determined the presence of lead in glass bottles. He is telling me how he determines the presence of lead in urine.

The Master: Do you have any different answer than what you stated, doctor?

The Witness: I stated what I thought was a proper answer. If the attorney, young attorney here, will just clarify what he wants—

Mr. Schaefer: Let us just cut that out. If the Master please, I resent that.

The Master: You don't have to tell us whether the attorney is young or old. You can answer the question.

The Witness: He had it read to him, sir. Why have it repeated?

2112 The Master: You have no right as a witness to chide or take the lawyer to task. Now, you can just answer the question. What is the question now? You asked him how he determined the presence of lead in glass bottles?

Mr. Schaefer: That is right.

The Master: Now, is the answer that you gave the answer you would give to that question?

The Witness: The answer is exactly the same. The procedure would be the same.

Mr. Schaefer: Q. Now, applying that—

A. I have not finished yet. Do you want me to finish it?

Q. Applying that procedure, doctor, what you determine is the lead content in the material which is placed in the bottle, is that correct?

Mr. Rall: I am going to object. If the witness is not permitted to finish the answer to the question, which was

for him to describe the method, counsel ought not to be permitted to proceed, unless he withdraws the whole question.

The Master: Well, let the record stand as it is made now. What is the question now?

(Mr. Schaefer's last question was read as above recorded.)

2113 The Witness: A. That is right.

Mr. Schaefer: Q. Now, what I want to know, doctor, is how you determine the lead which you have described as being contributed from the glass bottle to the liquid placed in that bottle.

A. Well, the same method, using the same chemical procedure.

Q. You have said that by that procedure you determine the amount of lead in the material placed in the bottle?

A. Yes.

Q. Now, how do you determine what percentage of that lead came from the bottle, if any?

A. By taking this same unknown and evaporating it in a platinum dish or in a silica dish which is free from lead, and running that as a blank.

Q. When did you perform such tests with respect to glass milk bottles?

A. I have been doing that for years and years.

Q. For what purpose?

A. Determining the lead content of foods and foods stored in glass.

Q. What I am interested in now, doctor—and this is all I am interested in—is the contribution of the lead

2114 from glass bottles to the liquids placed in those bottles. That is all I am interested in.

A. I have so answered you.

Q. Now, what tests have you performed to determine what amount of lead, if any, is contributed from glass milk bottles to the contents of those bottles?

A. Applying this same procedure which I have just given you.

Q. When did you perform those tests?

A. I have performed them off and on for the last twelve or fifteen years.

Q. And for what purpose?

A. To determine blanks on samples that came in for

the determination of lead. I not only used milk bottles, but used gallon bottles, brown bottles.

Q. As I understand you, doctor—perhaps we do not understand one another—as I understand you, you are saying that what you have done over a period of years was done in an effort to determine the lead contact of certain substances?

A. That were stored in certain kinds of receptacles.

Q. And specifically glass milk bottles?

A. Well, I have had glass milk bottles as one of them.

2115 Q. I am interested just in glass milk bottles.

A. Yes, I see.

Q. And your purpose in doing that was to determine how much lead was contributed to the milk from the glass milk bottle?

A. Yes. Because I got samples of urine from glass milk bottles and then I found lead in them, and then I would have to run a blank with distilled water to see how much came from the bottle itself.

Q. But you don't know what was done with the bottle before the urine was put into it, do you?

A. No, I do not.

The Master: Q. Have you done that more than once, doctor?

A. Oh, yes, I have done that repeatedly.

Mr. Schaefer: Q. Now, doctor, I want to know what tests you have performed to determine whether or not once the bottle is rinsed out it continues—rinsed out so that the liquid in the bottle as it comes from the bottle is entirely free of lead—what tests have you then performed to determine whether or not another liquid not containing lead will pick up lead from the glass bottle?

A. I was only interested possibly in two or three different fields. I was not interested to see whether
2116 sodium hydroxide in milk bottles would pick up more lead, if that is what you are referring to.

Q. No, that is not what I am referring to at all. That question was perhaps not clear. What I want to know is how many times you have prepared a glass milk bottle so that it was free of lead.

A. Never could do that.

Q. What?

A. Never could do that, because it would always have lead.

Q. How many times have you tried to do it?
A. I could not tell you how many times.
Q. Did you ever try to do it?
A. Absolutely.
Q. Now, doctor—
A. What do you think I am telling you here? A bunch of falsehoods? I am a research man.
The Master: No, he is just asking you questions.
The Witness: Yes, but I don't want him to try any insinuations like that.
The Master: He is not making any insinuations.
The Witness: "Did you ever try it?" What do you think I am telling you here?
The Master: He is just asking you and you can tell him.
2117 The Witness: Certainly.
Mr. Schaefer: Now, Mr. Golding, will you read the last question before the witness' most recent outbreak?
(The question referred to was read as follows: "What I want to know is how many times you have prepared a glass milk bottle so that it was free of lead.")
Mr. Schaefer: Q. Now, what I want to know now, doctor, is the procedure that you employed in attempting to prepare a glass milk bottle so that it was free of lead.
A. I could not do that.
The Master: Q. Let us put it this way. You put in some distilled water to wash it out?
A. Yes.
Q. Just how carefully did you wash it?
A. It will always take up some lead again.
Q. The water would?
A. Yes.
Q. How long would you let this distilled water remain in the bottle?
A. As long as the fluid contained in it had been submitted to me. If the fluid had been in there seventy-two hours, then I would run a blank seventy-two hours.
2118 Q. What do you mean by a blank? Just an empty bottle?
A. You take this bottle. Suppose it contains 800 cubic centimeters of urine. I don't know whether all of that lead in that urine came from an individual. Some of it might have come from the glass container. That is not only milk bottles, but other bottles.
Q. Yes.

A. It will do the same thing. So we allow the same amount of fluid to stay in that container.

Q. Distilled water?

A. From the time the party submitted it to us, and they say this was in this bottle twenty-four hours. Then I am only satisfied with distilled water staying there twenty-four hours, and then I run that right through this process, and it may show a trace and it may show—

Q. The idea is to make a comparison?

A. We have to subtract the amount of lead from this particular container.

Q. Now, the distilled water would not contain any lead?

A. No. It is distilled.

Q. You put that into the glass bottle?

2119 A. That is as free as far as possible.

Q. And you permit that distilled water to remain in the glass bottle the same length of time that the—

A. That the unknown was in that same condition, whether it is a milk bottle or another kind of bottle.

The Master: Does that answer your question?

Mr. Schaefer: Pretty well, yes, sir.

Q. The tests that you have described then or that you have referred to were your control blank tests?

A. That is the blank test. We have to run those on everything that comes in.

Q. I thought you testified on direct examination that everything contained lead. Did I misunderstand you?

A. Practically everything does contain lead, as you say. The water that you are drinking every day has got lead in it. If you drink beer, it has got lead in it. If you drink whisky, it has got lead in it. If you drink wine it has got up to 124 milligrams of lead per liter of wine. So there is hardly a thing that you can touch—oysters, grains, —everything has got lead in it.

Q. Now, this distilled water to which you referred, however, does not have any lead?

A. It does not have any lead that we can deter-
2120 mine by the Fairhall method. Using the dithizone method, which is a more delicate test, it might show the presence of some metal there, because it is frequently distilled from metal. That is why we do not use the dithizone method on metals, because it gives the results from other metals here, like a host of metals, unless it is especially carried out.

Q. That is, you cannot segregate one metal from another?

A. Yes.

Q. I don't know whether I got your figures correct on your direct examination or not, doctor. You said that normal people in the Chicago area eliminated 9/100 of a milligram from a liter of urine?

A. That is the maximum we find in students and other people not engaged in lead industries.

Q. Now, the other figure I was not sure that I got right is this: You said, as I understood you, 1 milligram or .1 of a milligram per liter in urine would indicate—

A. Absorption of lead.

Q. Would indicate absorption of lead?

A. Yes. From one-tenth of a milligram.

Q. Per liter?

A. Per liter of urine, yes.

2121 Q. Then your margin is—

A. Only one hundredth of a milligram, yes. Most of them in this area run near eight hundredths, but occasionally we find one that runs nine hundredths, so we have to use that figure.

Q. Now, will you describe the way these ink offsets to which you referred in your direct examination appear under the microscope?

A. They do not appear like the ink that I said the stenographer is using. Can I have your paper here, Master?

The Master: Yes. Take a plain sheet.

The Witness: Take one liter. There are innumerable little dots. They are all microscopic. Wherever he has taken this pen there is a deposition of pigment, under the microscope. Now, with this other we do not get these fine dots.

The Master: Q. What other?

A. With the linseed oil inks.

Q. Which was used on these containers?

A. Yes. We get these things in little shining particles. They are not little dots. Some of them will be very small, like this, but many of them will be confluent, or where they have run together. So then you get a form
2122 that you consider more of a smear under the microscope than this other would be.

Mr. Schaefer: Q. Regular or irregular?

A. Oh, they are irregular. Some of them are very

fine. Some of them are made of particles one hundred times the size of these small particles. In other words, it would be like a daub of your ink being pressed on there and squashed out, in contradistinction to these little dots here.

Q. Would it be entirely flat under the microscope?

A. No, it is raised.

Q. Raised uniformly?

A. No, it is not.

Q. It is irregular?

A. It is irregular. Anything that is stamped is irregular. Look at your hazor blade and you will see a saw tooth edge on it that will surprise you under the microscope, where as if you look at it with your eye it is perfectly smooth. That is the way it is with ink.

Q. Now, in answering Mr. Rall's question as to the health hazard to a person drinking milk from the hypothetical container which he described to you, you based your answer that there would be no health hazard upon the insolubility of the ink and, hence, upon the im-
2123 possibility of the lead in the ink getting into the milk?

A. On the insolubility of the lead linolate, lead pigment, getting into the milk, yes. You see, it is covered over by this film of linseed oil and it is also covered by a film of your paraffin. Both of these things are insoluble in fresh milk.

Q. Now, let us assume as you did in responding to Mr. Rall's question, that the application of paraffin has not, for some reason, been effective. Then your answer is based entirely on the insolubility of the ink in the milk, is that correct?

A. Yes.

The Master: Q. Which is it? Of the ink or of the lead?

A. The insolubility of the ink, the ink being made of this pigment, whether it is manganese, cobalt or lead.

Q. That is, no part of the ink would be soluble in the—

A. In the fresh milk, no.

Mr. Schaefer: Q. The lead is the pigment, is it not?

A. That is only part of the pigment.

Q. The oil is the vehicle?

A. The oil and the gums are the vehicle and they
2124 usually have a coloring matter in there. Sometimes it is lead chromate or it may be other things that are

used for color. Where it is green or red, they might use an iron. Those are called the pigments.

Q. Now, assume that that offset in the rough, irregular form in which you have described it, gets into the milk by means of handling the container, by means of friction, or by any other means, in insoluble form. Would that be beneficial to the health of the person drinking the milk?

A. From the offset, in the amount you refer to?

Q. Yes.

A. You are talking about the inside, under the worst possible condition, as exhibited here today. I don't think enough lead would come off there, if it was all scraped off, to do any harm.

Q. What I asked you, doctor, was whether or not it was beneficial to health.

A. Lead taken in is not beneficial, in my opinion, in any form. Whether taken in in food, wine or anything else, it is going to be deposited in the bones. It may cause no ill effects at all.

Q. Now, I will ask the other question: Is it disadvantageous to the health of the individual who
2125 drinks that milk?

A. I know of no ill effects coming from people consuming foods containing one hundred or more milligrams, up to four hundred milligrams a day of lead, as is found in our foods, since I have said that all foods would contain some lead.

Mr. Schaefer: Now, will you read the question to the witness?

(Mr. Schaefer's last question was read to the witness as above recorded.)

The Master: Q. Apply to that the amount of lead that may be found in this offset.

A. That would be very much less, from the appearance of the offset on the inside.

Q. Do you have any idea as to the amount of lead if the printing itself were on the inside of the container?

A. No, I have not any idea how much those letters would contain.

Q. Would you say it was up to this one hundred or four hundred milligrams you were just talking about?

A. The whole amount there?

Q. Yes.

A. Could I have one of these and cut it and I
2126 could tell you more. Give me one that is not an exhibit.

(Witness cuts into a carton.)

This is the one that contains the most lead, as I understand, contains 30 per cent of lead.

Q. You mean the ink?

A. The ink contains 30 per cent of lead. I think if all of this ink in here were to be put in a—

Mr. Schaefer: Referring to the printed surface of the container?

The Witness: A. (Continuing.) —platinum dish—

Mr. Rall: Referring to the outside or obverse of a flat blank similar to Plaintiff's Exhibit 91.

Mr. Schaefer: Printed side.

Mr. Rall: Printed side.

The Witness: A. I think this would contain a hundred milligrams, easily, if this were all oxidized. If we could just remove all of these letters as is and subject it to a chemical examination, we could tell. There is quite a little pigment segregated here, although it is a very thin coating. The coating is microscopic in size.

The Master: Q. It is what?

A. The coating is microscopic in size. It is very thin.

Q. All of this ink, or as much of it as could be
2127 rubbed off into the milk, you say would contain less than a milligram of lead?

A. I think it would contain close to a hundred milligrams. It might be a little bit more. The bands are quite heavy on the bottom there and they are wide.

Q. Would you consider that a detrimental to health?

A. No. I could take a hundred milligrams of lead, and probably do, and probably all of us do take several hundred milligrams of lead every day in our food.

Q. Would you say that would be injurious to an infant five months old?

A. Nothing so insoluble as this; I doubt whether it would hurt anybody. It is only when it becomes soluble and enters the blood stream. If you got my definition of a poison this morning, a poison is a substance which, when it enters the blood stream and acts chemically is capable of seriously affecting health or causing death. So this stuff would have to go in solution. I could give you a teaspoon full of barium sulphate and it would not hurt you at all, but if I give you a teaspoon full of barium chloride, another salt, I could kill you. It is the
2128 solubility of these things that makes them act as poisons.

Q. Even though that may not be soluble in the milk, can that become soluble in the system?

A. No, I doubt very much if that would become soluble. I think most of this would be eliminated as a lead salt by the gastro-intestinal tract in the feces.

Q. Let us assume now that this lead in the ink on the container would amount to, say, six hundred milligrams?

A. And it were soluble or insoluble?

Q. No, also insoluble. And it got into the milk and were consumed by a person. Would that lead, six hundred milligrams, or even a thousand milligrams affect the health or be detrimental to the health of that individual?

A. When you get up into large figures like that, yes, because there might be some of this lead—I don't know what form they use, outside of the lead oxide. They may use a litharge. A litharge is slightly soluble in gastric juices and intestinal juices. But the form of the lead in a linseed oil preparation is difficultly soluble, and I think that would be eliminated unchanged.

Q. Even though you have a thousand milligrams?

2129 A. Ninety-eight per cent of it would be eliminated unchanged, because its solubility is only about 2.3 per cent in gastric juices.

Q. Let us assume you had a thousand milligrams in a container of milk and an infant less than five months old should consume some of this milk; would you say that would not hurt the infant in any way?

A. It depends on how much went into solution.

Q. That went into solution in the body?

A. That went into solution in the body, yes, sir.

Q. It would not go into solution in the milk?

A. No, sir.

Q. Then the mere fact it is insoluble in the milk does not indicate that it may not be partially soluble in the gastric juices?

A. No, sir. Some of it might go into solution in the hydrochloric acid and gastric juices in the stomach, which I know does happen, and also in the bile. But in dog experiments, where I used lead acetate, a very soluble substance, I recovered over 94 per cent of the lead found in the urine and stool. Those experiments covered over a year's time. Metabolism cases.

Q. Would you say then, a thousand milligrams of lead contained in this sort of ink, in a container of milk,

2130 and fed to a baby less than five months old, might or might not cause injury?

A. It might, yes. A thousand milligrams is a lot of stuff. That is one gram or 15.45 grains. It has a lot of foreign materials to put into a body of a baby.

Q. But a hundred milligrams, which you say is the amount contained here, would not cause any damage?

A. I don't think that would hurt, because we are taking that much in our food all the time.

Q. But a child?

A. A child is getting that in its dextrose maltose and in the milk it is taking.

The Master: Go ahead, Mr. Schaefer.

Mr. Schaefer: Q. Now, going back a moment, you said that normal people in the Chicago area eliminated nine hundredths milligrams per liter of urine?

The Master: In the weight.

The Witness: A. Nine hundredths of a milligram. .09.

The Master: The weight of the lead in a liter?

Mr. Schaefer: That is what I mean.

The Witness: That is the maximum normal.

Mr. Schaefer: Q. How much would that be in-
2131 creased to eliminate one hundred milligrams of lead?

A. How much would that have to be increased?

Q. Yes.

A. That would have to be increased many thousand fold to get a hundred milligrams. You see, if it is increased ten times we would have nine-tenths milligrams and that would have to be increased ninety-nine times, practically, in order to get a hundred milligrams of lead.

Q. Yes. Now, you had a margin, I understood you to say, of one-hundredth of a milligram between the indication of lead intoxication and the normal amount of lead eliminated in urine?

A. That is right. Anything over nine hundredths. That is the high normal. That begins to show manifestations of lead. But that has to be modified, too. I find people every now and then that have eighteen hundredths, twice that amount, and still do not show any signs of lead intoxication, no lead line, no gastric disturbance and no decrease in the lead count or hemoglobin. So there are exceptions to that.

I had a case just last week where double the amount was found in the urine, and the man was not suffering from lead poisoning. He happened to be suffering from a
2132 dysentery or food poisoning, but he was a painter, so we had to examine him to see if lead was a factor.

Q. But where you get double the normal elimination of

lead, without getting indications of lead intoxication, other indications, the occurrence is rather abnormal?

A. That is abnormal. Anything over .09, or 90 per cent of the cases where it is over .08 would give you that. In my book I give the figure of .08, but we have run a lot since that figure, and I believe now that .09 for Cook County and Chicago is probably the figure.

Q. Now, for a person to get rid of 100 milligrams of lead taken into the system through the mouth would require that volume of lead elimination to be increased substantially, wouldn't it? I think you said ten times.

A. You are figuring on urine, of course. All of that would not be eliminated by the urine. 90 per cent and over of these animals, 94 per cent was all eliminated by the stool.

Q. Doctor, when you testified to your figure of nine hundredths of a milligram per liter, you were not con-
2133 sidering the amount eliminated by the stool either, were you?

A. No, but we know it is eliminated all the same.

Q. So we know that we are comparable.

A. That person could have been taking two hundred milligrams of lead a day and that amount show in the specimen which we are taking into consideration.

Q. Now, doctor, assuming that lead from paper milk containers is taken into the human body in the manner I have described; will the effect be beneficial upon the health of the individual who takes it?

Mr. Rall: I am going to object to that question. There is no evidence here that any lead is taken into the human body from milk containers.

The Master: Overruled. Go ahead and answer.

The Witness: A. In what amount did you state?

Mr. Schaefer: Q. First, in any amount, will it be beneficial?

A. I know of no pathological changes in the human body from the normal consumption of lead from our every day foods.

Q. Translate it. That means—

A. In other words, it means that the lead we are taking in our foods, which would include this milk, does not exert a change in the liver, the kidney, the heart, the lungs,
2134 the stomach or the bowels.

Q. That is, you know of no beneficial effect?

A. I know of no pathological changes seen in the organs of some twelve thousand people whose organs I have

examined, and all of them were taking lead every day into their systems.

Q. Now, the effect of lead on the human body depends, I suppose, quite largely on the quantity taken?

A. On the manner in which it is taken. By the gastro intestinal route the effects are the least. By inhalation the greatest damage is done, because is it inhaled by the individual and does not go through the portal system and is immediately taken up in the blood, and goes to all the organs of the body and is deposited in the bones as basic tricalcium lead phosphate.

Q. And the quantity taken in is an important factor?

A. The quantity taken in is an important factor.

Q. Now, the total quantity of lead in the human body is one of the factors which determines whether or not that person will suffer from lead intoxication, isn't that correct?

A. That person, yes. If that person has absorbed a considerable amount of lead from his daily intake of food,
2135 which contains lead, and then he is subjected to insults of something that contains more lead, he is storing up lead in his bones that some day might come out with a rush and cause illness.

The Master: Q. Provided that this lead is taken in in soluble form?

A. It has to be in soluble form in order to get in the blood stream. It has got to go through the little ventricles and capillaries to get into the blood stream and then it is carried to all parts of the body and finally takes the place of the calcium in the bones and is deposited there as basic phosphate.

Mr. Schaefer: Q. Is an increase in the amount of lead taken into the human body desirable?

A. No. Lead is not a desirable factor, any more than arsenic or manganese. Any metal that does not enter into the metabolism of the human body should not be taken into the system, if we can prevent it, but in the form of food we cannot separate the lead from the food, from our beer, our wine, our drinking water.

Q. Now, doctor, when you determined the presence of lead in glass milk bottles, in what quantity did you find it?

A. That varied from traces, where distilled water
2136 had stood only over night, eighteen to twenty-four hours to water that had stood in similar bottles where 2.12 milligrams of lead were found in a thousand cc. This particular type of bottle was cloudy, showing that water had

acted on it or other things had acted upon the bottle itself. All milk bottles gradually become cloudy, or if water stands in them for some time you can find a ring formed at the top of this water. That not only applies to milk bottles, but other types of bottles. Even our best glassware will get a cloud in it where solutions have stood in it for some time, showing that the water and other substances in these bottles had acted upon the glass. Glass always has some sodium silicate present, and that makes it alkaline, and that alkalinity produced there dissolves out some lead.

Q. From what?

A. Dissolves. The alkalinity of that water from the sodium silicate dissolves out lead.

Q. From what?

A. From the glass itself, in the water.

Q. And the highest you found was what?

A. It was 2.12.

Q. What was the average?

A. Well, the lowest was a trace. If I run thirty
2137 or forty of these I would simply have to add up all of them. I could not give you the average, because I haven't got all of the figures.

Q. What do you mean by a trace? A measurable quantity?

A. No. Where we could not titrate it. But we knew there was a coloration, either by the dithizone method or by the Fairhall method, up to where I titrated enough in the end where two hundred solutions gave me 2.2 milligrams of lead, and that would have to be subtracted from the 1000 cc. of the unknown, in order to arrive at a proper factor.

Q. You do not remember now the average?

A. No, I would not remember it. That has been done over a period of years and I would not have the records back when we were doing that.

Q. Do you know of your own knowledge whether or not paraffined paper containers, like Plaintiff's Exhibit 2, are absorbent?

A. Absorbent in what way?

Q. Absorbent in any way.

A. Absorb anything?

Q. Yes.

A. You mean from the outside or inside?

2138 Q. Let us take from the inside first.

A. That had been thoroughly coated with paraffin?

Q. I didn't ask you that. I asked you about Plaintiff's Exhibit 2. Do you know of your own knowledge?

The Master: I asked him about that this morning.

Mr. Schaefer: Sir?

The Master: I asked him about the absorbent qualities this morning.

Mr. Schaefer: Yes, I know you did.

The Witness: I don't know, because I have not experimented with this particular exhibit.

Mr. Schaefer: Q. Now, is it not a fact, doctor, that any solid substance is undesirable in an inflamed bowel or intestine?

A. Any solid substance that could act as an irritant would be objectionable in a bowel that is undergoing any inflammatory reaction, like a mucus colitis, enteritis or dysentery.

Q. Would you say any solid substance could be irritating? Can any solid substance be irritating?

A Depending on the size. If we introduced flour into a bowel, it would not be irritating to the lower bowel, because it would be acted upon by the digestive juices. We in-
2139 troduce irritants to cover up these inflamed bowels.

We introduce bismuth, sub-nitrate and those things to cover up inflamed bowels, which in itself in large pieces would be irritating, but in the form of impalpable power is not irritating.

Q. Yes.

A. So if your paraffin was in real small particles, it would not irritate any bowel, but in large chunks, yes.

Q. How much are you being paid for testifying here today, doctor?

A. I don't know whether it is material or not.

Mr. Rall: Go right ahead.

The Witness: A. I charge my usual fee, one hundred dollars a day.

Mr. Schaefer: Q. Is that the fee you ordinarly charge?

A. Yes. In some cases I get twice that. Usually it is one hundred dollars a day.

Q. Do you spend a lot of your time testifying?

A. Not as much as I used to.

Q. Have you any idea how many cases you have testified in?

A. Many hundred.

Q. Many thousands?

2140 A. I don't know. Maybe it is thousands.
Mr. Schaefer: That is all.

Redirect Examination by Mr. Rall.

Q. Doctor, when you referred to large chunks of paraffin being irritating, can you give us a more particular description of what you mean?

A. If this one hundred grams that has been referred to was in one chunk—

Q. One hundred milligrams.

A. One hundred milligrams, which would be merely twice the size of a kernel of wheat, in my opinion that would be irritating. If it was in comminuted form, very small particles, no.

Q. You have referred to there being possibly one hundred milligrams or a little more on Plaintiff's Exhibit 91 of solid material in the ink. You were referring to the printed side and not to the inside, is that correct?

A. I was referring to the printed side, yes, knowing that someone had said this contained thirty per cent lead. The reason I know from an examination of the plates that that contained very much lead—I know that that is what
2141 it would be, about what it was. These transfers on plates contain lead, like calcium, bismuth. I have done work along that line.

Q. You say that the total quantity of lead already stored in the body from any source is a factor in the later cause of lead poisoning, if there is an increase?

A. Yes. If a person has a large amount of lead stored up in his bones, he may have no symptoms whatever, but when they use my method of eliminating that lead from the body they sometimes create a case of lead poisoning. Such an occurrence occurred at the Ravenswood Hospital. A young lady came in for an examination, and instead of giving her the ninety grains of potassium iodide, as my method calls for, the nurse gave it to her three days, a beautiful case of lead poisoning, because the lead was drawn out of her bones and thrown into the circulation in massive amounts, and she got a case of typical lead poisoning.

Q. Do infants under the age of one year ordinarily have stored up quantities of lead?

A. Not unless they have been chewing their cribs or

they have been subjected to lead nipples. Those cases
2142 are very rare. They do get it, but it is very rare.

Q. The number of times that a glass milk bottle has been put through the chemical solutions which are used to sterilize it might have an effect on the inner surface of the glass bottle, insofar as releasing lead is concerned, might it not?

Mr. Schaefer: I object to leading the witness, if the Master please.

The Master: Oh, I will let him answer the question.

The Witness: A. Yes, it would, because it offers more surface for the water to impinge on. For instance, if you take that piece of paper in front of you and you wrinkle it up or tear it into minute pieces, you will have a greater surface for water to act upon than if you had it right out flat. The same way with indentations on a bottle. If you punch a lot of holes in that bottle, which is virtually what the chemicals are doing, you have a greater surface for them to act upon.

Mr. Rall: While you were describing the Fairhall procedure, you were interrupted by counsel. Is there considerable more to the procedure?

A. We got down to the point where we were titrating
it, and to complete the method we titrate this with
2143 N/200 sodium thio-sulphate, until the blue color disappears. The blue color is due to the indicators in the iodine, and when we get to the point where there is no further color we subtract our blank from the amount we titrated and multiply that by .3451, which gives us the milligrams of lead in the unknown. That completes it.

Q. And those are the methods which you have used in determining the presence of lead in glass bottles?

A. Yes.

Q. And other food containers?

A. Yes, sir.

Q. You were asked to assume that 100 milligrams of lead, from a paper milk container, got into the milk from the printing. From your experience do you know of any instance of the situation so assumed?

A. I know of no intoxication from the lead from printing in containers such as you have exhibited here.

Q. If Plaintiff's Exhibit 91 were turned inside out, so that all of the printing on the outside of the container were next to the milk and the container was not paraffined, do

you have an opinion whether there would be any lead in the milk, if it were so handled?

2144 A. Yes, I have an opinion.

Q. What is that opinion?

A. I think there would be some lead in that milk.

Q. And in what quantity?

A. It would be very small, but there would be some lead.

Q. If the outside were turned in?

A. Yes.

Q. Would that quantity be within the range that you feel would have no effect on the human body?

A. Yes, it would.

Q. So, in addition to your answer being based on the insolubility of lead in milk, the quantity that might possibly get into the milk is also a factor, is that correct?

A. It always is a factor, yes.

The Master: Q. How would the lead get into the milk in such a situation?

A. That has not been brought out by either side, but I believe it would get in there in this manner; that wherever you have printing and you are handling large quantities of these things, there is a very fine dust gets onto the paper, and if I had my microscope here I could demonstrate that there is some dust coming off of them.

2145 Q. Coming off of the printing?

A. Yes, sir. Some dust coming off of that printing. So the expert cannot say truthfully that there would be no lead in that milk. It would not be from the solubility, but from the dust. If you go into a lithographing plant and see these things piled up—and I have made dust counts in these places—you can see this green powder on the floor, if they haven't swept their place. Or if you take an air sampling, such as I have, you can find that dust in the air where these men are working. When it is in that condition—of course, you are putting that to a very rigid test by putting that in. I would be willing to drink that every day, the way it is, out of these containers, but still there would be some lead in there.

Q. Is that the only way the lead would get into the milk?

A. Yes. It is insoluble in milk. It is insoluble in water, this particular pigment.

Q. Let us see if we get this straight. You said there was an oxidation film over the printing?

A. Yes.

Q. So that would prevent solution of the lead into the milk?

2146 A. Yes

Q. You say, however, there is a dust which might fall into the milk?

A. That would come if we would put it to the most rigid test, which would not do. These things, which are packed together, there is a little friction in here. It is microscopic. If I dusted this all off I might not find anything, because it has been exposed to the air. All you might find is silica, floating from the outside air in here. But there will be some lead come on. Up here there would be practically nothing.

Q. Referring to the offset.

Mr. Rall: Q. Referring to the offset on the inside of Plaintiff's Ehibit 91?

A. No, sir. Because that has been dried, and when that thing is pulled off there is an infinitesimal amount.

The Master: Q. Let us get back to this, doctor. You say, first, there is this oxidation film that would prevent solution of the lead into the milk?

A. That is right.

Q. However, you say there is a dust on the paper which would fall into the milk, without necessarily being in solution in the milk?

2147 A. Yes, but a person will get that if they drink it.

Q. How is that?

A. A person will get it if they drink that milk.

Q. Now then, Mr. Schaefer pointed out that the ink which constitutes the printing is not there in even layers, but may be there in ridges?

A. That is because I said under the microscope it would be discernible to the naked eye.

Q. Those ridges might be worn off a little bit, so as to make this dust, too?

A. Oh, that is so small. That is microscopic. It might be one three-hundredths of an inch.

Q. I mean, it would enter into this, being a source of dust?

A. Yes. Just the fact of rubbing these things, you can create dust, and a man piling that across like that, and he keeps doing that continually, he is going to raise a little dust, so if these things were not shaken down like that, probably they do get dust from the street and things like

that, so there surely would be some lead get into the milk, offhand, in that way, but not the other.

Mr. Rall: Q. And when you refer to it getting in
2148 in that way?

A. I mean if I made a test of that milk, without any previous tests, I would find lead in that milk.

Q. If it was so handled?

A. Yes.

Q. Under the severest tests, you still say there is no problem of health hazard involved?

A. Oh, no. From the way you have explained it to me, there is no health hazard.

Mr. Rall: That is all.

Recross Examination by Mr. Schaefer.

Q. Why would not dust come from the offsets, doctor?

A. That would be so infinitesimally small. This printing here would be—

The Master: The printing on the outside?

A. The printing on the outside would have several thousand times more of lead, expressed in milligrams or fractions of milligrams, then what I could get from here.

Mr. Schaefer: Q. But there would be dust, there might be dust on it?

A. It would be very small, because this is exceedingly small.

2149 Q. Of course, the amount of dust will depend upon the amount of printing, I suppose?

A. Yes. If you took all of the printing from these things and put it in the milk, you would have some lead there.

Q. But apart from the quantity, is there anything in the nature of offset as opposed to the direct printing—

A. No, this offset will be smoother.

Q. I haven't asked you anything yet, doctor. Let me finish my question.

A. Yes.

Q. (Continuing) —that would prevent dust from occurring from the offset?

A. Yes, because the offset is so infinitesimally small.

Q. I said, apart from the quantity.

A. Apart from the quantity?

Q. Yes.

A. No. You can get even pieces of paper from here, if they were not shaken or handled in that form, you would get some little dust.

Q. Then your answer is, apart from the quantity, there is no difference between the offset and the printing?

2150 A. There may be in quantity, yes, in marked quantity.

Q. Yes, but apart from that there is no difference?

A. Yes. Lead could come in, if there was dust on this side of the package, just as well as if I develop it on the other side. Dust will come from there, but not from the solubility. From the dust.

Mr. Schaefer: That is all.

The Master: Anything else?

Mr. Schaefer: No, sir.

The Master: One other question with reference to this distilled water standing in a glass bottle.

Q. You say after a while it might show some lead?

A. Yes.

Q. Is it possible that some of that lead might come through the air?

A. Well, we have the milk bottles all stoppered up and covered up with filter paper. They are plugged with cotton, and then we have a piece of filter paper, 15 centimeters in diameter, making a cap, so there is nothing coming from the air. But the air even in this room contains some lead.

Q. That is what I mean.

A. Yes, the air, every place has some lead in it, more down on the street than up this level.

2151 Q. But in making this experiment you did everything you could to prevent lead from the air coming into it?

A. Yes, because it was all done under the same conditions. The blank was run the same as the other.

The Master: Anything more?

Mr. Rall: No, that is all.

The Master: That is all, doctor.

(Witness excused.)

The Master: Let us have a short recess.

(A short recess was here had, after which the proceedings were resumed as follows:)

The Master: You may proceed.

Mr. Gariepy: Dr. Vaughan.

R. T. VAUGHAN, was called as a witness by the plaintiff, in rebuttal, having been first duly sworn, testified as follows:

Direct Examination by Mr. Gariepy.

Q. State your name?
A. Doctor R. T. Vaughan.
Q. And your address?
A. Cook County Hospital.
Q. You are a licensed physician and surgeon in this state?
2152 A. Yes, I am.
Q. How long have you been such?
A. Since 1904.
Q. What is your position at the Cook County Hospital now?
A. I am attending surgeon and night superintendent.
Q. And you have been there since 1904?
A. Since 1913.
Q. Are you acquainted with the procedures employed at the County Hospital now in cases, pre-operative cases on patients and post-operative cases, with regard to ordinary treatment?
A. Yes.
Q. Are mineral oils used in pre-operative cases?
A. Yes, very frequently.
Q. Is that a customary procedure at the Cook County Hospital?
A. Yes. Many services use that as ordinary preparation for operation. They use mineral oil and enemas, to insure an empty alimentary tract.
Q. How about post-operative treatment?
A. Yes. It is used post-operatively also, especially in rectal complaints, like hemorrhoids and fistulas, so
2153 as to insure a liquid soft non-irritating stool.
Q. How does that mineral oil compare with the commercial paraffin, such as is used on paper containers or food containers, doctor?
A. Well, it is derived from the same source as paraffin and it is essentially of the same chemical make-up.
Q. Does it contain alkali and acids?
A. No. It should be neutral to litmus paper.

Q. Is paraffin used in such cases as bone cavities by the surgeon?

A. Yes. Solid paraffin to fill out bone cavities and aid their granulation. It is used as bone wax.

Q. For building up places?

A. There may be a cavity in the bone and the bone often fills in with new bone, under a protective plug, of which paraffin is the base. Beck's paste and Morhoff-Mositing paste are two commonly used bone pastes, having a paraffin base.

Q. Is liquid paraffin also used in cases of treatment of hernia?

A. No, but solid paraffin is.

Q. How is that used?

A. Hernia is a hole in the belly wall and it is plugged in by injecting liquid paraffin. It is melted up by
2154 heating and injected, and solidifies at the body's temperature.

Q. You also, I think, said it was used in cases of hemorrhoids?

A. The mineral oil is used in cases of hemorrhoids. Mineral oil is a heavy, clear liquid, clear like water, whereas paraffin is a solid.

Q. What is the usual treatment given in cases of bowel obstruction, in diagnosis of bowel obstruction?

A. There is a lot of things given, but mineral oil is used in a diagnostic way. If the mineral oil comes through and appears in the enemas and in the stools, we know obstruction is not complete.

Q. How does this mineral oil compare in quality, doctor, with regard to alkali and acids, with the paraffin that is used on commercial containers, such as this white paraffin?

A. They are both neutral in reaction.

Q. Have you made any inquiry, doctor, with regard to treatment of babies, the history of disease in babies, to ascertain whether there is any case of record wherein babies have been fed that have a diseased or irritated intestinal tract by reason of any paraffin or mineral oil?

A. No. The effect of paraffin is just the opposite.
2155 Paraffin is emulsion. Paraffin, vaseline, mineral oil, are all used as sedatives, as protective agents. A great many protective unguents have a paraffin base.

Q. What about the oil we use in our nose to resist infection?

A. Vaseline has the same base. It is half way between paraffin and mineral oil. White petrolatum and white vaseline that you get is usually made by mixing paraffin with mineral oil and bottling it up and mixing it up.

Q. And that white paraffin is used by the surgeon in what instances, doctor, in treatment?

A. Well, it is used for different purposes. The hard paraffin is used, as I say, to fill out hernial depressions. It used to be used a great deal more than it is now, because it retains a certain fluidity and does not stay in place very well. It is not used now nearly as much as it used to be. It was also used for burns, sprayed on as a liquid, with or without some mild antiseptic, and thus protected the burn from the exterior world. Most services now use tannic acid.

Q. Instead of paraffin?

2156 A. It gives a preparation that is a little heavier and forms a firmer coat than does the paraffin.

The Master: What was that last?

The Witness: Tannic acid. It turns limbs brown.

Mr. Garjepy: Q. Does this white paraffin permit penetration of bacteria, doctor?

A. Permits penetration?

Q. Yes.

A. Well, bacteria won't go through a layer of paraffin, if that is what you mean.

Q. Yes.

A. But bacteria next to the skin will not go out very easily, such as the elimination of pus, paving the way.

Q. It seals it in?

A. It does not seal it in. The fact is paraffin is so pliable that it easily enables secretions to come through. We also use dressings soaked in paraffin, because the pus comes through the mesh quite easily, and then the absorbent dressing put outside of that can be changed without disturbing the surface of the wound. That is what we call paraffin gauze. That is hard paraffin. It has been used for subcutaneous injections, for cosmetic defects, for

2157 dimples and depressed scars and depressed noses. It is injected into the tissues while warm, and the paraffin has to be used at a melting point sufficient low so that it does not produce a burn. It is generaly heated up to about 120. You have got to have paraffin which melts around 120. 130 will burn, although it is a very mild burn.

Q. And these paraffin dressings that you refer to are dressings that are put right next to the open skin, after injury?

A. Right next to the open wound, you mean?

Q. Right next to the open wound.

A. With the skin taken off of it, yes.

Q. Now, the procedures that you refer to, doctor, are employed at the present time by physicians and surgeons at the Cook County Hospital and by the Cook County Hospital?

A. Yes, although I understand most of the services are using tannic acid now in preference to paraffin. During the World War paraffin, a French preparation, known as amprene, was very popular and used on the Western front, before the tannic acid treatment was extended up in Detroit.

Q. The American Medical Association has passed upon the precedures and techniques employed at the Cook
2158 County Hospital, for approval or disapproval, haven't they?

A. They have a book or list of accepted remedies that are approved for use everywhere.

Q. And are these remedies and these procedures and these techniques you refer to generally approved by medical science?

A. Oh, yes. The preparations are in the U. S. Pharmacopoeia, where the U. S. Pharmacopoeia states the uses and values of preparations.

Q. Did you attempt to ascertain from any pediatricians, doctor, with regard to their experience and findings in children under five months old being afflicted in any way by reason of the taking of any paraffin into the intestinal tract?

A. No, I know of no instances of paraffin in the intestinal tract doing any child any harm.

Mr. Gariepy. Cross-examine.

Cross-Examination by Mr. Schaefer.

Q. Now, doctor, this mineral oil to which you testified, which is used in pre-operative and post-operative treatment, is that in liquid form?

A. Yes.

2159 Q. Do you ever use undissolved paraffin in pre-operative or post-operative treatments?

A. No, because you usually use the liquid, because of the greater readiness with which liquid spreads over a surface. Vaseline has been used for the same purposes, but it does not flow quite so easily and most people prefer to take mineral oil to taking vaseline.

Q. Yes.

A. But the chemical reaction and the chemical properties are essentially the same. There is just the difference in melting points.

Q. Now, have you ever heard of administering undissolved paraffin to infants under the age of one year, for any purpose?

A. No. Mineral oil or vaseline would be preferable. The paraffin would not liquify in the body and therefore would not spread over the whole intestinal surface. It would go through as a foreign body.

Q. Are you a pediatrician?

A. No. I am a surgeon.

Q. And do you think yourself competent to testify as an expert with respect to matters of pediatrics?

A. Within limits, because I do pediatric surgery.

2160 Q. But, apart from pediatric surgery, do you consider yourself competent to testify as an expert?

A. I am not a trained pediatrician. Of course, I have had more or less experience with children, but I am not a pediatrician.

Mr. Schaefer: That is all.

Mr. Gariepy: That is all, doctor.

(Witness excused.)

Mr. Gariepy: With the exception of the depositions, everything else is in.

The Master: Do you want to show proofs closed, outside of the introduction of the depositions?

Mr. Gariepy: Yes.

Mr. Ralf: As a matter of fact, at the close of the plaintiff's case in chief we did make an offer of the depositions and they were received, subject to the Master's ruling on the written objections which Mr. Schaefer was to attach.

Mr. Schaefer: That is right.

The Master: Then let the record show proofs closed, with the exception that Mr. Schaefer may present his objections to portions of the depositions or such portions as he may see fit to object to.

Proofs closed.

2161 • • (Caption) • •

Stenographic report of informal conference had at the office of United States Master in Chancery Jacob I. Grossman, Suite 753, United States Court House, Chicago, Illinois, at 11:00 a. m., Saturday, March 9, 1940.

Present:

Mr. Fred A. Gariepy and Mr. Owen Rall, representing the plaintiff;

Mr. Walter V. Schaefer and Mr. Charles P. Horan, representing the defendants.

The Master: I read over the briefs in this matter some time ago and some questions have occurred to me. One thing I have already mentioned to you gentlemen, as to whether this suit in the court at this time may be a little premature. My thought is this:

It seems to be agreed that the subject of milk containers is proper to be included in an ordinance, that health measures concerning milk which affects municipalities gen-
2162 erally first receive the consideration of the United States Public Health Service, that the Public Health Bureau has framed a model ordinance, which has been followed by municipalities generally, and that whenever a change is to be made in general practice concerning milk usually the United States Public Health Service is the first to consider and pass upon the change.

In this matter it appears that the United States Public Health Service has been investigating the subject of paper milk containers for some time and has made suggestions concerning that type of container, and finally the Bureau has made an amendment to its model ordinance.

While this suit was pending the Board of Health of the City of Chicago learned of the amendment, and, following the usual course, promptly recommended to the City Council that the ordinance be amended so as to follow the recommendations of the United States Public Health Service. The City Council Committee has the matter under consideration.

That all seems to be the usual course. The evidence has been introduced in this case, but of course the
2163 Council Committee or the Council itself would be free to consider any kind of evidence, whether it be strictly

admissable in a court or not. There are many considerations entering into the passage of an ordinance which are not strictly admissible in a court proceeding.

The Council Committee has stated that it will defer consideration of this question until after the court has passed upon the matter. I have been wondering whether the correct procedure should not be the reverse, that the Council Committee should be the one to first pass upon this, rather than the Court.

That question in my mind opened up a rather broad field. For instance, we can imagine that over a period of years various questions such as this have been decided by legislative bodies, so that statutes or ordinances may have resolved questions in controversy from time to time by inserting in the legislation a statement that a particular thing or process or something else should be used.

Now, let us imagine that some inventor decides that he has perfected a device or process, or whatever it may be,
which is superior to the thing mentioned in the ordi-
2164 nance. Ordinarily we all know it takes some time for
a new device or process to stand the test before such a thing is adopted generaly. For instance, we recently heard of the magnanimous act of some doctor who said that he had found a medicine which could be put on the teeth to take away all unpleasant sensations attendant upon the dentist grinding the teeth, and he dedicated that discovery to the profession and people generally. I am told that the dentists went after that with considerable enthusiasm, but in a short time they decided that the new thing was not exactly what its inventor promised. I presume he was about as much disappointed as the dentists generally. So I say it takes a little time for a new thing of that sort to stand all of the tests necessary, and it takes some time for it to percolate into legislation.

Now, if every inventor could immediately run into court and demand that the court hold a hearing on his invention and decide that that invention is what he claims it to be, the effect would be that the usual procedure would be
changed and the usual tests to which the thing must be
2165 put before it is generally adopted would not have to
be used any more.

That is just a brief statement of the broad question that is involved. In other words, should legislation be permitted to follow its natural course, or should the courts interfere

and upon the suit of any inventor immediately tell the legislative body that their existing legislation is invalid and virtually mandamus them to pass a new set of regulations, or that the court will simply permit this new device to be used? Should the courts undertake what is essentially a legislative function that early in the game?

I was wondering whether a more accurate statement would be that the ordinance does not yet permit, and that is something that is more in harmony with the actual facts in the case. That is to say, if you discover something new, naturally it would not be the subject of any ordinance and it was never in contemplation at the time the ordinance was passed. The question is whether you are going to give the legislative body an opportunity to permit the use of the new device. And the ordinance does not yet permit, because the legislative body has not had the opportunity in the regular course that I have described to permit the new device.

2166 I have stated this rather generally. I have talked to you both, and you get my general idea. I thought I would ask you that.

In connection with that same subject, this thought occurred to me: Assuming that the courts should hold that this ordinance is too narrow and that these containers should be permitted, can the court order a permit without machinery therefor?

The thought that I have there is that in the existing ordinance there is provision for regulating the use of the glass bottle, namely, there are provisions as to cleaning the bottle and for inspection right along.

Now, if the ordinance is invalid as to plaintiff, does it necessarily follow that a court should say, "Well, you go ahead and use these paper containers, even though there is no system of regulation whatever."?

It may very well be that the particular containers presented in this case may not be subject to objection, but is that an assurance that future containers, manufactured even by the same plaintiff, would be sterile, or essentially sterile, as you put it, or that the conditions under which the bottling is done would remain the same?

2167 In other words, in the case of bottle cleaning there is a continuous regulation. The mere fact that there is an inspection, say, today does not mean that the cleaning process is going to remain exactly the same for a year.

There is a periodical examination, so as to keep them observing the regulations.

No, if the ordinance is invalid as to plaintiff, does it necessarily follow that it is invalid as to glass bottles? That is a question I have in mind also.

There is some suggestion in the brief of the City which gives rise to this question: Does the glass milk bottle, the so-called standard milk bottle, give the purchaser an opportunity to see whether the milk is dirty or not, whether there is any dirt in the bottle? What is there in the ordinance to the effect that the glass milk bottle is not required in order to prevent fraud; in other words, to give the purchaser an opportunity to see what he is getting?

The statement in the brief of the City which gave rise to that was the one about the cream line. A purchaser might look at a glass bottle and see whether there is a
2168 cream line or not. He would also see whether there is dirt in the bottom or something floating around.

Of course, you might say in answer to that, "What about the can of condensed milk? You cannot see what is in that." I heard of a case, or somebody mentioned a case about a can of condensed milk, where they found a foreign body in it, and suit was filed.

Mr. Rall: They found a mouse. That was in the Circuit Court of Appeals.

The Master: That is the case. They sued them. But that goes back to the other question: Is this glass milk bottle something for the benefit of the purchaser, so he can see into the bottle before using it? There might be something else floating around.

Stating specifically the question I first raised, you both seem to agree that this ordinance prohibits the use of paper containers. When I say that, I am passing your contention that the ordinance is broad enough to permit the use of paper containers. But after you pass that first contention, you say that it does prohibit.

Now, there is another question I marked down, about absorbency. At first the plaintiff in its brief possibly got out on a limb when the contention was made
2169 that there was no absorbency. The City in its answering brief pointed to some evidence which showed there was absorbency, and then, as I understand it, the reply brief conceded that there might be some slight absorbency, but so slight that it could not be considered as material.

Therefore, is it necessary that there should be inspection so as to insure that there will not be more absorbency than the amount that is present now, even though it may be immaterial at the present time? For instance, one batch of containers would not necessarily be the measure for the next batch. There might be a change in the method of manufacturing. As I have said, there might be a change in the method of cleaning glass bottles. That is why they have a system of inspection that periodically requires an examination of the method of cleaning.

Should the court grant relief, which would practically be a mandamus to enact a system of regulation? You see, the first question in that connection is: Should the court first say that the ordinance is invalid, and then throw the whole thing open for the use of paper containers,
2170 if the court realizes that even if paper containers are permitted there should be some system of regulation or check to see to it that even if such containers are all right under the evidence now, they will be in the future?

That raises the other question. If there has to be some system of regulation, should the court, if it says that these containers are all right, be required to enact a code for the regulation of the use of these containers as incident to its decision that these containers are proper? In other words, is the court going to assume legislative power? Should the court go ahead and say to the community that these paper containers are all right, and while the court knows that they may be all wrong in six months, if the same safeguards are not followed and observed, yet the court simply will not do anything more? Or would the court in a case such as this say that while these things may be permitted that the court might, as an incident to granting relief, require certain safeguards? And if it should do that, would not the court really be passing an ordinance by itself, a regular system of regulation, in order to make its relief effective and yet safe?

2171 If the court should say that the plaintiff's containers in evidence are all right, I suppose that that would not necessarily include other paper containers; each paper container would have to stand on its own evidence. The effect would be, as I noticed in the contentions of the City here, that the plaintiff would have a monopoly of paper containers, because other companies would either have to bring a suit or wait until an appropriate ordinance

is passed permitting paper containers, and they would all have to qualify.

The other question I have is: What kind of an order would you want the court to make? That is all suggested in what I have said.

Mr. Schaefer: I think each of us can answer that, but the answers will not be the same.

The Master: Well, that in general is what occurred to me. The principal thing I talked about was this question of the court's waiting until the City Council should be given an opportunity to act upon it or whether the court should go ahead and let the City Council say that it will wait for the court to decide what is essentially a
legislative matter. The practical effect of all this
2172 would be that if the City Council would pass on it,
the City Council would do it within the reasonably near future, and the City Council might pass an ordinance permitting the use of paper containers. On the other hand, if the matter is allowed to remain in court, there is no telling when the litigation might be ended. It might take you several years before the whole thing is finished, and then you might have to go to the City Council after all.

Now, it is just as important from the standpoint of the plaintiff as of the defendants to decide just what the correct procedure here is. If this thing remain in the courts and the City Council stands on the sidelines, it will just remain in the court for a while, and then after you get through you may not be further along than you were in the beginning.

As I worded this question originally, the court has to look at the jurisdictional question itself, whether either side raises it. While this may not be strictly a jurisdictional question, it is a question which is in the nature of a jurisdictional one: the propriety of the court doing anything in a matter that is essentially legislative, and
2173 even if I go ahead and decide every single issue that
you have presented or even if the District Court does it, some upper court may, on its own initiative, say that this is a legislative matter, and throw the whole thing out and put you right back to where you were in the beginning.

I thought I would put that question up to you, because it seems to me to be important to both sides. If there is a short way open and it may decide this one way or an-

other and present this very narrow question, maybe that is the way to go. I know at a previous stage of these proceedings there was a time when it seems to me that both sides had decided to pass up the Master's hearings, and we did not have any hearings here for a month or two, when it seemed that the Council was going to pass upon this matter immediately. It seemed to me that both sides then thought that—

Mr. Schaefer: Both sides did not. We never did.

The Master: I mean the Board of Health, when it passed this resolution; then it seemed to me, at least, for a time, that there was some prospect that the City Council might act upon the matter. Proceedings were suspended, I know, at that time.

Mr. Schaefer: No proceedings were possible at
2174 that time. The question there was, when the plaintiff filed its brief, the plaintiff delayed in filing its brief.

The Master: We will put it that way then.

Mr. Schaefer: But the hearings were continued.

The Master: Then we will say the plaintiff thought that possibly the City Council might do something.

Mr. Gariepy: No, the plaintiff did not have any thoughts at all, because the plaintiff had waited three years for the Board of Health to take this matter in its teeth, and when on October 26th it took this action the plaintiff had the right to assume that the Board of Health was going to make some suggestion to the City Council to do something, since it was the guardian of the public health. Apparently the plaintiff or the public or the Master or counsel for the defendants were all mistaken, because the Committee said, "We will wait until the court passes upon it; we will not do anything until the court passes upon the legality of this subject." And there is our status.

The Master: Now, the question is whether the Council's Committee should decide this legislative question itself at the present time or whether even if the court
2175 should go ahead and decide, the Council Committee would have to decide it at some future time. In other words, the court might say that so far as the evidence here is concerned the plaintiff is entitled to something, but it is all the legislative question, and it depends upon the City Council after all to pass the regulations which might be necessary, even if it should be proved that this particular batch of containers would pass muster. I

have suggested the question, the mere fact that you have some proper containers here now does not necessarily mean that future containers, even manufactured by you, would be the same, so that there might be some justification for an inspection measure to be passed which would be operative in the future, so as to see that what you started out with would remain about the same.

Mr. Gariepy: We can all agree, Master, that the court and the Master will not tell the City what regulations to establish, but the court can pass upon the legal questions presented here without prejudice to the right of the City to set up such suitable regulations as will protect health.

That is the burden of the City, to go ahead and es-
2176 tablish those regulations to protect public health, the same as they did with the glass bottles. They got regulations to take care of that, and they ought to have regulations to take care of this. But standing by and waiting for something to be done and saying wait until the court does something I don't think is doing us any good. The court stands by and the Committee adjourns sine die and so on, and we just wait.

The Master: Have you any thoughts on this general subject that are more concrete than that? You said you had some memorandum that you might present on it.

Mr. Gariepy: The contention of the plaintiff is that the Court should pass upon the question with regard to the validity of the ordinance concerning the containers coming within the ordinance or whether the ordinance kicks the containers out or prohibits the containers from being used. That question can be decided without prejudice on the part of the City, the defendant, to establish or set up reasonable rules and regulations, such as the United States Public Health Service has already suggested and set up in their model ordinance. The City can set them up or adopt those concerning the matter of control of containers,
2177 paper containers, in the same way as they have regulations now concerning the use of the glass bottle. If they have one, they ought to have the other. There isn't any reason why the regulation should not be established. That is the beacon light the United States Public Health Service has shown them, and it has taken some action to give them the road to follow. I don't think the Master or the court should tell them just what the regulations should be, but they should be those reasonably to protect and conserve public health.

The Council started a hearing over there, and then stopped. There were several months of talk and argument. The question was raised as to who the Public Health Service was. Some of the members of the Committee didn't even know who they were. They asked Dr. Bundesen, I think it was, who they were, and what functions they had. The Doctor explained that they had always followed their lead and their action in October was to continue to follow their lead. He has always been of the opinion that the Chicago Board of Health had safe guidance in following their lead, and a witness for the City here said they got considerable force and backing and prestige in
2178 following their regulations in adopting regulations and ordinances from time to time.

Now, if they did that in the past and got their help in the glass bottle matter, there is no reason why they should not get that same help in the paper matter and why the suggestions they set up in Section 10 should not be considered in this same matter.

I think the Court's province is not in the field of legislation. That would be prejudicial to the right of the City to establish and set up such regulations as the City sees fit and necessary to protect health. That is as far as the court can go. I think counsel will agree that it has no right, nor has the Circuit Court, nor has the Superior Court, to say that this regulation shall be adopted or that regulation shall be adopted.

The Master: We have discussed, I think, in this case, at one stage or another, whether the City might object to paper containers on the ground that it could not effectively regulate them. Namely, they contend that the paper mill is frequently in a distant state, that there might be some things getting into the paper container or the
2179 paper or in the process of manufacture over which the City should have some regulatory power. There has not been anything said in the brief about that subject.

Mr. Schaefer: On the contrary, Master.

The Master: What is that?

Mr. Schaefer: On the contrary, there has.

The Master: About regulating at a distance?

Mr. Schaefer: Yes.

The Master: Of course, there is evidence to the effect that it is not necessary to regulate the first process of manufacture, because all bacteria are dead by the time that

you get to the paraffining process, which is always a local matter.

Mr. Schaefer: Yes, and there is testimony to the contrary.

The Master: The testimony, or one bit of testimony, is that there may be in the wall of the container dead bacteria, and if there is any substantial amount of absorbency the dead bacteria might get into the milk and set up a serum. That is Dr. Arnold's testimony.

Mr. Schaefer: No, I do not agree with you, Master. I don't know whether you noticed it or not, but no-
2180 where in the brief do I refer to Dr. Arnold's testimony. I refer to the testimony of Dr. Sanborn.

The Master: What does he say?

Mr. Schaefer: I don't have it spelled out here, but I refer to the page.

The Master: What, generally, is your proposition?

Mr. Schaefer: Generally, Sanborn says the sanitary condition of the paper mill is of the most important factor in the manufacture of paper containers, and so do the others say that.

The Master: On what page of your brief is that?

Mr. Schaefer: From pages 45 to 47. Dr. Sanborn testified to this, as I recall; that in his opinion, in the interest of public health, standards governing the production of paper board for use in paper milk containers and governing the subsequent processing and handling of that paper board until the container is filled with milk should be formulated, adopted and enforced by public health authorities.

The Master: Would your position be that in no circumstance, no matter how perfect a paper container might be made to appear, would it be proper to market such paper container, because of the fact that the City does not have any jurisdiction in, say, the State of Massachusetts?

2181 Mr. Schaefer: No, that would not be our point. Our point would be this: whether an ordinance is valid or invalid, on the grounds that are involved in this case, depends upon whether or not there are differences between the permitted product and the prohibited product, which are reasonably related to the public health. Here is the difference. The sanitary condition of one container can be ascertained—and this we set forth in our brief—can be ascertained by control at the spot where the con-

tainer is filled with milk, and the testimony of plaintiff's witnesses is that you can produce a sterile container by control there.

Now, we cannot—of this I am convinced—we cannot be forced to permit a container which has a different characteristic, that is, there is a difference which is reasonably related to the public health. The one you can control at the time it is filled with milk; the other you cannot. From the testimony of plaintiff's witnesses there is a difference which squarely relates to the public health.

Here in our brief we have quoted Dr. Prucha on the inspection of mills:

2182 "Milk sanitarians should inspect paper mills and check on the pulp."

The Master: What page is that on?

Mr. Schaefer: Forty-six.

The Master: Yes.

Mr. Schaefer: And we refer to Dr. Sanborn all the way here. And here is a long quote from Prucha. It is all there. The argument is not that we have not any police power in Massachusetts at all. We will worry about that if, as and when the legislative body wants that. I would not take the position that we did not have. There are decisions that say we do not. I would not concede that those decisions are sound law and I do not concede it. I those decisions are sound law, then we have no right to inspect the plant of the plaintiff here at all. If *Rockford* v. *Hay* is the law of Illinois, and I don't think it is, and all of us agree on it—but I am not talking about that. I am talking about the differences in these products that are related to the public health. Now, one is absorbent, one is not absorbent. You don't need to go beyond that difference, it seems to me. There is a difference there. And when a difference exists, the legislative body makes

2183 the choice. The same thing applies to transparency.

The Master: Your position is that the City Council could enact an ordinance providing for inspection and hire the inspectors to go out to Massachusetts to inspect and that if a container is to be permitted to be used in Chicago the container people would have to grant access to its plant in a distant state, if the paper container company wanted to have its container used in this city, is that correct?

Mr. Schaefer: Well, I do not have to take a position on that now. That might be my position if that time came.

My point is that we cannot be compelled to permit the use of an article that requires, on the testimony of plaintiff's witnesses, a different type of inspection.

Now, on these other things—while I am talking I might as well go through these things that have been running through my mind—there is, I think, a pretty profound misconception of the United States Public Health Service and its relation to the Chicago ordinance, and that exists pretty generally. Everyone says we have the United States Public Health ordinance. Actually, the out-
2184 standing characteristic of the United States Public Health Service ordinance is one that we do not have. That is that the United States Public Health Service has two grades of milk, Grade A and Grade B, and their system of enforcement is by degrading milk.

The Master: By degrading?

Mr. Schaefer: That is right. If a Grade A man fails to comply or if a Grade A farmer fails to comply, he is made a Grade B farmer and his milk is sold as Grade B, where, while it is not spelled out in the ordinance, there is a price differential. So if a dairy fails to comply, they simply refuse to let them sell Grade A milk and they sell Grade B milk. So you can see what happens to their customers.

That is the outstanding feature of that ordinance. That was the novel thing in the United States Public Health Service ordinance. The City of Chicago did not follow that. And there is a number of other places where we departed substantially from the United States Public Health Service ordinance.

You said the usual course was to follow the United States Public Health Service ordinance. That is not so. We follow that or not as the City Council and the
2185 Board of Health see fit. The United States Public Health Service is simply and solely an advisory body. We follow that no more than we will follow the recommendations of the University of Chicago or the University of Iowa or any other body.

The Master: Let us put it this way. When I say follow, I mean in point of time usually the lead is taken by the United States Public Health Service, is it not?

Mr. Schaefer: No, I don't think so.

The Master: What is that?

Mr. Schaefer: I would not go that far. For illustration, we have been requiring the use of Grade A cream for

the manufacture of ice cream in the City of Chicago for years. Now in the future the United States Public Health Service is going to require the use of Grade A cream in ice cream, but they do not require it now.

The Master: Let us put it this way. In some matters the lead is taken by the United States Public Health Service, and that is a very persuasive influence on the municipalities as to whether they should or should not adopt a particular measure, that sometimes particular measures may not be adopted by the municipalities until the
2186 United States Public Health Service recommends them. I say particular measures. Some measures. In others the City may not wait upon the United States Public Health Service, but in some cases, if there is some doubt about them or if the municipality for any reason does not feel like adopting those measures, then the United States Public Health Service takes the initiative and says they are all right; whereupon, on those particular instances, the City may follow their lead.

So without making a general statement as to all matters, that the Public Health Service takes the lead and the municipalities wait upon them, I say as to some matters that is the case. I think you will agree to that.

Mr. Schaefer: Oh, yes, I agree with that, because that does not—

The Master: I say, it is part of the practice in this health legislation.

Mr. Schaefer: There are about four hundred cities that make any effort at all to follow the United States Public Health Service. The vast majority of eight hundred thousand or I don't know how many hundred thousand cities make no pretense of following the United States
2187 Public Health Service. Now, actually—well, this is way off the record, so I won't go into it.

The Master: Well, isn't there some evidence here by Dr. Bundesen that that is the practice?

Mr. Schaefer: It does not make any difference, anyway. Dr. Bundesen's evidence is there for what it is worth. Whatever I say is not evidence, any more than what Fred said a few minutes ago.

The Master: Dr. Bundesen said that has been the practice here, and now that the Public Health Service has said it, he says it.

Mr. Schaefer: But you know, as a matter of law, what effect the United States Public Health Service has.

The Master: It has no effect.

Mr. Schaefer: Of course.

The Master: But I am talking about practice now. The only evidence in the record now, as far as I know, is Dr. Bundesen's statement.

Mr. Schaefer: I don't want to quarrel with what is in the record. If that is in the record, all right.

The Master: Am I right on that, Mr. Gariepy?

Mr. Gariepy: That is right, Master. He said he objected to the use of the paper container in the city
2188 until the United States Public Health Service had recognized it, and as soon as he found out that they had recognized it he brought the matter before the Board for attention.

The Master: And didn't he also say that that was the usual practice in this city?

Mr. Gariepy: That is right, he did say that. He also said before the Special Council Committee that they followed them in the past.

Mr. Schaefer: That is not in the record in this case.

Mr. Gariepy: He said in the other room, on cross examination, that as soon as the Public Health Service had seen fit to recognize this, he recommended that the City of Chicago follow that practice, that he did that in the past and has continued to do so.

Mr. Schaefer: Whatever is in the record, is in the record.

The Master: Have you prepared anything on this question?

Mr. Schaefer: Yes. On this question of a new device, it occurred to me now, while you were talking this morning —it had not heretofore—that you must consider legislative non-action as the equivalent of legislative action. I
2189 think the two are almost precise equivalents. I had not thought about this before and I have not thought it through, but it seems to me there is the answer to the particular problem that is bothering you. I think legislative action and non-action are synonymous. That is, non-action is the same as affirmative action the other way.

And I think there is no doubt of this: A police regulation which is valid today may, because of changed conditions, economic or otherwise, become invalid tomorrow, and there are cases so holding, the leading one being Chief Justice Hughes' opinion in that *Abie* v. *Weaver*, which in-

volved a Nebraska statute requiring banks to contribute to a state fund to insure their deposits. That went to the Supreme Court and its constitutionality was sustained. When the depression came along, it was found that the fund was not actuarily sound, that is, it was not adequate to insure deposits. This case that I just referred to went to the Supreme Court, and while the statute escaped invalidity, because the state had provided another method of liquidating, still the inference is unmistakable that the court would have held it bad even though it had theretofore held it good, and the Chief Justice said so.

2190 The Master: What is the citation on that case?

Mr. Schaefer: 75 Lawyers' Edition, 691.

There was a rent case that came up after that first group of emergency rent cases in Washington in the District of Columbia during the War. The first group of cases sustained the rather drastic regulations. Another case came along involving the Chaselton Apartments, or some such building, and the regulation was held invalid, the conditions having changed.

Mr. Rall: And another case is that of the Louisville & Nashville Railroad, a grade separation case.

Mr. Schaefer: That is right.

Mr. Rall: Where the Tennessee statute requiring an equal division, the railroad was sustained, and about ten or fifteen years later the same statute, applied to changed conditions, was held, in the opinion of Justice Brandeis, because of the changed conditions, to be unconstitutional in its application. I can send over the citation. But we agree, I think, as to the general rule, that the court will consider that this ordinance is reenacted every day that the City fails to make a change in it.

Mr. Schaefer: I think so. It is a continuing piece of legislation. I am going to think about that a little

2191 bit. It is an epigrammatic statement.

The Master: You may go ahead.

Mr. Schaefer: One thing that may be significant as to the City's position is that a question rather like this one came up before Judge Sullivan in the two cases that were before him, and he asked for briefs on this question, whether since the thing involved was an ordinance of the City of Chicago the demands alleged by the two complainants to be made upon the president and members of the Board of Health were of any significance or whether a

demand should have been made upon the City Council to change the ordinance.

In our brief there we took the position that the allegations as to any demands were superfluous, that they could be disregarded, that the validity of the legislation could be questioned without any precedent demand at all. That has been our attitude. Certainly I agree with Fred that neither you nor the court can prescribe regulations.

The Master: Neither can?

Mr. Schaefer: That is right.

The Master: But should the court do something that is not effective for the purpose?

2192 Mr. Schaefer: That goes to the way you decide the case, it seems to me, and not to whether or not you have the power to prescribe any regulations.

The Master: I am asking that now. I have to assume that the court's order can be effective. If the court should say that the plaintiff is right, what effect would it have?

Mr. Schaefer: Well, take this case. A statute in Illinois prohibits crimes against children, sex crimes against children. It was held invalid. A man who had been indicted under that statute and found guilty escaped punishment. The policy of the court and the common sense of the court would tell them that some punishment was necessary for that offense, and yet the court, the legislation being invalid, did not hesitate to hold it invalid on the ground that with that statute invalid there was no punishment for that particular crime.

That is just an example that leaps into my mind, and that happens often. Suppose the workmen's compensation legislation is held invalid. The mere fact that the court may think legislation on that subject was highly desirable does not influence the court one way or the other in

2193 deciding the question of validity. I think that what the court has to consider is simply that bare question of validity and invalidity.

The Master: Let me put it this way. You said in your brief that this whole matter is a legislative question, that this is all a question of legislative discretion.

Mr. Schaefer: That is right. If there are differences, it is a question of legislative discretion. If there are no differences—

The Master: All right. You say it is a question of legislative discretion. Now you say this whole subject of

regulation of milk containers, glass or otherwise, is a matter of legislative discretion. If that is the case, how do you reconcile that with your statement that the Court should decide it

Mr. Schaefer: The validity of the legislation is now being attacked upon the ground, in substance, that the legislation discriminates against the paper container. My point is this; that so long as there are differences that are related to the public health, that is a legislative question. If there are no differences relating to the public health, then the ordinance is discriminatory and invalid.

2194 Here is a case a good deal like it. Take that Marysville Oil Tank case that was cited, the Gasoline Tank case, where the ordinance of the city required gasoline tanks to be below ground. The oil company, whichever one it was, brought in evidence to the effect that they have stored oil above ground in this municipality and others, and there has been no harmful effect, and so on. But the court found there were differences in sustaining the requirement that gasoline be stored below ground. They would not have had to worry, it seems to me, in deciding that case, about whether regulations for the storage of gasoline above ground were necessary or not.

The Master: Have you prepared any memoranda on this thing that you want to leave with me?

Mr. Schaefer: I have not, no, sir.

The Master: You just looked up those cases to which you referred?

Mr. Schaefer: Yes, I will give you those. There are one or two others.

The Master: Is there anything more you want to say?

Mr. Schaefer: There is this that I want to say. I want to urge you to read the testimony referred to here. I did not set it out, because I did not feel it was right

2195 to set it out, but it is there and it is in the plaintiff's testimony.

Mr. Rall: The plaintiff's answer is probably so conclusive to that point that your Honor has not looked at the other.

The Master: As I say, I read the briefs. I have not studied the record.

Mr. Rall: If it is true the City contends that in order to have adequate inspection and adequate control they must go to the paper mill, our contention in that regard is that

the very witnesses who talked about inspection of paper mills testified that the City had just as much control by means of inspecting the product after it got here in the case of paper as in the case of glass.

It is true that if you find contaminated paper, in order to trace it to its source you might have to go to the paper mill, but the City is not interested in tracing the source of it. The City is interested in the negative thing of stopping it. If it has got the power and the means at hand for stopping it, it will be up to the people to see that their containers are kept uncontaminated.

The Master: Of course, I might say one thing.
2196 You gentlemen seem to try to draw a parallel between paper containers and glass containers which does not exist. There has been frequent argument on the point of, "Well, why can't you go ahead and examine the manufacturing plant of the glass bottle?" I would say that it is not necessary to do that, because we all know that glass is made under such extreme heat that no bacteria could be there. So that the only form of regulation which suggests itself is to see that the bottle, after it gets here, is clean and kept clean. So that that is a form of regulation that they have there, that of bottle cleaning.

Now, then, in the case of the paper containers, which are used only once, you do not have to have any cleaning, after they are here, but there the regulation which suggests itself is to see that it is clean when it gets here.

Mr. Rall: That is right.

The Master: Now, that is the difference between the two. You argue in your brief that the amount of bacteria which may be in a paper container at the time that it gets here is no greater than that which may be found in a glass container after it has gone through the cleaning proc-
2197 ess. You say there is just as much bacteria or less in your container when it gets here and is used once as there is in the glass bottle while it is in the course of being used. That is the parallel you draw. I think that there is a comparison that may be the subject of some consideration.

Mr. Rall: On the point that is raised about the necessity of going to the mill, it seems to me that that is to be answered by determining whether or not there are tests after the paper containers reach the jurisdiction, so to speak, which will indicate whether or not they are contaminated.

It is our position that while the tests are different than they are for glass bottles after the glass bottles are cleaned, they are just as effective.

The Master: Anything else?

Mr. Gariepy: Adding to where your Honor left off, you spoke about just as effective. According to the evidence it is more effective and they are more severe tests. In other words, the mere fact that the paper container lends itself to a more severe test is not any reason why the paper container should be prejudiced or discriminated against, when the glass bottle in its rounds of use lends itself to exposure. As the City's own witness testi-
2198 fied, if they found anything wrong with the paper they could stop it, and all of the witnesses said they could stop it. In the same way they could stop the use of glass bottle or the rinsing or the washing process of the glass bottle at the dairy.

As far as control is concerned, there is no evidence in the record whatever that the City won't have adequate control, if they follow out the suggestions that have been followed by other cities. Witnesses here have told us that they have tried out those things for months and years. There is no evidence in the world that the City is going to be prejudiced or the public health in any way imperiled if they restort to these methods. The City has not shown that these methods are not sound and the tests are inaccurate. In fact, Dr. Arnold says these tests were true, but they were misrepresented.

Mr. Schaefer: No, he didn't say that.

Mr. Gariepy: He said he didn't agree with their reading of them.

Mr. Schaefer: Not about these tests. The tests you are talking about are the disintegration tests and the rinse tests.

Mr. Gariepy: Yes. But those are the only two
2199 tests on the containers. What other tests are there?

Mr. Schaefer: You misunderstand what Arnold was talking about. You were asking him about Prucha's experiments.

Mr. Gariepy: I asked him about both, the disintegration tests and the rinse tests.

Mr. Schaefer: The only way to get straight on that is to read the record.

The Master: What is the point you have on that?

Mr. Schaefer: The point I have on that is this. These

witnesses jumped all around on whether or not inspection was necessary. Sanborn was, I think, the only leading witness for the plaintiff. The plaintiff may disagree with me. They tried to get Sanborn to run away from his original testimony, that inspection at the mills was necessary. I have set out where he said that here in the transcript by reference. I have not repeated all of the testimony. He testified it was more expensive to produce sanitary paper than paper of a lower sanitary quality. Here is what he said about the disintegration tests and about the necessity of mill inspection. He said that while disintegration tests could be an index to the sanitary
2200 condition of manufacture in the paper mill he did not think it advisable, from a sanitary or public health point of view, to rely alone upon disintegration tests to determine the sanitary quality of the paper board.

Sanborn testified flatly to the necessity of mill inspection. Prucha wrote flatly that mill inspection was necessary for the purpose of determining—

The Master; Prucha said that?

Mr. Schaefer: I read it just a minute ago. Prucha in October, 1937, said this:—

The Master: In 1937?

Mr. Schaefer: (Continuing.) —"Milk sanitarians should inspect paper mills and check on the pulp."

The Master: They should.

Mr. Schaefer: All right, they should.

The Master: As I remember his testimony here, it was not to that effect.

Mr. Schaefer: Sure, he was running away from it. They were all running away from it, because they saw where it would lead to.

The Master: His testimony was that it would be immaterial.

Mr. Schaefer: To inspect that one mill.

The Master: Any mill.

2201 Mr. Schaefer: No, not any mill.

The Master: I remember asking him the question, whether it would be all right to manufacture this paper out of water from the Sanitary District channel. Sure, he said, it would be immaterial.

Mr. Schaefer: If you are going to consider that, read everything he has said.

The Master: That goes to his credibility.

Mr. Schaefer: Yes.

The Master: Your point is that Mr. Gariepy is mistaken in his statement that there is no evidence whatever in the record to the effect that inspection at the mill is desirable or necessary. You say there is such evidence in the record and it is supplied by the direct oral testimony of Dr. Sanborn and those writings of Dr. Prucha.

Mr. Schaefer: That is right.

The Master: Both plaintiff's witnesses.

Mr. Schaefer: That is right. Now, in addition, you seem to be under the impression that the record shows that these containers are more sanitary than the glass bottle.

The Master: I didn't say anything to that effect.

Mr. Schaefer: Then let me say that plaintiff's
2202 attorneys seem to be under that impression. Actually the record shows just the opposite. The only testimony here as to the condition of paper containers in actual use is of this fellow Woodman from the City of Evanston, who came down here and testified as to the rinse tests that he made on the containers right at the plaintiff's plant. There were about 101 of those, and there were about the same number on the American Can containers from the River Forest Dairy. Now, he testified specifically with reference to plaintiffs containers that 93 of the 101 examined had a bacterial count above the permissible maximum of 1,000. That is, seven per cent running above—

Mr. Gariepy: Who said that?

Mr. Schaefer: Woodman said that.

Mr. Gariepy: You are wrong.

Mr. Schaefer: I am not wrong.

Mr. Gariepy: Look at our reply. I quoted it in our reply brief.

Mr. Schaefer: I will ask Owen, did he say that or didn't he?

Mr. Rall: You said that he said that 93—

Mr. Schaefer: No, he said seven per cent.

Mr. Rall: You misspoke yourself.

2203 Mr. Schaefer: Oh, I am sorry. He stated that seven per cent were above the permissible maximum.

The Master: All right. I though you said 93.

Mr. Schaefer: That was my error. The actual count on the glass bottles does not show anywhere near that high. Those were actual counts in the City of Chicago. That is all the evidence there is on actual conditions. While he did not give us the specific information on the

other type of paper container, the American Can container, he did say they ran the same, and on that statement I did not ask him for the file he said he had with him. You asked if I was satisfied with that and I said yes, they ran the same. That is the evidence as to the actual conditions. That is not taking samples from somebody, going to the paper mill and disintegrating them. Those are things as they come from the dairy.

The Master: I will have too look at the briefs. Both of you have covered your positions. Now, if you will leave with me, Mr. Gariepy, that memorandum you have with you today, and if you want to submit your little memorandum as to those cases I will be glad to consider them.

I thank you very much for coming in this morning.

I just thought I would ask you these questions which
2204 were running through my mind. I think it has been helpful. You have brought some things to light.

Mr. Schaefer: Would you like oral argument on the whole thing?

The Master: I will read the briefs again and then if I think oral argument will be helpful I will let you know.

Mr. Schaefer: All right.

The Master: Now, off the record.

(Discussion had off the record.)

The Master: That will be all, gentlemen. Thank you for coming in.

(Whereupon, the conference was adjourned.)

2205 • • (Caption) • •

Stenographic report of discussion had at the office of United States Master in Chancery Jacob I. Grossman, Suite 753, United States Court House, Chicago, Illinois, at 2:30 p. m., Friday, April 26, 1940.

Present:

Mr. Fred A. Gariepy and Mr. Owen Rall, representing the plaintiff.

Mr. Walter V. Schaefer, representing the defendants.

The Master: I noticed in the objections of Mr. Schaefer that he raised some question concerning the record

in this case. In order to get that straightened out, I thought it would be best if we could sit down here and get a statement of record.

Now, I have made part of the record—or I am making a part of the record—the conference that we had here on March 9, 1940, comprising pages 2161 to 2204.

Mr. Schaefer: Well, if the Master please, I don't
2206 believe that the report of that conference should be a part of the record. It was denominated an informal conference.

The Master: By the reporter.

Mr. Schaefer: By the reporter, yes, sir, and by the parties, because, after that hearing was had, we discussed whether or not it should even be written up, and it was written up only for convenience of the parties. Such was my understanding.

There are statements there—when I got the transcript of that conference, I ran through it. I noted the remarks —my observations concerning statements made by you, Mr. Gariepy and Mr. Rall. There were a number of things —a number of statements made—which I did not challenge, because I didn't consider that the hearing was a formal hearing and to be a part of the record. And, also, there were statements made which were not evidence, made by the attorneys for the parties. Now, I made some; Fred made some, and Owen made some.

The Master: Just let me complete this: The point I am getting at is, that whatever has occurred in Court, is something of which the Court can take notice, and
2207 if that is so, a transcript of what occurred can properly be made a part of the record.

Now, if some lawyer made a statement which is not evidence, of course it has no greater effect that a statement made by him during the taking of evidence—the mere fact that the lawyer made the statement.

Now, I think, however, we can clear all that up today by an agreement as to the facts that you have in mind, namely, the things I am talking about are the facts with reference to the pendency of the ordinance before the city council, and the chronology that you referred to in this memorandum that you handed me yesterday, or the day before yesterday.

Now, I—

Mr. Schaefer: (Interrupting.) Could we take that up

first and see if we can obviate that report being part of the record?

The Master: Well, I don't think the report being a part of the record hurts anybody. I think it is rather clarifying on the position of the parties on this thing. It is the same as the briefs in some respects, and the only thing that
2208 you have in mind here is the dates when certain things occurred, and also whether certain things did occur.

Now, you have set that up—

Mr. Schaefer: (Interrupting.) And also the materiality or immateriality of those occurrences, and it seems to me it is quite one thing, when we are discussing a matter informally between us, as a matter of mutual discussion, and another thing to have that as a part of the record.

The Master: You are referring now to those occurrences before the city council committee?

Mr. Schaefer: Yes, sir.

The Master: Well, if they are agreed that the chronology that you have presented here is correct, you don't object to that going into the record, do you?

Mr. Schaefer: Only on the ground of immateriality as to the fact that they are the facts—I have no objection to that—but I cannot see, for the life of me, how it makes any difference.

The Master: Well, I think it does. I think, as I have stated in my report, the fact that the matter is pending before the city council, is something of which the Court may take notice, and may consider in disposing of
2209 this case. That is why I am trying to get the record straight on it. I have referred to that, and I think there should be some factual basis in the record, and that is what I am trying to clear up.

Now, off the record here a minute.

(Discussion outside the record.)

The Master: Let this be agreed, then, as to the chronological statement. I am putting it into my report, and it is going into the record by agreement:

In October of 1939, the United States Public Health Service amended its model ordinance to add paper containers (Plt's Ex. 92, Defts' Ex. 29, Rec. 1567). Thereafter, on October 16, 1939, the Chicago Board of Health recommended to the city council similar action. In the meantime, hearings in this suit had begun, and were being held at such times as expert witnesses from other states

could appear. The defendants' case was closed on October 13, 1939. On October 16, 1939, the Board of Health made its recommendations to the city council. On October 19, 1939, the defendants requested and were granted leave to reopen proofs and submit further testimony. Ac-
2210 cordingly, on October 23, 1939, the defendants offered further evidence, and again closed their case. The plaintiff completed its proof on October 26, 1939. The recommendation of the Board of Health was referred by the council to its committee on health. While the matter was under consideration by the committee, plaintiff's brief was not filed before me. On November 22, 1939, the committee on health voted to defer action upon an amendment to the ordinance pending the outcome of this case. Thereafter, briefs were filed in the case at bar, the plaintiff's brief on December 19, 1939, the defendants' brief on January 27, 1940, and the plaintiff's reply brief on February 15, 1940. Further proceedings were had in the case on March 9, 1940, the transcript of which is made a part of the record. Additional memoranda based upon those further proceedings were filed on March 15, 1940, and on April 13, 1940. On April 26, 1940, which is today, the record was reopened for the purpose of formally incorporating the above facts in this record.

Now, is there anything further that ought to go into this record? Is there anything that either side here
2211 has raised in the objections which go merely to the question of the record?

Mr. Gariepy: I have got one suggestion I would like to put into the record at this time, before we take up these suggestions that are filed by counsel and by plaintiff.

Within the last two weeks, it is a matter of common knowledge that homogenized milk is being sold in the City of Chicago, and being sold by and with the permission of the defendants. The Master, in his report filed here some 11 or 12 days ago, made reference to the matter of the cream line, and he made reference to the matter of the fact that the cream in the paper bottle became diffused, and did not concentrate or localize itself. The homogenized milk, by its very definition, is milk where the cream line is not observable, and where the milk is of the same quality throughout, or the cream is diffused throughout, so that it is one, continuous quality of milk from the bottom to the top.

If the city of Chicago and the Board of Health, the defendants, permit the sale of homogenized milk at this time—and homogenized milk is, as the name suggests, milk where the cream line is not observable, even in glass
2212 containers, and the cream is diffused equally and evenly throughout the milk—then the comment in the Master's report in his findings, and reasons therefor given, are of sufficient importance to the plaintiff for the plaintiff to ask leave at this time to offer proof that homogenized milk is now being sold, and has been sold, during the past 15 days, and was not at any time being sold during the pendency of this law suit before the Master, so we were not negligent or derelict in our duty in not presenting the point, and could not have presented it, since it was not a fact in being at the time. The Master has given those factors significance in his report, and I think we ought to be given an opportunity to meet them.

The Master: Do you agree that that kind of milk is being sold, or do you agree in the statement, Mr. Schaefer?

Mr. Schaefer: Well, I agree that homogenized milk is being sold in the City of Chicago without interference by any of the defendants. Homogenized milk, however, is being sold as such—labeled as such—and the homogenized milk which is being sold is required by the State Department of Public Health to be of such a quality, that
2213 samples taken from the top of the bottle, and from the bottom of the bottle 48 hours after the milk has been bottled, do not show a variation in the butter fat content greater than a small percentage of one per cent.

Mr. Gariepy: With regard to the State Board of Health, there is nothing in the ordinance on homogenized milk. Perhaps there would be something in the regulations of the Board of Health recently passed in the last 30 days to legitimatize the sale of this milk, so to speak.

The Master: At any rate, this homogenized milk is being sold, as Mr. Gariepy states, with the exception, as you state, Mr. Schaefer, that it is labeled and sold as such, isn't that right?

Mr. Schaefer: That is right, and that it meets certain requirements.

The Master: Yes. Is that agreeable with you?

Mr Gariepy: Yes.

The Master: So that the record now shows the fact with reference to homogenized milk.

Mr. Gariepy: There is nothing in the ordinance, you agree with me on that—

Mr. Schaefer: (Interrupting.) That is right, and there has been no regulation of the Board of Health.

2214 Mr. Gariepy: (Continuing.) —passed to permit its sale. It is just being done.

Mr. Schaefer: No, by virtue of state regulations.

The Master: At any rate, it is being sold; that is all we are interested in. We don't care how it is being sold, but it is being sold.

Mr. Schaefer: Yes.

Mr. Gariepy: In glass bottles—let's put that in, too.

Mr. Schaefer: Put that in my statement.

Mr. Gariepy: In glass bottles.

The Master: Yes. Now, is there anything further that is to go in the record?

Mr. Gariepy: You agree with my statement, also, Mr. Schaefer, that at the time of the trial that was not permitted, so we had no opportunity to go into that matter?

Mr. Schaefer: Yes, I agree to that.

The Master: Anything further?

Mr. Schaefer: To be added?

The Master: Anything further to go into the record?

Mr. Schaefer: No, sir.

The Master: Let the record show proofs closed.

Proofs closed.

2308 And on, to wit, the 24th day of May, A. D. 1939, there was filed in the Clerk's office of said Court certain Depositions, originals of which are in words and figures following, to wit:

2310 In the District Court of the United States.

* * (Caption—316) * *

(Filed May 24, 1939, Hoyt King, Clerk.)

Deposition of Paul V. Keyser, Jr., a witness in behalf of plaintiff, taken, pursuant to notice to take depositions served on the defendants April 15, 1939, at the office of Mudge, Stern, Williams & Tucker, 20 Pine Street, New York, N. Y., on Tuesday, April 25, 1939, commencing at

2:00 o'clock, p. m., before Irvin Taber, a Notary Public in and for the County of New York, State of New York.

Appearances:

Gariepy & Gariepy, Esqs., Attorneys for Plaintiff, by Owen Rall, Esq., of counsel.

2311 Barnet Hodes, Esq., Corporation Counsel of the City of Chicago, by Walter V. Schaefer, Esq., and Charles P. Horan, Esq., Assistants Corporation Counsel.

PAUL V. KEYSER, JR., a witness of lawful age, having been first duly sworn by the Notary Public, testified as follows:

Direct Examination by Mr. Rall.

Q. Will you state your name, please?
A. Paul V. Keyser, Jr.
Q. And where do you reside?
A. At 142 West 11th Street, New York City.
Q. And your business address?
A. Is 412 Greenpoint Avenue, Brooklyn, New York.
Q. And, for the purpose of the record, your age?
A. Thirty-two.
Q. And what is your occupation?
A. I am a chemical engineer.
Q. Connected with whom?
A. The Socony Vacuum Oil Company, Incorporated.
2312 Q. Is that sometimes commonly called the Socony Vacuum Corporation?
A. It is.
Q. How long have you been so engaged?
A. Nine years.
Q. And previous to that time were you engaged in any business or profession?
A. No.
Q. What briefly has been your education?
A. I graduated from M. I. T. in 1929.
Q. That is the Massachusetts Institute of Technology at Boston?
A. The Massachusetts Institute of Technology in Cambridge, Massachusetts.
Q. Yes, in Cambridge? And with what degree?

A. With the degree of Bachelor of Science in Chemical Engineering, and, in 1930, with the degree of Master of Science in Chemical Engineering.

Q. Previous to your entry into the Massachusetts Institute of Technology you had a high school course?

A. I had a high school education in Washington, D. C.

Q. And also a grade school education?

A. Yes.

2313 Q. At the same place?

A. At the same place.

Q. Now, you referred to a Master of Science degree. What additional schooling did you take which authorized the granting of that degree?

A. The course occupied one full year and followed the curriculum outlined by the Institute, which included advanced work in the general field of chemical engineering and a practice school which involved six months' training in various industrial organizations.

Q. And did that work follow without interruption your Bachelor's degree?

A. It did.

Q. And you then entered the employ of the company by whom you are now employed?

A. I did.

Q. What briefly has been your experience since entering the employ of the company?

A. I have been employed constantly in the general laboratories of the corporation.

Q. And where are those laboratories located?

A. Located at 412 Greenpoint Avenue, Brooklyn.

Q. How many men are now engaged in that laboratory?

2314 A. Approximately 160.

Q. In the laboratory?

A. In this division of the laboratories.

Q. State briefly what the business of the company is.

A. The company is in the petroleum business, and its scope includes the production, refining, and marketing of petroleum products of all types.

Q. Will you name a few of them?

A. Amongst which might be mentioned fuels, lubricants, processing materials such as waxes and so forth.

Q. Paraffin wax, I understand, is a product resulting from refining?

A. That is correct, of petroleum.

Q. Of petroleum. And where does your company manufacture—at what refineries does your company manufacture paraffin wax?

A. Paraffin wax is manufactured at our Long Island City refinery, amongst others.

Q. Do you know whether or not the paraffin wax manufactured at that plant is sold to the Dean Milk Company and shipped to Chemung, Illinois?

A. Yes, it is.

Q. Have you made an investigation to determine
2315 what the quality is of the paraffin wax so sold and shipped?

A. I have.

Q. Will you state what it is?

A. The paraffin wax manufactured at the Long Island City refinery and shipped to the Dean Milk Company is refined paraffin wax with a melting point of 125 to 127 degrees Fahrenheit, A. M. P.

Q. Is that capital A, capital M, and capital P?

A. Capital A, capital M, and capital P.

Q. What do those initials stand for?

A. American Melting Point.

Q. Are you familiar with the process of manufacturing this wax?

A. Yes.

Q. Will you describe it, particularly with respect to the sanitary conditions under which it is manufactured?

A. Yes. Paraffin wax is extracted from a distillate removed from the crude by distillation.

Q. When you refer to "crude" it is crude petroleum?

A. Crude petroleum.

Q. Crude oil?

A. Crude petroleum oil. Prior to the removal of the wax the distillate is treated with sulphuric acid to remove
2316 certain unsaturated bodies. It is then pressed, sweated, further treated with acid and washed with caustic soda, passed through a filter and finally molded into cakes.

Q. When you refer to "sweating", of what does that process consist?

A. The sweating process may be described as a fractional crystallization whereby the paraffins at the proper melting point are removed from the materials at other melting points and from the oil admixed with the wax at that point in the manufacturing operation.

Q. Can you tell us briefly how that sweating is accomplished?

A. The sweating is accomplished by introducing the slack wax, which is a mixture of wax and oil, into pans of rather large area but shallow, where, by a careful control of temperature, the law melting point of the material and the oil is selectively drained from the mass of solid crystalline wax.

Q. And that which remains is the paraffin wax that you are referring to?

A. That which remains after the sweating process has been carried out a number of times, over and over again, that is, is the paraffin wax. The wax, after a complete
2317 sweating operation, contains only a trace of residual oil, and this oil is completely removed by the final filtration.

Q. How is this filtration accomplished?

A. This filtration is accomplished by percolating the molten wax through bone black.

Q. Through what?

A. Bone black.

Q. Is that a substance?

A. Bone black is a very pure form of carbon.

Q. You speak about it being molded into cakes. Does that process occur after the filtration process that you have described?

A. Yes.

Q. Now, during the course of this manufacturing or refining operation is heat applied in the various stages?

A. Heat is applied in the various stages in order to—in the first place, to separate the paraffin distillate from the crude oil, and, secondly, to maintain the subsequent wax oil mixtures and eventually the pure paraffin wax in a molten state.

Q. Immediately prior to its being pressed into cakes what is the temperature at which the paraffin is maintained?

A. Approximately 160 degrees Fahrenheit.

2318 Q. Well above the melting point?

A. Well above the melting point.

Q. Of what materials are the machines made which are used in this manufacturing or refining process that you have described?

A. The entire system is carried out quite generally in

steel or cast iron equipment, all of which is enclosed, the process being in the early stages largely a continuous one.

Q. That is, without manual assistance the machinery does the work?

A. No human hand at any time touches any of the material throughout the operation or process.

Q. And does that apply to the entire process that you referred to?

A. It does until the cakes are finally—of the finished wax are finally removed from the molding machine and packed in suitable containers, which is a hand operation.

Q. And in what form is the paraffin wax that is shipped to Chemung, Illinois, by your company; that is, when it comes from the molding machine?

A. It is in eleven-pound cakes.

Q. And about what size are these?

A. Approximately sixteen inches by eleven inches
2319 by an inch and a half to two inches thick. That is the approximate size of the cake; I don't recall the exact dimensions.

Q. Now, you referred to that being removed from the molding machine being a hand operation. Do you mean that someone actually picks up the cake or lifts it from the machine, or just what is that process?

A. The cake is actually lifted from the mold and packed into a container.

Q. And just how is that process accomplished? When you refer to its being packed, are you familiar with the packing of this specific paraffin that we are discussing?

A. The paraffin is removed from the molding machine and immediately packed in paper-lined burlap bags.

Q. Right next to the paraffin is what?

A. Is paper

Q. Of what kind? Is it a wax paper or parchment of some kind?

A. It is a treated craft which is sealed to the exterior burlap bag.

Q. Is that paper kept under sterile conditions in your plant?

A. Yes, in so far as that is practicable.

Q. Just how is that accomplished?

2320 A. You have reference to the keeping of the container?

Q. Yes, of the container into which this wax in these eleven-pound cakes is packed?

A. Well, the bags as received are in sealed or closed packages, and they are kept in that shape in rooms wherein practices of cleanliness are observed, and these packages are not opened, nor are the bags opened up to receive wax, until immediately prior to the introduction of the wax into the paper container which comes in contact with the wax, being inside of the burlap bag.

Q. What is the practice with respect to the cleanliness of the operator who performs this operation of removing the wax?

Mr. Schaefer: Well, I object to that.

Mr. Rall: You may answer subject to the objection.

A. Why, the operators who remove the wax from the molds and place them in the paper containers are men who are regularly cautioned to observe good practices with respect to personal cleanliness and particularly to keep their hands free from dirt, and during the operation they do not handle any material other than the wax and the receiving bags.

Q. You referred to "good practices." Will you state, subject to the same objection that has been made,
2321 specifically what the instructions to these men are?

A. Good practice in our estimation involves regular washing of the hands with soap and water at specified intervals.

Q. Are these men who remove the wax under the supervision of a superior?

A. They are under the supervision of a foreman.

Q. Are you acquainted with the chemistry of the completed product that you have described?

A. I am.

Q. Will you tell us what its chemistry is?

A. Paraffin wax is substantially a mixture of crystalline, waxy hydrocarbons, characterized as being members of the saturated straight chain paraffin family best represented by the generic formula Cn H2n + 2 and having an average approximate carbon atom content of 24 to 28.

Q. Are there any regulations or formulae which describe or regulate the substance that you are discussing?

A. Yes. Those regulations include the specifications of our own corporation, and this wax is manufactured so as to meet the requirements of the U. S. Pharmacopoeia.

Q. Are the standards of the U. S. Pharmacopoeia published from time to time?

A. They are.

2322 Q. Are they published periodically?

A. To the best of my knowledge, at rather irregular intervals, depending upon the necessity for revision.

Q. That consists, does it not, of definitions of various types of substances, chemical definitions?

A. It does.

Q. Does that contain a definition of the paraffin wax, the substance that you have described?

A. It does, under the general heading "Paraffinum."

Q. You have before you a volume entitled: "Pharmacopoeia of the United States, Eleventh Decennial Revision," bearing the Roman numeral XI., which appears to be an official copy, No. 137111, entered, according to Act of Congress, in the year 1935 by the Board of Trustees of the United States Pharmacopoeial Convention in the office of the Librarian of Congress at Washington. Is this volume the one that is commonly referred to as the U. S. Pharmacopoeia?

A. It is.

Q. Will you refer us to the page upon which you find the standards relating to paraffin wax which describe the wax which you have just told us of?

A. Page 276.

Q. Subject to the right of the defendants to de-

2323 mand the production of an original volume, this volume being property of the Socony Vacuum Corporation, which the plaintiff agrees to produce if required, I will ask you to read into the record the standard contained in that volume for the paraffin wax which it is your testimony this product you have described complies with?

A. (reading.)

"A purified mixture of solid hydrocarbons obtained from petroleum.

"Description and Physical Properties—A colorless or white more or less translucent mass, frequently showing a crystalline structure. It is without odor or taste and is slightly greasy to the touch. Paraffin is insoluble in water and in alcohol; slightly soluble in dehydrated alcohol; frequently soluble in chloroform, in ether, in benzine, in petroleum benzin, in carbon disulphide, in volatile oils and in most warm fixed oils.

"Tests for Identity and Purity—Specific gravity, about 0.900 at 25 degrees Centigrade. It melts between 50 degrees and 57 degrees Centigrade (page 455). When strongly heated, paraffin ignites, burns with a luminous flame and deposits carbon.

2324 "Heat about 0.5 grams of paraffin in a dry test tube with an equal weight of sulphur: the mixture evolves hydrogen sulphide and becomes black due to the liberation of carbon. Shake melted paraffin with an equal volume of hot alcohol: the separated alcohol does not redden moistened blue litmus paper (acids). Pour 5 c.c. of paraffin at a temperature just above its melting point, and 5 c.c. of sulphuric acid into a glass stoppered cylinder which has previously been rinsed with sulphuric acid and heat in a water bath at 60 degrees Centigrade for ten minutes, shaking the mixture at intervals of one minute: the paraffin remains unchanged in color and the acid does not become darker than pale amber (carbonizable substances)."

Q. The quotation that you have read refers to the melting point as being from 50 to 57 degrees Centigrade. Can you translate that for us into Fahrenheit?

A. Approximately 122 to 135 degrees Fahrenheit.

Q. The quotation that you have read refers to the deposit of carbon and the burning of the paraffin in case it is strongly heated.

A. With sulphur present.

Q. With sulphur present. Heating this paraffin
2325 wax to a high temperature, that causes it to disintegrate, does it?

A. Yes.

Q. And at about what point Fahrenheit does it commence to change its form?

A. The temperature at which incipient thermal decomposition takes place is approximately 650 degrees Fahrenheit.

Q. And what occurs at that point?

A. If no air is present, or oxygen, the wax thermally decomposes, forming hydrocarbons of lower molecular weight, less saturated and perhaps some free carbon.

Q. If oxygen is present, what occurs?

A. If oxygen is present and the material is ignited at that temperature the hydrocarbon will be completely converted to carbon dioxide and water.

Q. The paraffin wax that you have described I under-

stood you to say complies with the definition of paraffin wax as given in U. S. Pharmacopoeia XI.; is that right?

A. It does.

Q. Are you also familiar with the standards of U. S. Pharmacopoeia X., which preceded this?

A. I am.

Q. Would your testimony with respect to that be the same?

2326 A. It would be.

Mr. Rall: Now, I will ask that the Notary mark this carton as "Plaintiff's Exhibit 1" for identification.

(The carton referred to was marked for identification "Plaintiff's Exhibit 1, April 25, 1939.")

(Then there followed some discussion off the record.)

Q. I show you Plaintiff's Exhibit 1, identified by the Notary, and ask you to state what occurs when a carton of that type is immersed in the paraffin wax that you have described, heated to a point between 170 and 185 or 190 degrees Fahrenheit and then removed and cooled?

A. Depending upon the time of immersion, there is a certain amount of penetration of the wax into the board, and even in a brief time sufficient penetration to give good adhesion of the surface film, which is a continuous film, which is subsequently left upon the carton after removal from the wax bath during the draining period.

Q. When you refer to adhesion, you mean the adhesion of the paraffin wax to the fiber board; is that correct?

A. I do.

2327 Q. Is there any chemical reaction connected with this process that you have referred to?

A. There is not.

Q. Is the wax after the immersion and subsequent cooling of the same chemical composition that you described in your testimony, referring to the paraffin wax manufactured by your company?

A. It is.

Q. With respect now to the properties of a fiber board such as Plaintiff's Exhibit 1, before and after the immersion in paraffin, with respect to liquids, the effect of liquids such as water or milk on the exhibit, what, if any, change does this paraffining process bring about?

Mr. Schaefer: What is the question?

(Question read by the reporter.)

Mr. Rall: Is my question clear to you?

The Witness: I think so, yes.

A. The impregnating and coating operation produces a continuous film which prevents any contact between any aqueous phase liquid placed in that container and the original paper fibers.

Q. In other words, the paraffin coating makes the paper fiber impervious to a liquid such as water or milk; 2328 is that correct?

A. It does at temperatures below the melting point of the wax.

Q. As I understand your testimony, below the melting point of wax it is impervious to water or what you have described as an aqueous phase liquid?

A. Yes.

Q. And is milk included in that definition?

A. Yes.

Q. Have you given any study to the question of the coating of fibers and papers with this paraffin wax manufactured by your company?

A. Yes; a very considerable amount of technical work has been directed to this problem in our laboratories.

Mr. Schaefer: I object to that because it is not responsive.

Q. Have you yourself made studies in that connection?

A. I have, personally, and additional studies have been made under my direction.

Q. Is this process that you have described of coating with paraffin a fiber carton such as Plaintiff's Exhibit 1 substantially the same process that is used in what we call wax paper or paper cups or things of that type?

2329 Mr. Schaefer: I object to that as immaterial.

Mr. Rall: You may answer subject to the objection.

A. It is.

Q. For what purposes is the paraffin wax manufactured by your company, which you have described, used?

Mr. Schaefer: That is also objected to as immaterial.

Mr. Rall: You may answer subject to the objection.

A. It is very largely used in the paper industry as an impregnating and coating material. It is also used as a household sealing-wax for fruit and jelly jars. It is used as an ingredient of wax polishes and finishes. It is used as an ingredient in the sizing of paper. It is used as an

electrical insulating material, and for many other purposes.

Q. Does your company sell wax for the purpose of sealing fruit jars?

Mr. Schaefer: That is objected to as immaterial.

A. We do.

Q. And does that have a trade name?

A. Yes, in various territories it is known as either Parowax or as Paraseal wax.

Q. In what size cakes are those sold?

Mr. Schaefer: Do you want me to object every time?

Mr. Rall: No; your objection to the materiality of this testimony stands.

The Witness: Will you repeat that question?

(Question repeated by the reporter.)

A. In quarter-pound cakes, packed four to the one-pound box.

Q. And the box is substantially the size of a pound of butter, is it not?

A. It is.

Q. And the wax so used is melted by the housewife and poured on the top of fruit for the purpose of sealing it in the preserving process; is that true?

A. That is correct.

Q. Is this product you referred to as Parowax, sold for the purpose mentioned, the same or a different product than the paraffin wax that you shipped to Chemung, Illinois?

A. It happens to be identically the same material as that which has been shipped to Chemung, Illinois, for the account of the Dean Milk Company.

Q. The difference being, I take it, in the form of the size of the cake and the method of packaging the article?

A. That is correct.

Q. You referred to the use of this paraffin wax in
2331 the impregnating and coating of papers by the paper industry. What is the purpose of that?

A. Probably the most important purpose is to render the material being coated or impregnated moisture proof.

Q. And is the reason that that material, when so impregnated or coated, is moisture proof the same reason that you have given for your statement that when Plaintiff's Exhibit 1 is immersed in wax it becomes impervious to an aqueous phase liquid?

A. Yes.

Q. Will you give us so far as you can think of offhand examples wherein paraffin wax is used for that purpose in other products or packages containing liquids or intended for liquids other than a container for milk?

Mr. Schaefer: That is also objected to.

Mr. Rall: Your objection stands as to the materiality until I tell you that I am changing my line of questions.

Mr. Schaefer: Fine.

A. Containers intended for the packaging of such materials as ice cream and cheese; containers intended to hold for a brief period of time coffee, water, tea or other beverages and so forth, represent good examples.

2332 Q. Would the tiny sealed cup containers that the air lines use for the cream, dispensing of cream to their passengers, be an example of what you have referred to, or are you acquainted with that?

A. At least some of them would be. I know of some which are paraffin wax coated.

Q. Are the paper cups that are used for individual drinking cups largely within the class of products that you would refer to?

A. They are.

Q. Do you know the names of any that are impregnated with the wax manufactured by you?

A. You mean the trade names?

Q. Yes.

A. No, I do not. I cannot answer that question

Q. Is there any difference between the penetrating powers of milk and cream into a paraffin coated fiber board and the penetrating powers of water?

Mr. Schaefer: I object to that for the additional reason that the witness has not been qualified to express an opinion on that subject.

A. Technically there is some difference.

Q. And what is that difference, if you know?

2333 A. Milk contains a certain amount of butter fat in suspension in the water, which butter fat has a greater dissolving effect upon the wax coating than ordinary water, and therefore a container coated with wax will hold water generally for a longer period of time without failure than will a similar container filled with milk or cream.

Q. Does the depth or thickness of the coating of the paraffin on the container have a relationship to the time that

the container remains impervious to penetration by milk or cream?

A. Yes.

Q. And the thicker the coating, the more impervious it will become, or the longer will be the time that it will retain its imperviousness to penetration?

A. Other things being equal, that is correct.

Q. Have you or has anyone under your direction—I think it is fair to say now that I am changing my line—have you or has anyone under your direction made any tests with respect either to the desirable thickness of the coating of paraffin on milk containers or as to the time, depending upon the thickness, that the container remains impervious to the absorption of milk?

A. Yes.

2334 Q. Have those studies been based upon the thickness of the paraffin by measurement or upon the immersion time in the paraffin bath of the carton?

A. There has been no actual measurement of the thickness of the film, but the thickness of the film has been approximated by observations connected with the details of the method of application of the film and the amount of wax applied to a unit area of board, the higher the temperature and the longer the period of immersion giving greater penetration and lesser surface film, and the shorter the time of immersion and the lower the temperature of impregnation, followed in some cases by chilling, giving increasingly thicker films, thicker continuous films of wax upon the surface.

Q. What is the effect on bacteria that might be present either on the surface of the fiber board, such as Plaintiff's Exhibit 1, or in the paraffin of the heating process and the immersing of Plaintiff's Exhibit 1 in the paraffin bath?

Mr. Schaefer: That is objected to on the ground that the witness has not been qualified to answer that question.

A. Although I am not a bacterialogist, I understand from reputable sources that paraffin is an active sterilizing material, particularly at the temperatures of applica-

2335 tion referred to.

I agree with Mr. Schaefer that I am not in a position to answer that question. You should get a bacterialogist to answer it.

Mr. Rall: I think you may cross-examine subject to one question that I will ask on further direct.

Cross-Examination by Mr. Schaefer.

Q. When you were referring to the impregnation of paper and the thickness of the resulting coating from immersion in paraffin, what temperature ranges and what time intervals did you have in mind?

A. We work in temperature ranges from 140 to 220, perhaps 240 in one or two isolated cases, degrees Fahrenheit for times of immersion varying from a second up to a minute or longer, with various cooling methods used after immersion, such as cooling at room temperature, cooling under forced air draft, and cooling by passing through cold water.

Q. And those were the temperature ranges and those were the time intervals that you had in mind in your direct examination?

A. Yes. That time referred only to time of immersion.

Q. Yes. Now, you have testified as to the melting point of paraffin and as to the decomposition point. What
2336 happens to paraffin when heat is applied to it between those two points?

A. Practically nothing so long as there is no contact with oxygen or other active chemical substance.

Q. At what temperature will oxidation of paraffin begin?

A. Oxidation of paraffin will begin at relatively low temperatures. It is only really significant at temperatures—

Q. No; just answer the question that I asked, Mr. Keyser.

A. At relatively low temperatures. Well, I can only answer it by saying that no oxidation, no appreciable oxidation will occur below the melting point of wax. The wax in the molten state in contact with air will oxidize to a greater or lesser extent, depending upon the temperature and the area exposed to the oxygen.

Q. And will it depend also upon the length of time that heat is applied?

A. Yes; it depends upon the time factor plus the factor of the area exposed to the air.

Q. Plus heat?

A. Plus heat, plus temperature. There are three variables there.

2337 Q. What is the nature of the products of the oxidation of paraffin?

A. The paraffin, when it oxidizes, eventually forms the usual organic oxy materials, such as acids, esters, ketones and the usual insoluble petroleum sludges.

Q. How acid are those products of oxidation, Mr. Keyser?

A. They are typical weak organic acids.

Q. Can you give us their strength?

A. In terms of what?

Q. In terms of usual acid measurements.

A. The usual acid measurement is the effect upon the PH of water.

Q. Water is neutral?

A. Pure water is neutral. They are relatively insoluble and have a very slight depressing effect upon the PH of an aqueous solution, but they are regarded as very weak organic acids.

Q. What would you say their PH measurement is?

A. That would depend upon their concentration and their nature.

Q. That would depend upon the length of time exposed to heat?

2338 A. To a certain extent, yes, and the concentration in the water and the concentration in the wax. That is, you have got to bring the wax in contact with the water, and then a certain amount of those materials would have to be leached out into the water.

Q. And would you say that those products of oxidation have an acid measurement of PH5?

A. They might have, yes.

Q. You referred to the temperature maintained during the manufacture of the paraffin. Did I understand you to say that 160 degrees is uniformly maintained?

A. No; that was the temperature at which the wax was molded, poured into the molds.

Q. And that is uniformly maintained?

A. That is uniformly maintained.

Q. Is paraffin itself a bactericidal agent?

A. Again, I would refer to the fact that I am not a bacteriologist, but it is my understanding that it is.

Q. And, referring to the waterproofing action of paraffin when applied to paper, does the paraffin uniformly impregnate the paper?

A. Reasonably, yes.

Q. You mean it does not uniformly impregnate the paper?

2339 A. I mean reasonably so it does impregnate the paper.

Q. But there is no absolute uniformity of impregnation?

A. Nothing in this world is absolutely uniform.

Q. Including the impregnation of paper by paraffin?

A. Pardon?

Q. Including the impregnation of paper by paraffin?

A. That goes without saying.

Q. Does the paraffin coat each fiber of the paper?

A. Each fiber of the paper with which it comes in contact. Of course, it may not penetrate to the center of the board, but if it comes in contact with the fiber it quite uniformly coats it.

Q. You enumerated all of the practices of personal cleanliness and the sanitary practices that are engaged in by the men who handle the molten wax when packing it?

A. I referred to those practices, yes.

Q. And you referred to all of them?

A. I referred only to the specific practice that they wash their hands thoroughly with soap and water.

Q. And that is the specific practice that is engaged in by the men?

A. That is the specific practice.

Q. Are there any other practices engaged in?

2340 A. No. And I think it is significant to note here—

Q. The answer is "No," Mr. Keyser.

A. Well, I want to modify that "No."

Q. All right.

A. No, because paraffin itself is regarded as quite a sterile material, and a plant or building wherein only paraffin wax is handled is a place where the maintenance of a reasonable, commercial sterile condition is rather a simple process.

Mr. Schaefer: If that is on the record, I want to object to the last portion of the last answer, everything beyond "No," as unresponsive to the question.

Q. Who manufactures the treated craft paper which is used in the burlap bags?

A. I don't recall offhand. I have known, but I have forgotten.

Q. And those bags, how do they leave your plant?

A. How do they leave our plant?

Q. Yes.

A. With the wax in them?

Q. Yes.
A. They are—
Q. I mean by truck, by rail? What happens?
2341 A. They are either packed in carloads, or they may leave by truck or whatever the method of delivery to the customer by our warehouse is.
Mr. Schaefer: That is all.

Redirect Examination by Mr. Rall.

Q. How are these men dressed who handle paraffin wax?
A. In work clothes which are used in the premises only.
Q. They change their clothes when they come in?
A. They do.
Q. And when they are not at the plant where are those clothes kept?
A. In lockers provided for the purpose.
Q. Do they wear aprons?
A. They do not.
Q. As part of your direct examination this is what I wanted to ask. It will be subject to cross-examination. Assuming that a fiber carton such as Plaintiff's Exhibit 1 is immersed in a paraffin bath heated to a temperature ranging from 165 to 185 degrees, with the bottom sealed five seconds down and five seconds up, and then is cooled for one minute at a temperature of approximately 40 degrees by artificial cooling—
Mr. Schaefer: Forty degrees what?
2342 Mr. Rall: Fahrenheit.
Q. (Continuing.) —do your studies give you an opinoin as to what length of time a carton so treated with your paraffin wax will be impervious to the absorption of milk or cream?
Mr. Schaefer: That is objected to. The witness has not stated that he has made any studies directed toward that thing.
Mr. Rall: Yes; he says he has.
A. Yes.
Q. Of what did the studies consist which give you an opinion on that subject?
A. Studies with containers so coated, both in the laboratory and in commercial operation, and the usual standard tests with a number of containers containing the liquid or

by experiments at regular periods of time to develop the time of failure.

Q. And by "failure" what do you mean?

A. Softening of the board, indicating that moisture has broken through the wax coating, penetrated the board, or actual leaking.

Q. Are these some of the tests that you previously described you made on the general subject of the coat-
2343 ing of papers?

A. They are.

Q. Will you state your opinion as to the length of time, after a carton has been treated as I described in my previous question, that the carton so coated would be impervious to penetration through the paraffin of cream or milk?

A. Under the conditions that you have described, and from the work which we have done, I would expect that such containers would be satisfactory for a period of from one to two weeks.

Mr. Schaefer: That is objected to as not responsive.

Q. Now, when you say "satisfactory," you mean that it would not develop impregnation through the paraffin of the fiber board; is that correct?

A. That is correct.

Q. I mean absorption of milk or cream into the fiber board.

A. That is correct.

Q. And when you say you would expect—

A. (Interposing.) I mean that is what our tests have indicated.

Q. And that is your opinion?

2344 A. That is right.

Mr. Rall: You may cross-examine.

Recross Examination by Mr. Schaefer.

Q. How did you determine when there was penetration in those tests?

A. As I said, in the case where we work with the container itself, the indication is when a soft spot or bulge appears and you can immediately detect penetration by water into the fiber by a certain amount of discoloration and softening of the board. Also, in some cases you also get leakers. Both phenomena are observed.

Q. And that is the type of penetration that you are talking about?

A. That is right.

Q. And the only type of penetration that you are talking about?

A. No. On the other hand, studies have been made with board—

Q. Your tests, now, Mr. Keyser.

A. Our tests have also included studies with board waxed, not made up into containers, but immersed in the liquid in question, and samples removed at regular intervals, the surface moisture being removed and the specimen weighed to determine whether or not there has
2345 been any penetration of moisture into the board through the wax film which would result in an increase in weight.

Q. And you have found a period of two weeks—

A. Under the conditions described, with this type of board, and with that type of waxing, I would expect that there would be no material increase in weight for a period of one week, and, in some cases, possibly two weeks. I gave that as a range.

Q. Now, are the results of those experiments uniform?

A. Quite reasonably uniform, provided the application of the wax is uniform. That is the most critical point in the actual, technical work—to obtain a uniform application of the wax.

Q. Well, would you call a variation of one week to two weeks reasonably uniform?

A. I have given that average because it is impossible, on the basis of the brief description on the method of the application of the wax, to exactly correlate it with laboratory experiments.

Q. Do your laboratory experiments indicate a variation?

A. There is very little variation, provided the wax is uniformly applied. That is, you take two pieces of board to which wax has been applied, the same wax in
2346 exactly the same fashion. The results will check each other very satisfactorily; I should say, on the average, within five to ten per cent.

Q. Suppose you took containers?

A. Pardon?

Q. Suppose you took containers?

A. There, too, the results have been quite satisfactory from the point of view of uniformity.

Q. Has there been as much uniformity in the case of containers as in the case of boards?

A. In the case of a container there are so many more possibilities of slight deviations that the uniformity will not be as great as with a single piece of board immersed in the liquid.

Mr. Schaefer: That is all.

Mr. Rall: That is all.

Plaintiff's Exhibit 1 referred to in the testimony above is attached hereto.

Paul V. Keyser, Jr.

Subscribed and sworn to before me this 5th day of May, 1939.

Irvin Taber,
Notary Public,
Bronx County No. 39,
N. Y. County Clerk's No. 323.

(Seal)

Commission expires March 30, 1941.

CERTIFICATE.

State of New York, }
County of New York. } ss.

I, Irvin Taber, a Notary Public, duly commissioned and acting in and for the County of New York, State of New York, do hereby certify that the foregoing deposition is a true record of the testimony given by the witness Paul V. Keyser, Jr., upon his oral examination before me, pursuant to notice dated April 15, 1939, at the office of Mudge, Stern, Williams & Tucker, 20 Pine Street, New York, N. Y., on Tuesday, April 25, 1939, commencing at 2:00 o'clock, p. m.; that the said witness was duly sworn by me before testifying and that his testimony was
2348 personally recorded by me stenographically and transcribed under my direction, and that when the aforesaid testimony was fully transcribed the deposition was

submitted to the witness for examination and was read and signed by him in my presence, at which time he was again sworn by me.

I further certify that there appeared at the taking of said deposition Gariepy & Gariepy, Esqs., attorneys for plaintiff, by Owen Rall, Esq., of counsel; and Barnet Hodes, Esq., corporation counsel of the City of Chicago, by Walter V. Schaefer, Esq., and Charles P. Hogan, Esq., assistants corporation counsel.

I further certify that I am not of counsel nor related to any of the parties in this action, nor am I interested in the outcome of this suit.

In testimony whereof, I have hereunto set my hand and seal this 5th day of May, 1939.

I. M. Taber,
Notary Public,
Bronx County No. 39,
N. Y. County Clerk's No. 323.

(Seal)

Commission expires March 30, 1941.

23481/2 No. 96533.

State of New York, }
County of New York. } ss.

I, Archibald R. Watson, Clerk of the County of New York, and also Clerk of the Supreme Court in and for said county, do hereby certify that said Court is a Court of Record, having by law a seal; that Irvin Taber, whose name is subscribed to the annexed certificate or proof of acknowledgement of the annexed instrument was at the time of taking the same a notary public acting in and for said county, duly commissioned and sworn, and qualified to act as such; that he has filed in the Clerk's Office of the County of New York a certified copy of his appointment and qualification as Notary Public for the County of Bronx with his autograph signature; that as such Notary Public, he was duly authorized by the laws of the State of New York to protest notes, to take and certify depositions; to administer oaths and affirmations; to take affidavits and certify the acknowledgement and proof of deeds and other written instruments for lands, tenements and hereditaments, to be read in evidence or recorded in

this state; and further, that I am well acquainted with the handwriting of such Notary Public and verily believe that his signature to such proof or acknowledgement is genuine.

In testimony whereof, I have hereunto set my hand and affixed the seal of said Court at the City of New York, in the County of New York, this 22nd day of May, 1939.

Archibald Roberts,
(Seal) *Clerk.*

2349 Plaintiff's Exhibit 1 is forwarded as a Physical Exhibit.

2353 IN THE DISTRICT COURT OF THE UNITED STATES.

* * (Caption—316) * *

(Filed May 24, 1939. Hoyt King, Clerk.)

Depositions of witnesses taken in behalf of the Plaintiff pursuant to notice served on the Defendants on April 15, 1939, at the offices of Dechert, Smith and Clark, Esqs., 1320 Packard Building, Philadelphia, Pa., on Thursday, April 27, 1939, at 10 o'clock a. m., before Lewis A. Bicking, a Notary Public in and for the Commonwealth of Pennsylvania.

Present:

Gariepy and Gariepy, Esqs., by Owen Rall, Esq., representing the Plaintiff.

Barnet Hodes, Esq., corporation counsel of the City of Chicago, by Walter V. Schaefer, Esq., and Charles P. Horan, Esq., assistants, corporation counsel.

2354 HERBERT M. PACKER, having been duly sworn, was examined and testified as follows:

Direct Examination.

Mr. Rall: To save time, the plaintiff agrees that all objection to the materiality of any testimony during this deposition may be made when the deposition is offered in evidence without the necessity of counsel at this time interposing such objection.

Mr. Schaefer: All right.

By Mr. Rall:

Q. Mr. Packer, will you state your name?

A. Herbert M. Packer.

Q. And where do you reside?

A. 1717 North 41st Street, Philadelphia.

Q. How old are you?

A. 48 and a half.

Q. What is your business or profession?

A. Civil engineer by profession. My position is chief of the division of housing and sanitation in the Department of Public Health, City of Philadelphia.

Q. How long have you been in that position?

A. I have been Chief since April, 1925.

Q. You attended high school?

2355 A. Yes, sir. I attended the Philadelphia Grammar Schools, the Central Manual Training High School in Philadelphia, graduating in 1908. At the University of Pennsylvania I took the course rating the degree of Bachelor of Science in Civil Engineering, and graduated in June, 1912.

Q. At the University did you specialize in any particular branch?

A. I specialized in sewage disposal and public health work.

Q. After you were graduated, what did you then do?

A. I went to work for the City of Philadelphia as a laborer.

Q. Was that your classification?

A. That was my classification and my work.

Q. What was the nature of that work?

A. I worked in what was known as the bridge and sewer division, sewer maintenance work and bridge maintenance work, putting down bridge flooring, and cleaning sewers, repairing sewers on the inside.

Q. From that time until the War, will you describe just briefly what positions you held with the City?

A. I went through the grades of Assistant Foreman, Foreman, Inspector, Engineering Inspector, Assistant
2356 Engineer of Sewers, then assistant engineer in land drainage work, which position I held when the War broke out in 1917; then mosquito elimination work and land drainage work in the southern sections of our city.

Q. During the war time what did you do?

A. I was commissioned a first lieutenant in the Sanitary Corps, and then promoted to Captain; went into the

service in September, 1917, and was promoted in March, 1918, went overseas in May of 1918.

Q. While you were in the Army at what points were you stationed?

A. I started at Millington, Tennessee, in an aviation camp. Then I went over to Camp Sevier at Greenville, South Carolina, and then Camp Sherman, at Chillicothe, Ohio, and then overseas.

Q. What was the nature of your work?

A. I was attached to the Medical Service doing sanitary work pretty well all over France, although quite a lot of the time I was at a hospital called Mesves Bolcy in the interior of France, a sixty thousand bed hospital, as sanitary officer for the area. It covered several square miles.

Q. When did your connection with the Army terminate?

A. I was discharged in June, 1919, and went back
2357 to work for the City in the Bureau of Health as a supervisor of sanitation in charge of investigation of all types of nuisances in the city.

Q. And how long did that work continue?

A. I kept in that job until I was appointed Chief in April, 1925.

Q. When you were appointed in 1925 as Chief of the Division, state briefly what your duties were.

A. That took in many different classifications of work, nuisance work, housing or multiple dwelling work, and plumbing work. In the middle of 1927 there was a consolidation of divisions, and the division of milk inspection and the division of meat inspection was made part of the division of housing and sanitation, and I took charge of that work.

Q. How long were you in charge of milk inspection work?

A. Until 1936, at which time meat and milk were consolidated into a division of its own.

Q. Who is now the head of that division?

A. Dr. Yunker, Elkan Yunker. He is now Chief Vetinarian.

Q. When you became milk inspector—I am just using that regardless of what your title was—what, if anything, did you do by way of study, or travelling, and so
2358 forth, to acquaint yourself with the duties of your office?

A. My experience in milk at that time had been largely

theoretical. I had no practical experience, and I had to gain a lot of it since I was going to have charge of the milk inspection in Philadelphia, I had to get a lot of it in a hurry. I spent the next year doing nothing but studying milk, going around to all our plants, practically living in them, living in our farms finding out what I could find out about milk inspection, and supply, and equipment.

Q. You also read literature on the subject?

A. Oh, yes, I think I read everything it was possible to get.

Q. About what is the approximate population of the City of Philadelphia?

A. It is approximately two million.

Q. What is the method of delivering milk? There is house to house delivery?

A. We have two main methods, house to house delivery; that is, for household milk, house to house delivery; and store.

Q. Chain store?

A. Chain stores and independent stores.

Q. Where does the milk come from, largely?

2359 A. Well, from Pennsylvania, New Jersey, Delaware; I should say about eighty per cent of it comes from Pennsylvania, or Pennsylvania farms.

Q. At about what distance marks the limit of what you might call your milk shed?

A. 200 or 250 miles.

Q. Shipped in by train?

A. Truck, mostly.

Q. In connection with your work did you attend any meeting of public health officials, dairy shows, or anything of that kind?

A. Yes, I attended practically every dairy show, every conference that I knew of, innumerable conferences.

Q. With whom were these conferences?

A. Well, the health officials of this district have a group that meet together every month, and they discuss all sorts of topics. Milk officials have another group. There are a number of groups of officials having to do with various plans of public health work. We meet at various times. I try to attend as many of those as possible.

Q. Did you attend a conference at Geneva, New York, in July, 1937?

A. Yes, sir, I did.

2360 Q. What was that conference?

A. That was a conference called by Dr. Breed and Dr. Sanborn, of the New York Agricultural Experiment Station to discuss paper containers for milk. At that conference were public health officials, paper bottle manufacturers, paper manufacturers, and quite a few research men who had done considerable work in the field of paper bottle research.

Mr. Rall: Will you identify that with your signature?

(A leaflet entitled, "The Milk Sanitarian," marked Plaintiff's Exhibit 4, was signed by the Notary.)

By Mr. Rall:

Q. I show you what we have marked Plaintiff's Exhibit 4; a printed leaflet inserted in that exhibit is entitled, "Conference on Sanitation, paper milk containers, New York Experiment Station, Geneva, New York, July 12, 1937." Is that the report of the conference you just referred to?

A. That is correct. That is a report of the conference.

Q. For the record, being a reprint from "The Milk Sanitarian", Volume 6, number 9, September, 1937, pages 11-13, 703 Anacapa Street, Santa Barbara, California.

What, if any, study have you made, or investigation
2361 of the subject of the use of paper containers for the sale of liquid milk?

A. I have been pretty much interested in the use of single service containers for milk ever since I have been identified with milk inspection work, and since Philadelphia is possibly one of the pioneer cities of paper bottles and had for a long time one of the few successful installations of paper bottles in our city, I had an opportunity to see just how it worked out with not only the containers but with the public reaction, and public health.

Q. When were paper bottles first used in the City of Philadelphia, if you know?

A. I think they came in here shortly after I took charge of the milk section, I think about 1928 our first bottles came in here, '28 or '29, I am not quite certain of that date.

Q. In that connection, did you make some examination of the entire subject before permitting the sale of milk in those containers?

A. Yes, the first containers that came in here were the Sealrite from Fulton, New York, and the Sealcone from New York. The first bottle was one just made in the plant

at Fulton, New York, and shipped down in cartons,
2362 and the other were blanks that were shipped into the plant, and the bottle was made right in the plant. I had an opportunity to make a number of studies of those and had our laboratory make a number of bacteriological studies on them. Both bottles have been continuously used in Philadelphia since that time.

Q. Did you make any investigation of the sanitary conditions under which the paper going into those bottles was manufactured?

A. I have not been to a mill. I can't tell you anything about the sanitation of mills other than a report of conditions of mills prior to the Breed conference at Geneva, and I feel that they were at that time in pretty bad shape, that there was very little attention paid to the quality of water used; in a good many instances, to the quality of stock used; that they had not identified cardboard with any such food as milk, and the need for sanitation apparently was not evident to them up until that time. I think that opened their eyes. I think since that time the reports we have gotten from various companies—

Mr. Schaefer: Just a minute. I want to object to any statement as to reports that you have gotten as to conditions in the mills.

2363 By Mr. Rall:

Q. You may continue, subject to the objection.

A. The reports that we have gotten led us to believe that the mills have cleaned up, that the water supplies are now in conformance with the United States Public Health standards, and that the stock that is used is all virgin stock. There is no second-hand stock used. We have not, incidentally, made any inspection of mills.

(A cardboard milk container marked Plaintiff's Exhibit Number 2 was signed by the Notary.)

By Mr. Rall:

Q. I show you Plaintiff's Exhibit 2, purporting to be a quart Pure-Pak milk bottle. Have containers of that type been in use in the City of Philadelphia?

A. Yes, they have been in use in Philadelphia for five or six years.

Q. What dairy uses those?

A. Well, the main dairy using them now is the Silver Seal, or Sylvan Seal Company at 612 South 24th Street. They have just taken this type of container on in the last

few months, switching over from the Sealcone. Prior to that time they were used by a dairy up at Bordentown, or Wrightstown, I forget which, just across the line in New Jersey. They brought in a small quantity of them, 2364 not many of them.

Q. Were you in charge of milk inspection at the time the use of this particular container started?

A. That's right.

Q. At that time was it submitted to you for approval?

A. No. I went to Toledo to investigate this bottle, and to investigate the machinery that made it, and was very much impressed with the bottle and with the way it was made—

Mr. Schaefer: I object to that.

By Mr. Rall:

Q. You may answer, subject to the objection.

A. I went into it very thoroughly at that time as to how it was made, and cooling, paraffin, the type of paraffin used, brought back a number of samples, and had our laboratory analyze them.

Q. What sort of a test did they make?

A. They made bacterial counts on the inside of the containers. I am depending entirely on my memory of five or six years on that, I am not quite certain, but I think they wash tested on the inside of the bottles.

Q. Are you certain you did submit samples to the laboratory and that their report was favorable?

A. Positively, yes. I am quite certain it was 2365 favorable.

Q. From a public health standpoint, and from your experience in milk control work, can you make a comparison between the use of the glass milk bottles and paper single service containers as to what you consider the advantages of one over the other, or vice versa?

Mr. Schaefer: That is objected to upon the ground of immateriality, and upon the additional ground that such a comparison doesn't afford any competent evidence to determine the question at issue in this case.

By Mr. Rall:

Q. You may answer, subject to that objection.

A. I personally like single service containers. I feel that glass milk bottles—that our dairies are doing all that they possibly can to turn out sterile containers, but my experience is that glass milk bottles are the most abused articles in the world.

The dairies, themselves, and our Public Health Departments, for that matter, tried to prevent the abuses, consequently depending too much on the sterilization of the bottle when it gets back to the milk plant, regardless of whether it is picked up from a dump, or comes from
2366 a doctor's office. We don't have enough factor of safety in that washing and sterilization, so that I much prefer a single service container. I personally believe that the day of the glass milk bottle and the container that is reused in milk is going to be a thing of the past.

Q. You referred to abuses of glass milk bottles. Will you describe briefly what you mean by that?

Mr. Schaefer: I would like to have the same objection continue to all questions involving a comparison between the paper and glass, and also all questions dealing with the condition of glass.

Mr. Rall: That is satisfactory. Without renewing the objection, it stands to this line. Will you read the question?

(The question was repeated by the Reporter as follows:)

"Q. You referred to abuses of glass milk bottles. Will you describe briefly what you mean by that?")

A. Well, a glass built milk bottle is the handiest thing in the world for anything that you want it for. If you want to buy turpentine, coaloil, or if you want a sample for a doctor's office, a urine sample, a glass milk bottle generally is the receptacle that is used. So many of them are picked up from dumps and returned to the
2367 dairies. The dairies, themselves, leave them on the streets where they are a target for every passing dog. That doesn't happen to single service containers.

By Mr. Rall:

Q. You referred to a factor of safety in connection with the sterilization of glass milk bottles. What is the common practice with respect to the method of sterilizing glass milk bottles?

A. Well, depending on the sterilizing agent that you use. You put in enough to sterilize the bottle, but they don't have much of a factor of safety. The factor of safety as a rule is one, and if the job is done perfectly, of course, you have a sterile bottle, but if there is any slip at all, you don't have a sterile bottle, and that is very frequently the case, that with glass milk bottles you don't have a sterile container.

Q. Has your experience indicated whether or not the bacteria counts on glass milk bottles are subject to rather violent variances?

A. Yes, on all bottles, paper included.

Q. That is true with respect to them?

A. Yes.

Q. This Plaintiff's Exhibit 2 appears to be coated with a substance. Can you tell what that is?

2368 A. Well, in Philadelphia they use 100% mineral, paraffin, and I imagine that is what is on here. It seems to be.

Q. What is your opinion of paraffin as a sealing agent?

Mr. Schaefer: I object to that on the ground the witness has not been qualified to express his opinion.

By Mr. Rall:

Q. You may answer, subject to the objection.

A. I think it is a very good sealing agent. I dare say that in the ten years that I was in charge of milk, there were one hundred and fifty million quarts of milk sold in paper bottles, and we never had a record of any illness having been caused by any one—

Mr. Schaefer: That is objected to as not responsive.

Mr. Rall: I am the only one who can object on that ground, Mr. Schaefer.

By Mr. Rall:

Q. Continue.

A. I think the question had to do with paraffin.

Q. That is true, your opinion of paraffin as a sealing agent.

A. I think it is very good. My memory goes back to when I was a kid, we used to chew paraffin. It was a

2369 very common ingredient of candy at that time. We used to take paraffin, and put sugar in it, and sell it as a sort of a substitute for chewing gum, and I still think it is a very good sealer for milk containers.

Q. During the time that you have referred to when you estimate that one hundred and fifty million quarts of milk were sold in paper containers, did you have any complaints or any personal knowledge yourself of paraffined paper bottles absorbing the milk or cream?

Mr. Schaefer: That is objected to on the ground that it is incompetent evidence.

By Mr. Rall:

Q. You may answer, subject to the objection.

A. I never heard any real criticism raised of milk absorbing into the paper through the paraffin. I can see where if it stayed in the bottle for any prolonged period it might absorb into the paper, but you don't keep it in there that long.

Q. When you say a prolonged period, what time did you have in mind?

A. Well, in a couple of weeks or a month it might soften up, and the milk or cream might be absorbed into the paper.

Q. State whether or not during the time that the
2370 paper milk containers have been in use in the City of Philadephia there has been any infection, disease or epidemic which you as Public Health Official in charge of milk inspection believed or even suspected was due to the use of paper milk containers.

Mr. Schaefer: That is objected to upon the ground of incompetency.

A. None whatever.

By Mr. Rall:

Q. In connection with the glass milk bottle is paper used?

A. Yes, for the cap, for the plug paper is used, or cardboard is used.

Q. That is essentially no different in type—that is, so far as its being paper fibre is concerned—than the material in Plaintiff's Exhibit 2, is it?

A. That is true.

Q. You are acquainted with some of the uses to which paraffin covered paper or paraffin covered fibre board are put? Can you state some of the uses?

A. Well, it is used for covering these plugs, these paper plugs that are used in glass bottles.

Q. I am referring, now, also to any other common uses that you may know of.

2371 A. Yes, it is used for any number of food containers and food dispensers, paper cups, butter cartons, and all sorts of cartons for carrying foods out of stores, soups, a number of dry cereals, coffees; hundreds of food products are put into paraffin paper.

Q. Also ice cream and cheese?

A. Ice cream and cheese.

Q. Are those uses that you have referred to generally accepted by Public Health Officials throughout the country, if you know, as being sanitary?

A. Oh, yes.

Mr. Schaefer: That is objected to.

The Witness: I will say in so far as I have traveled, I have seen them in every city I have ever been in.

By Mr. Rall:

Q. Are you acquainted with the extent to which containers such as Plaintiff's Exhibit 2 are used in this vicinity outside of the City of Philadelphia?

A. Well, this one company that has just swung over to this particular type serves, taking Philadelphia as a center, westward twenty miles, eastward to the Atlantic Ocean, including Atlantic City and all the resorts south from Atlantic City to Cape May, a number of resorts along
2372 there in Cape May County; they go south, including Delaware, Wilmington, Baltimore and Washington using this container.

Q. Are these municipalities you have referred to in which milk is sold in these containers places where they have milk inspection and milk ordinances?

A. Yes, every one of them.

Mr. Schaefer: That is objected to.

By Mr. Rall:

Q. The officials in some of these places that you mentioned are officials with whom you have had conferences in connection with milk?

A. Yes, I know most of them in that area. In fact, they have very good milk laws.

Mr. Schaefer: I move to strike that out as not responsive to anything.

By Mr. Rall:

Q. State whether or not from your personal knowledge of the opinion of these various public health officials in the communities that you have mentioned, the container which is Plaintiff's Exhibit 2 is accepted by them as being a proper sanitary standard container for the sale of liquid milk at retail.

Mr. Schaefer: That is objected to upon the ground
2373 it is not the best evidence, that it is hearsay, that it is incompetent, and upon the further standing objection that it is immaterial.

Mr. Rall: Will you read the question?

(The question was repeated by the Reporter as follows: "Q. State whether or not from your personal knowledge of the opinion of these various public health officials in the communities that you have mentioned, the container which

is Plaintiff's Exhibit 2 is accepted by them as being a proper sanitary standard container for the sale of liquid milk at retail.")

A. In practically every one of the communities I know the milk law, what it calls for, and know that in every one of those communities that this package is accepted, and openly and freely sold, and I don't know and never heard of any prosecution having been instituted in any one of those areas, so that I infer very strongly that it has been accepted and approved by them.

Mr. Rall: You may cross-examine.

Cross-Examination by Mr. Schaefer.

Q. Who administers public health matters in the
2374 City of Philadelphia?

A. The Director of the Department of Public Health is appointed by the Mayor, and is in charge of all public health matters.

Q. Are your regulations with respect to milk in the form of ordinances?

A. Ordinances and state laws.

Q. Does the head of the department have any authority to make regulations in this city?

A. The Board of Health under a basic act in the City of Philadelphia of 1818 has the the right to make certain rules and regulations having to do with any matter pertaining to public health, but there are specific regulations passed by our Legislature for milk, and that act of the Legislature also gives municipalities the right to make additional rules, or additional ordinances, and we have such ordinances in Philadelphia.

Q. Do you have any regulations of milk in addition to the ordinances?

A. Yes.

Q. That is, you have both an ordinance and regulations?

A. That's right. We have an act of assembly, ordinances of council, and rules and regulations.

Q. Throughout this examination I will refer to
2375 those things collectively as Legislation, so that we won't have to enumerate it every time.

A. Certainly.

Q. What does this Legislation prescribe as to grades of milk?

A. The State Act of Assembly states that any milk sold

as whole milk can only be sold if the definition of that particular grade or trade mark is registered with the Secretary of Health and approved by the Secretary of Health.

Q. And the Secretary of Health is a state officer?

A. A state officer. The Act goes further, and permits the Secretary of Health to designate any local health officer as the agent.

Q. For the purpose—

A. For the purpose of administering the State act, and at Philadelphia, of course, the director of the Department of Public Health has been designated as the agent. When you speak of grades, you mean as A and B milk? We have such grades in Philadelphia, but they are not officially recognized.

Q. What do you mean by that?

A. Other than the fact that A milk must have cover caps, and the State Department of Health will not
2376 permit any milk to be marked A unless it meets with certain grades, but in the City of Philadelphia we don't recognize grades of milk, only two grades, good milk and bad milk. It is bottled as A and B milk.

Q. But not by virtue of any official sanction by any official body?

A. That is right.

Q. The dairyman simply decides he wants to sell his milk as A milk?

A. That's right, and he files a definition with the State Department of Health in which he states he is going to have cover caps, and that he is complying with the State bacterial count. There is no mention made of butterfat.

Q. Is any effort made to determine whether or not his milk complies with the bacterial count?

A. Only with our requirements.

Q. Who makes that?

A. The City, as agent for the State.

Q. The City checks the bacteria count of all grade A milk and all grade B milk?

A. Yes.

Q. You said those grades were not officially recognized; what do you mean by that?

2377 A. Not officially recognized by the City of Philadelphia; we have never officially recognized any grades of milk.

Q. But you do check to determine compliance with bacteria count?

A. Yes, they come up to the requirements of the Department of Health at Harrisburg.

Q. Do you have the U. S. Public Health Standard Ordinance in effect here?

A. No, it doesn't follow substantially that. Generally, it does, but not officially.

Q. Do you have farm inspection?

A. Yes, the State makes the farm inspection. The City of Philadelphia makes no farm inspection, whatever, except in the case of raw milk. We have some raw milk farms, and some certified milk farms; we do inspect those farms, but not for raw milk which is pasteurized, we don't check those farms. That is done by the State.

Q. Do you make an inspection of plants and dairies?

A. Yes, that is where we concentrate, every plant that pasteurizes milk for the City of Philadelphia.

Q. Is there legislation in effect with respect to the sterilization of glass bottles?

A. Oh, yes.

2378 Q. An effort is made by the City to determine whether or not that regislation is complied with?

A. That's true, a very rigid effort is made.

Q. And you inspect that carefully?

A. That is right.

Q. You inspect the dairies carefully?

A. Yes.

Q. To determine whether or not there is compliance with the regulations concerning the handling of glass bottles?

A. That is right.

Q. What rules and regulations are in effect concerning the handling of paper containers?

A. We have practically no regulations.

Q. What regulations do you have?

A. None other than each installation is treated individually, and we have been working more or less on the rule of common sense on paper containers.

Q. That is, you have no regulations at all in the vicinity of Philadelphia pertaining to paper bottles?

A. To paper bottles, that is correct.

Q. You feel that regulations are necessary in the case of glass?

A. Yes, and I also think that regulations are necessary

in the case of paper. I think the City of Philadelphia
2379 will have such regulations before the summer is out. I was working towards that, incidentally—

Q. I haven't asked you any questions pertaining to that.

A. Yes. Well, here is what I want to explain. You see, I have not been in charge of milk for three years.

Q. Yes.

A. And I think if I had been, if I had continued on, I would have had the regulations quite some time ago. I think they should have been in three years ago.

Q. You feel they should have been in at the time the containers were first permitted here in 1929?

A. No, I don't think so. I think in a thing like that, that you have to know what you are going to do. I think the first constructive effort made to make any regulations on these containers was the 1937 conference by Breed and Sanborn. I think after that, and what developed there, that we could all have gone along and passed regulations.

Q. Regulations were just as necessary before that conference as after, weren't they, from the Public Health point of view?

A. Not necessarily. I think that you could use a certain degree of common sense on all of it. It was certainly evident at that time that virgin board was
2380 necessary. It was necessary at that time that you bottle—

Q. To what time are you referring?

A. When they first came in here, that is what we did see, that it was virgin board, and that the temperature of the wax was high enough to insure a reasonably sterile container.

Q. Has the paper container changed since 1929 to the present day?

A. Has it changed?

Q. Yes.

A. Substantially, no, except possibly they are making a little better grade of board. I don't know that the paraffin is any better.

Q. Why is it that you feel that regulations are necessary and appropriate now and were not necessary and appropriate in 1929?

A. Well, because then the industry was just starting. I think as it goes on that there will be possibly some out-

fits that may want to put second-hand material in their board—

Q. Could they not have wanted to do that?

A. They could have wanted to do that at the start, but their stake was a little bit too high, then. They real-
2381 ized they had to put good board in at that time because they couldn't substitute. It was just as cheap to buy good board then as it was to buy poor board.

Q. But the effect of poor paper stock or poor manufacture of a container from the Public Health standpoint would have been the same in 1929 as in 1936?

A. Yes, of course, somebody had to pioneer on these things.

Q. You mean nobody knew what the regulations should have been?

A. Yes, somebody had to pioneer.

Q. Somebody had to determine what the regulations ought to be?

A. That is right.

Q. You have never made any mill inspections yourself?

A. Paper mill?

Q. Yes.

A. No, sir, never been in one in my life.

Q. You never determined, then, that virgin pulp was used in the containers used here?

A. No.

Q. Where is the paper now used in Philadelphia manufactured?

A. I couldn't tell you. I am not in charge of that
2832 department right now.

Q. Where was it manufactured when you were in charge of that department?

A. As I recollect it, I think the Cherry River, if I am not mistaken, was one of the companies that produced it. I am just thinking if there wasn't another concern; the Regal Paper Company, Regal Mills, and the Sealrite Mills in Fulton, New York.

Q. They make their own paper there?

A. They make their own paper, yes, sir.

Q. Where was that paper converted when you were in charge of this work?

A. You mean converted from the blank into the bottle?

Q. Converted from paper stock into forms for bottles.

A. That occurred somewhere in Philadelphia around 10 or 12th and Race Streets.

Q. You inspected that operation?

A. Yes, we had an inspector up there, I can't remember the name of the place.

Q. What did the inspector up there do?

A. He found that the stuff was handled in a sanitary manner.

Q. I mean specifically what did he do?

A. That I can't tell you.

2383 Q. Who was that man in 1936?

A. That was Dr. Behrens, I think, who went up and made that inspection. He went there regularly. He is no longer with the City.

Q. Where is he now?

A. I don't know where he is now, I can't tell you.

Q. Did he make that inspection under your supervision?

A. That's right.

Q. Does he still live in Philadelphia?

A. I believe so. I haven't seen him since he left the City's service—

Q. He isn't employed by the City?

A. He left the service in the latter part of 1936. I have not seen him since.

Q. Do you know what he did there when he was making his inspections?

A. No, sir, I can't tell you specifically what he did. I didn't watch him.

Q. He was making those inspections under your supervision?

A. That's right.

Q. What were Dr. Behrens' initials?

A. E. E., I think; Edward E.

Q. Now, what investigation was made in 1929 be-

2384 fore the use of paper containers was permitted?

A. The first container in Philadelphia was the Sealrite from Fulton, New York. That's a bottle that is manufactured at the plant at Fulton, New York, and shipped down in cartons. We were primarily interested in whether or not the containers as they were filled with milk were sterile, or what their bacteriological condition was, and we took in a number of cartons that were shipped in from Fulton to give to our laboratory, and we took a

number of cartons at random from the Sealrite warehouse in town here, and ran them through our laboratory.

Q. What test did you use?

A. Merely a wash test, washed them out with—

Q. Will you describe that test?

A. I can't. I didn't see it done. The laboratory worker can describe that test.

Q. What were the results of those tests as to bacterial count?

A. Well, now, quoting from memory, of, I think, three hundred containers that were done, the average bacterial count was slightly less than two colonies, and I think about forty per cent of them showed sterile. That is quot-
2385 ing from memory. I think that is substantially correct.

Q. You spoke of successful and unsuccessful installations of paper containers. What was the trouble with the unsuccessful ones?

Mr. Rall: I don't recall any such testimony.

Mr. Schaefer: I think you will find it.

The Witness: Yes, I would like to have it. If we could find that and put it into the rest of the testimony here, I can explain it. I don't—

Mr. Schaefer: Will you check that, Mr. Reporter?

Mr. Rall: I suggest we have a five minute recess while he is doing that.

(Recess for five minutes at 11:10 o'clock A. M.)

Mr. Schaefer: Will you read that part of the testimony, Mr. Reporter, please?

(Testimony was repeated by the Reporter as follows:

"Q. What study, if any, have you made, or investigation of the subject of the use of paper containers for the sale of liquid milk?

2386 A. I have been pretty much interested in the use of single service containers for milk ever since I have been identified with milk inspection work, and since Philadelphia is possibly one of the pioneer cities of paper bottles and had for a long time one of the few successful installations of paper bottles in our city, I had an opportunity to see just how it worked out with not only the containers but with the public reaction, and public health.")

Mr. Schaefer: Now, the question I asked a few minutes ago.

(The question was repeated by the Reporter as follows:

"Q. You spoke of successful and unsuccessful installa-

tions of paper containers. What was the trouble with the unsuccessful ones?")

Mr. Rall: I object, because he did not speak of any unsuccessful; his testimony was that Philadelphia had one of the successful installations.

By Mr. Schaefer:

Q. Were there any unsuccessful installations?

A. In Philadelphia, no.

Q. Were there any anywhere?

2387 A. Yes, I will tell you of an unsuccessful installation. I want to be fair in this matter. What I consider was an unsuccessful installation was in York, Pennsylvania. That is immediately west of here about sixty or eighty miles. They took paper bottles on there and put them on door steps to replace glass bottles without any attempt whatever to study the problem, and it was unsuccessful. They did learn a lot by experience. So, there is an unsuccessful installation.

Q. That is the only one?

A. That is the only one I knew of. All the others have been exceptionally successful, in my estimation.

Q. Is door to door delivery of paper containers in effect in Philadelphia now?

A. No, sir, not as a general rule. There may be some few cases of door to door delivery, but very few. We don't encourage it.

Q. Why not?

A. We feel that the paper bottle in milk sales is essentially a store proposition where you have to take advantage of your temperature and the insulation of your paper. Unfortunately, if you allow the heat to get into a cold bottle of milk in paper, it is rather difficult to get the

2388 heat out again, and that, of course, is what happens if you put a bottle of milk on a doorstep early in the morning and leave it there during the summer weather until the housewife gets up several hours later and takes it in. Unless the milk dairies go to daylight delivery where they can make a reasonably prompt transfer from refrigerated truck to home refrigerator, we are not in favor of doorstep delivery.

Q. Do you have much trouble with picking up glass bottles from dumps here in Philadelphia?

A. Yes. I dare say I still get an average of fifty requests a month from unemployed persons for permits to

pick glass milk bottles from dumps and sell them back to the dairies, or milk exchange.

Q. And that is a real problem here, is it?

A. Yes.

Q. What is the value of your sales in paper and glass?

A. I can't give it to you up to date, except approximately. There are about eight hundred thousand quarts per day household milk. I should say ten per cent of that is paper. They are rough figures. They are subject to change by Dr. Yunker, if you call Dr. Yunker. He may be able to give you that information.

Q. How many milk borne epidemics have you had
2389 in Philadelphia in the last ten years?

A. Fortunately, none. We had no milk borne epidemics in Philadelphia in the last ten years.

Q. What percentage of epidemics of contagious diseases are usually traced to their source?

A. Very few. Typhoid, generally, yes; Scarlet Fever and the other streps, no, you don't find the source. Typhoid is the only one we have any degree of success in tracing down to its source.

Q. How would it be possible to trace an outbreak of an epidemic of a contagious disease to a paper milk container?

A. Well, very frequently you do find a Scarlet Fever epidemic as a result of a dairyman, or a handler on a farm.

Q. Of course, the contamination that you get there will be—

A. All along the line, that is due to the absence of pasteurization.

Q. How would you trace it to a single container?

A. You could not trace it to a single container. When I said we had no contagious diseases traced to any paper milk container during my time with a hundred and fifty million of them, we didn't have any traced to glass, that is true, too, none of them.

2390 Q. Is it a routine matter when you are attempting to check contagious diseases and their source, to ascertain whether paper or glass is used?

A. Yes, it is. Our medical inspectors investigate in every case of reportable communicable disease, and that takes in the whole list of them. It is practically the same in all municipalities. One of the questions always asked by our medical inspectors is, "What dealer do you get your milk from?" And whether it is glass or paper,

because some of them do sell some small quantity in paper, so that we always check as to whether it is paper or glass. They did that at my request; the chief of that division did that at my request back eight or ten years ago.

Q. But in the case of a single contaminated container, would it be possible as a Public Health proposition to trace the source of an outbreak of diseease, or a single case of disease?

A. I wouldn't say a single case, no, but as a group of cases you could trace back to the particular milk dealer.

Q. But there would be no possibility in the case of a single container?

A. No.

2391 Q. Do you make reports on infant diarrhea?

A. Yes, that is made to—

Q. Is that a part of your work?

A. No, it doesn't come under my division. It comes under the division of child hygene. I don't get those reports except where there is any trouble, then it is brought up at the staff meeting.

Q. That is as a routine matter during the time you were administrator of the milk regulations in the City of Philadelphia you did not get reports of cases of infant diarrhea?

A. No, except where it would get out of line, and then I would get the reports; I mean, it would come up at the staff meeting if it ran more than usual.

Mr. Schaefer: All right, thank you, Mr. Packer.

Redirect Examination by Mr. Rall.

Q. Just a couple of questions. You stated that there are no legislative regulations as to paper bottles. Are there legislative regulations with respect to containers, generally, in which milk may be sold at retail in the City of Philadelphia?

A. Well, now, there is in the new ordinance that
2392 has come in since I let go of the milk division. There is a regulation now in our ordinance that requires that all milk containers and all milk caps, and all milk product containers shall be approved by the Director of the Department of Public Health, and shall be reviewed by our Board of Health.

Q. And at this time there is a large collection of glass containers of all types and paper containers of all types

over at the Department of Health in Dr. Yunker's office which have been submitted for approval?

A. That is correct. They have all been submitted to the Board of Health. I was at the Board meeting, I remember; I believe a number of bacterial tests were made on some new containers that came in at that time, and they have all been reviewed by the Board and approved by the Director.

Q. Does that include a container of the type of Plaintiff's Exhibit 2?

A. Yes.

Q. You stated that you did not make any determination that virgin spruce was used in the manufacture of paper board which went into the paper bottles that constituted your original installation here. Do you mean by that, that you did not personally visit the mill—

2393 A. That's right.

Q. Did you make an inquiry?

A. We made inquiry, but we did not personally visit the mill.

Q. What inquiry did you make in regard to that?

A. From the representatives of the mill, and they told us it was, and we accepted their word.

Q. The bacteriological tests that were made showed a carton reasonably free from bacteria?

A. That is right.

Mr. Rall: That is all.

Recross Examination by Mr. Schaefer.

Q. What do you mean by reasonably free from bacteria?

A. Even virgin spruce board will show some contamination which, strange as it may seem, you can't get below five hundred colonies per gram, we will say, as a standard, but where you use second-hand stock, you can't get anywhere near that, you have a much higher bacteria content. The laboratory can immediately tell whether it is spruce board or not.

Q. You mean by—

A. A microscopic examination will show it.

Mr. Schaefer: That is all, Mr. Packer.

2394 Mr. Rall: Thank you very much.

(The signature of the witness was waived.)

ELKAN H. YUNKER, having been duly sworn, was examined and testified as follows:

Mr. Rall: To save time, the plaintiff agrees that all objections to the materiality of any testimony during this deposition may be made when the deposition is offered in evidence without the necessity of counsel at this time interposing such objection.

Mr. Schaefer: All right.

Direct Examination by Mr. Rall.

Q. Will you state your name?
A. Elkan H. Yunker.
Q. And your address?
A. 2344 North 18th Street.
Q. Philadelphia?
A. Philadelphia.
Q. How old are you?
A. 57.
Q. What is your business or profession?
A. Veterinarian.
2395 Q. Do you occupy any official position?
A. Chief of the Division of Milk, Livestock, Meat and Food, Bureau of Health.
Q. Of the City of Philadelphia?
A. City of Philadelphia.
Q. Will you state just briefly what your education has been?
A. After finishing grammar schools, I graduated from the University of Pennsylvania in the Veterinarian course, and engaged in practice for twelve years, and then was with the State Department of Agriculture, Burean of Animal Industry, in the control and eradication of infectious diseases in livestock, and then resigned from there to go with the City of Philadelphia in the position of a field man, you might term it.
Q. When was that?
A. I engaged with the State Department of Agriculture in 1918, and came with the City of Philadelphia in 1926.
Q. When did you become chief of the division you mentioned?

A. I was field agent up to 1936; then I was made supervisor of meat inspection in the division, and in September of last year became chief of the division.

Q. I show you a dummy bottle that has been
2396 marked plaintiff's Exhibit 2. Will you state whether or not paper milk bottles of that type are used in the sale and delivery of milk in the City of Philadelphia?

A. They are.

Q. Do you know the extent of that use, either the quantity or the percentage of the total sales in the City that are in that form?

A. I am not in a position to answer that question.

Q. Do you know whether or not this type of container is used outside of the City of Philadelphia?

A. It is used in the City and around the City of Philadelphia, in the State of New Jersey, down at the seashore, Atlantic City, Wildwood, Ocean City; all those places use this container. They are bottled principally in Philadelphia.

Q. State whether or not the use of this container in the City of Philadelphia has official approval.

A. The container has the official approval of the Department of Health.

Q. What company uses this container in Philadelphia?

A. The Sylvan Seal Company uses this type of container.

Q. Have you had any complaints about milk or cream being absorbed by the fiber of the container?

2397 Mr. Schaefer: That is objected to upon the ground of immateriality, and upon the additional ground that such evidence is not competent upon the question of whether or not the container is absorbant.

By Mr. Rall: Q. You may answer, subject to the objection.

A. I have not.

Q. Have you, yourself, used containers of this type in the home?

A. At times, yes; not steadily, but at times.

Q. It is sold largely through stores, is it not?

A. Principally through stores. I don't know of any house to house delivery at the present time with the paper container.

Q. To your knowledge, how long has a container of this type been used for the sale of milk in Philadelphia?

A. This container was approved officially on April 5,

but had been in use in Philadelphia—it had been approved prior to that time; I mean a similar container had been approved prior to that under Mr. Packer's regime, and just what time that happened I am not familiar with, but this container here was officially approved on April 5, of this year, at which time we approved a number of containers.

Q. Is that under the ordinance that Mr. Packer
2398 referred to that now requires the submission for approval of every container?

A. That's right. Our new milk ordinance of 1937 requires all milk containers, all caps, and all printing matter to be approved by the director of the Department of Public Health.

Mr. Rall: That is all.

Cross-Examination by Mr. Schaefer.

Q. You mentioned a date in April; what year is that?

A. 1939.

Q. Did you go with the state immediately after you finished your university work?

A. No, I said I was engaged in practice for twelve years after I graduated.

Q. When did you finish at the University?

A. 1906 I graduated, and I went with the State in 1918, and in 1926 I went with the City.

Mr. Schaefer: That is all, Doctor.

(The signature of the witness was waived.)

2399 FLORENCE JOHNSTON, having been duly sworn, was examined and testified as follows:

Mr. Rall: To save time, the plaintiff agrees that all objections to the materiality of any testimony during this deposition may be made when the deposition is offered in evidence without the necessity of counsel at this time interposing such objection.

Mr. Schaefer: All right.

Direct Examination by Mr. Rall.

Q. Where do you live, Miss Johnston?

A. 3909 Fairmount Avenue, Philadelphia, Pa.

Q. What is your business or profession?
A. Bacteriologist for the Board of Health.
Q. How long have you been in that position?
A. I have been bacteriologist for one year. I have been in the laboratory for seven years.
Q. Previous to your becoming bacteriologist, what were your duties with the laboratory?
A. I was a technician.
Q. A laboratory worker?
A. Yes.
Q. What schools or universities did you attend?
A. I graduated from Temple University in Phila-
2400 delphia. Before that I went to the West Philadelphia High School.
Q. Did you receive any degree from Temple?
A. Bachelor of Science.
Q. What was the general nature of the course that you took?
A. I majored in science.
Q. As bacteriologist, under whose direction do you work?
A. I work under Dr. John Laird.
Q. The head of the laboratory?
A. Right.
Q. And Doctor of Medicine?
A. Yes.
Q. I show you a carton that we have marked here for the record Plaintiff's Exhibit 2, and ask you whether you have had occasion to examine in your work cartons of similar type.
A. Yes.
Q. When was that?
A. Well, January 25, and March 15th, and the week of December 25th; it was the last week in December, I haven't the exact date.
Q. How many cartons, and how were they obtained?
A. We received ten cases of cartons with twelve con-
tainers in each case, and I took one carton out of
2401 each case.
Q. In what form were the cartons when you received them?
A. Like this (indicating), closed with a seal over it.
Q. In other words, it was a carton in the same shape that it is when milk is delivered, except that it had no milk in it?

A. No.
Q. And never had milk in it?
A. No.
Q. In other words, the cases of the cartons you received consisted of milk bottles which were in about the same condition as Plaintiff's Exhibit 2?
A. Yes.
Q. They had been paraffined?
A. Right.
Q. What did you then do with the cartons that you chose at random?
A. I put 99 cc of sterile distilled water in the carton, closed the seal again, and shook it twenty-five times, and then pipetted one cc of water from the carton on a petrie dish.
Q. Will you explain what a petrie dish is?
A. A petrie dish is a round glass dish covered with a clay top to absorb moisture, and then I poured 10
2402 cc's of Agar on to the water, and shook it so it would be disturbed and incubated at 37 degrees for forty-eight hours, and then counted it.
Q. Is that procedure that you have outlined the standard laboratory technic for bacterial counts in milk containers?
A. Yes.
Mr. Schaefer: I object to that upon the ground the witness is not qualified to say.
By Mr. Rall:
Q. You are acquainted with the requirements of the Public Health Service of the United States Government?
A. Yes.
Q. With respect to laboratory technics?
A. Yes.
Q. And the procedure that you have outlined is generally accepted?
A. Yes.
Q. As the proper method of determining bacteria counts on empty milk containers, is that correct?
A. Yes.
Q. Do you have with you the record of what your examination made as you have just stated disclosed?
A. Yes.
Q. Will you state what that was?

2403 A. The results from the examination of the ten—

Q. You have testified, Miss Johnston, to having made successive tests.

A. Yes.

Q. We are interested in knowing when you give us the results of the tests, when you made the particular test.

A. I can't give the exact date on these; it was the last week in December.

Q. Of 1938?

A. Yes.

Q. Was that the test where you had the ten cases and took one from each case?

A. Right.

Q. Will you state where that test was made?

A. In the laboratory of Hygene, Front and Luzerne.

Q. Do you have a street address for that?

A. No, it is a corner, northeast corner.

Q. State what the result of the test was that you have just referred to.

A. One carton showed one colony, but other cartons showed no colonies.

Q. From your experience in the examination of empty milk containers, is that a high or a low bacterial count?

A. That is low.

2404 Q. Now, you referred to some later tests. What were those, and how did you conduct them?

A. They were conducted in the same way, the carton was sent in along with samples of milk from that particular dairy that uses the carton, and on January 25, one carton was examined, and the count was zero; on March 15, one carton was examined, and the count was zero.

Q. How were these cartons obtained, if you know?

A. The milk inspector goes to the dairy and collects samples during the process of pasteurization, and takes also, an empty carton or an empty bottle.

Q. Are the tests you referred to tests of an empty bottle, or of a bottle which had had milk in it?

A. No, it was empty, before use. It was tested for sterilization of the bottle or container.

Q. Have you made any examination since the Sylvan Seal Milk, Incorporated, started to use this Pure-Pak container? Have you made tests of the bacteria counts of the milk, itself?

A. Yes.

Q. That has extended over a period of six or eight months, has it?

A. Yes, to January and March; before that it was out of the six months' range.

2405 Q. They were using Sealcone?

A. Sealcone. They still use the Sealcone, but they also use this (indicating).

Q. How often do you make bacterial counts on milk of the Sylvan Seal Milk, Incorporated?

A. In March and January; that is, two months lapsed there. I don't believe it is periodic, just when the milk inspector goes through with this.

Q. Do you know about how many tests you have made since they started using this container?

A. Just the two.

Q. January and March?

A. January and March.

Q. What were the results of those tests?

A. Of the empty container?

Q. No, pardon me, I am referring, now, to the test of the milk bacteria counts of the milk, itself. Will you explain just what you did to make the tests on the milk?

A. The milk would come in in the container, and after being shaken twenty-five times, one cc of milk was pipetted into 99 cc's of sterile distilled water, making a dilution of one to a hundred. That bottle was shaken, and one cc

2406 was pipetted into a petrie dish, agar is poured into the plate, and then incubated for forty-eight hours, and counted. The count in January on A milk was 200; that is, 200 per cc of milk, and on B milk it was 3100.

Q. Are you acquainted with the permissible bacteria limits on milk?

A. 30,000 for A milk, and 50,000 for B milk.

Q. These tests that you have referred to were well within the limit of bacteria count?

A. Within the limit.

Q. Are there any other tests you have a record of?

A. On March 15 the A milk gave a count of 100 per cc; B milk, 1300 per cc.

Q. Were those bacterial counts high or low?

A. They are low, lower than the January.

Q. Did you make that test in the same way you have described the milk test?

A. Yes.

Q. Do you know whether or not the method that you

used for making the test on the milk is a standard accepted method of making such tests?

A. Yes.

Q. So far as you know, is it the standard used throughout the country by Public Health laboratories?

A. I don't know what others use.

2407 Mr. Rall: That is all.

Cross-Examination by Mr. Schaefer.

Q. You testified to a dilution of one to one hundred; how many bacteria colonies would you have to have per cc in order to show in a test made that way?

A. I don't understand what you mean.

Q. You have a dilution of one to one hundred.

A. Yes.

Q. How many bacteria would you have to have per cc in order not to find sterility under that test?

A. You would have to have less than one colony.

Q. Per what?

A. Per cc.

Q. Or you would show sterility?

A. Yes—now, wait a minute, no; that is one colony per one hundred. The dilution is one to hundred, and one colony is from that dilution, which would make it one hundred count per cc; so, anything under a hundred per cc would show sterility.

By Mr. Rall:

Q. That is, anything under a hundred undiluted would, after you diluted it?

A. Yes. Our lowest dilution is one to a hundred.

2408 Mr. Schaefer: That is all.

Redirect Examination by Mr. Rall.

Q. I just want to clear up that one point, I am not sure that it is clear on the record. Before you dilute 1 cc of milk with 99 cc of distilled water—

(Discussion off the record.)

Cross-Examination (Resumed) by Mr. Schaefer.

Q. What is your dilution of the rinse container?

A. There is no dilution.

Q. Will you describe that test again?
A. We use 99 cc of water.
Q. Yes.
A. And take one cc from it, so it is colony per cc.
Q. How many colonies would you have to have in that test in order not to show sterility?
A. One.
Q. One per cc?
A. Yes.
Mr. Schaefer: That is all.

Redirect Examination (Resumed) by Mr. Rall.

Q. Your testimony previously was directed to the
2409. milk test, you thought that Mr. Schaefer was then asking you about the dilution of milk?
A. Right.
Q. And you are now talking about the rinse test for the carton?
A. The carton.
Mr. Rall: That is all. May we adjourn to 1:30, please?
Mr. Schaefer: Yes.
(The signature of the witness was waived.)
(Recess, 11:55 A. M. until 1:30 P. M.)

After recess.

Present: Counsel as before noted.

A. E. CARPENTER, having been duly sworn, was examined and testified as follows:

Mr. Rall: To save time, the plaintiff agrees that all objections to the materiality of any testimony during this deposition may be made when the deposition is offered in evidence without the necessity of counsel at this time interposing such objection.
2410 Mr. Schaefer: All right.

Direct Examination by Mr. Rall.

Q. Will you state your name, please?
A. A. E. Carpenter.
Q. What is your address, your business address?

A. 612 South 24th Street, Philadelphia.
Q. How old are you?
A. 50 years old.
Q. By whom are you employed?
A. Sylvan Seal Milk, Inc.
Q. What is the business of that company?
A. The business of that company is the processing, manufacture and distribution of milk and milk products.
Q. What plants does the company have?
A. It has a plant in Philadelphia at the address I stated, and one in Baltimore.
Q. Where does it sell its milk?
A. Do you want to know the Baltimore address?
Q. No, just the general territory in which it sells its milk.
A. Well, the milk from the two plants, of course, the geopraphical area is divided. Suppose I give you the Philadelphia area first.
2411 Q. That's fine.
A. We deliver milk daily, every day in the year except Sundays, to all of the Philadelphia area, City of Philadelphia, the City of Trenton, New Jersey; the City of Camden, New Jersey; Atlantic City, New Jersey; and to practically all of the towns and villages in southern New Jersey.
In addition, we deliver milk to the City of Wilmington, Delaware, from that plant, and west of Philadelphia a distance of approximately 50 miles to all the villages and towns in that area.
Q. Are these many or few separate towns that you are referring to?
A. Well, there are a great many towns.
Q. And how about the Baltimore area?
A. From our Baltimore plant we deliver milk to all of the City of Baltimore, and to the City of Washington, and the suburbs of the City of Washington, and also the towns that may be distributed between Baltimore and Washington.
Q. I show you what we have marked on this record Plaintiff's Exhibit 2, and ask you whether your company is now distributing milk in packages of that type.
A. You are referring to the package, or what is
2412 marked on the package?
Q. No, I am just referring to the type of the package.

A. Yes. We are now distributing milk in packages of similar type.

Q. How long have you been doing that from your Baltimore plant?

A. Two years, exclusively.

Q. What machinery do you use in the Baltimore plant for the filling of these containers?

A. We use the machine built by the Ex-cell-o Corporation, which manufactures what is known as the Pure-Pak container.

Q. Which is the container you have in your hand?

A. Which is the container I have in my hand.

Q. In your Philadelphia plant what machinery do you use?

A. We now use this same container and these identical machines, exclusively.

Q. How many machines do you have in Philadelphia?

A. Three.

Q. And how many in Baltimore?

A. One.

Q. What is the approximate capacity of your Philadelphia plant?

A. The approximate capacity of our Philadelphia plant is 120,000 quarts a day.

2413 Q. Since you have been selling milk in Philadelphia in this Pure-Pak container, have you sold a great quantity or a small quantity, or about how much? Just a rough approximation.

A. Well, we have sold hundreds of thousands.

Q. Of quarts?

A. Of quarts.

Q. Will you describe briefly the process by which your Pure-Pak machine manufactured by Ex-cell-o forms, paraffins, and fills and seals these containers?

A. I am not an engineer, but I can tell you approximately how the thing is done.

Q. All right.

A. The flat paper blanks printed are fed into the machine on a tray, about fifty at a time—

Mr. Rall: I will interrupt. Will you sign that?

(A flat paper blank for a milk container was marked Plaintiff's Exhibit 3, and signed by the Notary.)

By Mr. Rall:

Q. I show you Plaintiff's Exhibit 3. When you refer to a flat blank, it is this type?

A. That is exactly what I refer to.

2414 Q. Now, continue.

A. The machine automatically forms this blank into a paper container by sealing the bottom. The machine then automatically immerses the paper container into a paraffin bath heated to 177 degrees—

By Mr. Schaefer:

Q. Just a moment. What are you reading?

A. I am reading from notes which I got from my chief engineer within the last hour. I had him check up specifically, particularly as to the degrees of temperature which we were running now, and which is usual. I am an executive vice-president of the company, and I would have to refer to my technicians.

Q. That is, you are not testifying from your own knowledge?

A. Well, I know that this is approximately so; these figures are approximately so.

By Mr. Rall:

Q. You saw the thermometer yourself yesterday with me, didn't you?

A. Yes, I am watching the thermometer all the time. As a matter of fact, the reason I am giving the figure of 177 degrees is because that was the figure that was on the thermometer today, whereas sometimes it is 180 de-

2415 grees, sometimes it is 185, and it might be 176. I wanted to get the exact precise figure today. That is why I checked these within the last hour with our chief engineer. As a matter of fact, I went out there and helped him do it myself, and saw him do it myself. I didn't want to have any mistake about it.

Q. Continue.

A. Heated to 177 degrees Fahrenheit, and drains—the package drains in a heated chamber at the same temperature. The package is in that chamber a total of 23 seconds. As a matter of fact I clocked that myself within the last hour on the machine in commercial operation. The machine then cools the paraffin container in a cooling unit; it is automatically carried from the paraffin chamber to the cooling chamber, to 40 degrees temperature Fahrenheit.

Q. How long does that cooling process take?

A. I believe it is in there about three or four seconds, something like that; I am not quite sure, I haven't got that figure, but that is my best recollection.

Q. It remains in the cooling chamber from the time it leaves the bath until it goes to the filler?

A. It moves automatically; consequently, the period in the refrigeration chamber is approximately, I would
2416 say, seven seconds, on its way to the filler. The bottle is then automatically filled in the machine with an automatic measuring device.

Q. Is the paper container used for the purpose of measurement in any way?

A. The paper container, itself?

Q. Yes.

A. No, it is an automatic mechanical device. As a matter of fact, that automatic mechanical device has a maximum variation of two centimeters per quart, which is very close.

Q. After the milk is in the container, then what is done with it?

A. After the milk is in the container, it moves along automatically on a chain to the spot where the top is folded by machinery, at which point after folding a pre-heated sterilized wire staple is inserted.

Q. Does that operation on your machine result in the same sort of a seal at the top, and staple, as on Plaintiff's Exhibit 2?

A. Precisely the same.

Q. One edge of the carton is folded over the top, is it not?

A. That is correct.

2417 Q. Then what is done with the filled cartons?

A. It is at that point filled, the top is closed, sealed with the staple in it. It continues along to the little platform where it is taken by the operator and put into paper cartons, twelve per carton.

Q. And these cartons are sealed?

A. These cartons are sealed.

Q. With an adhesive strip?

A. They are sealed with an adhesive strip, so that they are completely sealed, the whole carton is sealed. They travel from there to the cold box on an automatic electric conveyor.

Q. Are the municipalities in which you sell milk and cream ones which regulate the inspection, sanitation and handling of liquid milk and cream through their health departments?

Mr. Schaefer: I object to the competency of that.

By Mr. Rall:

Q. You may answer, subject to the objection.

A. They certainly do. In our Philadelphia plant, alone, we are under at least fifty-five different distinct health officers and jurisdictions.

Q. Have the sales which you have made in these 2418 municipalities in the Pure-Pak container met with the approval and consent of the health authorities?

A. All of them?

Mr. Schaefer: I object to that.

The Witness: All of the fifty-five.

Mr. Schaefer: I object to the competency.

By Mr. Rall:

Q. Do you have photographic copies of certain permissions received from a few of the municipalities for the sale of your product in these containers?

A. Yes.

Q. Are you able to tell us whether or not those are true and correct copies?

A. Yes, I am.

Q. Photographic copies of the originals?

A. Yes, I am.

Q. Do you know where the originals now are?

A. We have them in our possession.

Q. Would you be willing at the time of the trial to send the originals to us if we will substitute copies for you?

A. If you insure their return to us, we will be glad to.

Mr. Rall: Will you mark these Paintiff's Exhibit 2419 5, and so on?

(Copy of letter from Herbert M. Packer to the Silver Seal Dairy Products Company dated November 27, 1936, was marked Plaintiff's Exhibit 5.

Copy of letter from Dennis J. Sullivan to Edward R. Fuller, President, Silver Seal Dairy Products Co., was marked Plaintiff's Exhibit 6.

Copy of letter to Mr. Fuller, President of the Silver Seal Dairy Products Co. from John C. Foote, Milk Inspector of the City of Wilmington, was marked Plaintiff's Exhibit 7.

Copy of letter from W. K. Moffett, Director of the Bureau of Milk Sanitation, Harrisburg, Pa., to Silver Seal Dairy Products Co., was marked Plaintiff's Exhibit 8.

Copy of letter was marked Plaintiff's Exhibit 9.

Copy of letter from George W. Grim, Milk Control Officer of Milk Control District Number 1, to Silver Seal Dairy, was marked Plaintiff's Exhibit 10.

Copy of letter from Huntington Williams, M. D., Commissioner of Health, Baltimore, to Edward R. Fuller, President, Maryland Seal Dairy Products Corp., was marked Plaintiff's Exhibit 11.)

2420 By Mr. Rall:

Q. I show you Plaintiff's Exhibit 5, purporting to be a letter from Herbert M. Packer to the Silver Seal Dairy Products Company dated November 27, 1936; is that the same company, or its predecessor?

A. It is the same company; the name was changed, that is all.

Q. From Silver to Sylvan?

A. From Silver Seal Dairy Products Company to Sylvan Seal Milk.

Q. But it is the same company?

A. It is the same company, no change otherwise whatsoever.

Q. At the time that letter was written did the City of Philadelphia have any form of permits for milk containers except simply by correspondence? In other words, what is the evidence that you have—

Mr. Schaefer: I object.

By Mr. Rall:

Q. —of the approval by the City of Philadelphia of the use of the Pure-Pak container?

A. My recollection is that we have a letter of approval by the City of Philadelphia for the use of that container.

Q. Is this the letter you are referring to? (Indicating.)

2421 A. This is the letter that I am referring to specifically for that purpose.

Q. And no other permit was granted at that time?

Mr. Schaefer: I object to leading, and to any further leading.

By Mr. Rall:

Q. Was there any other different permit issued than is stated in that letter?

A. Not to my knowledge.

Q. I show you Plaintiff's Exhibit 6, purporting to be a letter from Dennis J. Sullivan, Deputy Health Officer of Jersey City, New Jersey. State whether or not that is a

photographic copy of a letter bearing the signature of Mr. Sullivan.

A. Yes, it is.

Q. Did you receive any permit other than that letter to sell milk in these containers in Jersey City?

A. No, not to my knowledge.

Q. I show you Plaintiff's Exhibit 7, purporting to be a letter to Mr. Fuller, President of your company, from John C. Foote, Milk Inspector of the City of Wilmington, and ask you whether or not you received any permit other than that for the sale of milk in Wilmington in these containers?

2422 A. Not to my personal knowledge.

Q. You were an official of the company at the time this letter was received, were you?

A. I was.

Q. Did you see the letter at or about the date it bears?

A. I did.

Q. Are you acquainted with the signature of Mr. Foote?

A. I know Mr. Foote personally, and I recognize his signature.

Q. And that signature is a photograph of his signature, on Exhibit 7?

A. That is correct.

Q. Plaintiff's Exhibit 8 purports to be a letter from W. K. Moffett, Director of the Bureau of Milk Sanitation. When was the original of that letter received, if you know?

A. Of the Director of Sanitation of the Commonwealth of Pennsylvania at Harrisburg.

Q. When was that letter received?

A. December 1, 1936.

Q. It is dated that day; was it received at that time?

A. It was received within a day or two.

Q. Did your company receive any other permit for the sale of milk in the Pure-Pak containers in the

2423 State of Pennsylvania?

A. Not to my knowledge.

Mr. Rall: I am withdrawing Plaintiff's Exhibit 9.

By Mr. Rall:

Q. I show you Plaintiff's Exhibit 10, purporting to be a letter from George W. Grim, milk control officer of Milk Control District Number 1, dated December 2, 1936. Are you acquainted with Mr. Grim's signature?

A. Yes, and with Mr. Grim, personally.

Q. Will you tell us briefly for the record what Milk Control District Number 1 consists of?

A. Milk Control District Number 1 consists of the territory continuous to the Main Line of the Pennsylvania Railroad, running from Philadelphia directly west for about fifty miles, including all the towns contiguous to the railroad.

Q. Did you receive any permit from Milk Control District Number 1 other than that letter?

A. Not to my knowledge.

Q. I show you Plaintiff's Exhibit 11, purporting to be a photograph of a letter from Huntington Williams, M. D., Commissioner of Health, Baltimore, dated January 5, 1937; are you acquainted with Dr. Huntington Williams'

2424 signature?

A. I am acquainted with Dr. Williams' signature, and with Dr. Williams personally.

Q. Is that a photograph of a genuine signature?

A. It is.

Q. When was that received?

A. About January 5, 1937.

Q. The date it bears?

A. The date it bears.

Q. Did you receive any permit from the city of Baltimore approving the use of this Pure-Pak container other than that letter?

A. Not to my knowledge.

Mr. Rall: I deliver Exhibits 2, 3, 5, 6, 7, 10 and 11 to Defendants' counsel for use in cross-examination, and intend to produce the originals on the trial, and then by comparison show that they are the same.

By Mr. Rall:

Q. Have you had any complaints from your customers, or from any health authorities about the absorption by the Pure-Pak container of the milk or cream contained in it?

Mr. Schaefer: That is objected to one the ground

2425 that the testimony which would be adduced by complaints of health authorities cannot be adduced from this witness and be the best evidence.

By Mr. Rall:

Q. You may answer the question, subject to the objection.

A. No complaints of that character whatsoever since

we have been using the Pure-Pak container from either the health departments or the consumers.

Mr. Rall: You may cross-examine. I will offer these exhibits that have been marked, and that I have submitted to you.

Cross-Examination by Mr. Schaefer.

Q. In your experience, Mr. Carpenter, do all municipalities manifest official permission to distribute milk in the manner indicated in these exhibits?

A. Let me understand your question correctly. I don't quite get your question.

Mr. Schaefer: Will you read the question?

(The question was repeated by the Reporter as follows: "Q. In your experience, Mr. Carpenter, do all municipalities manifest official permission to distribute milk in the manner indicated in these exhibits?")

2426 A. I want to answer that exactly. Did you say—repeat that once more,

(The question was repeated by the Reporter.)

A. All of the principal municipalities do.

By Mr. Schaefer:

Q. That is, in your experience, they usually do it by a rather chatty letter addressed to an official of the dairy?

A. I would hardly consider that any of the letters that we received could be described as chatty.

Q. They ordinarily do it by sending you letters of this type?

A. They have the power to—

Q. Ordinarily?

A. They have the power to keep us—

Q. Will you just answer the question? Reread it.

(The question was repeated by the Reporter as follows: "Q. They ordinarily do it by sending you letters of this type?")

A. Yes.

By Mr. Schaefer:

Q. What is the name of the engineer who prepared the memorandum to which you referred in your direct examination?

2427 A. His name is R. T. Wetteland.

Mr. Schaefer: Will you mark this Defendants' Exhibit 1, please?

(A card was marked Defendants' Exhibit 1-A; a report

consisting of two pages was marked Defendants' Exhibit 1, and Defendants' Exhibit 1-B.)

The Witness: I only quoted from part of that.

By Mr. Schaefer:

Q. Now, I show you Defendants' Exhibit 1, 1-A, and 1-B. Are those the documents to which you referred on your direct examination?

A. What documents?

Q. Did you have any other document in your hand when you were testifying?

A. No.

Q. Then those are the documents to which you referred on your direct examination, aren't they? Are they or are they not?

A. As I recollect, I didn't refer to any documents. I referred to the specific mechanics of the course of a paper container through the Pure-Pak machine.

Q. Is that all you have to say?

A. Yes.

2428 Q. And that is what you testified was prepared by your engineer whose name you mentioned a minute ago?

A. That is right, in connection with my own observations of the machine.

Q. How did your engineer happen to write:

"Paper blank similar to Dean-Fieldcrest blank, Plaintiff's Exhibit 3, which I shall show you is placed on a tray of machine," and so on?

A. Because I have one of those blanks in the office, as we are in the habit of obtaining blanks of all—

Q. When did your engineer propose to show you that blank?

Mr. Rall: Are you talking about the typewritten part or the handwritten part?

Mr. Schaefer: I am talking about this paper.

Mr. Rall: He was referring to the pencil notation. I sent him that typewritten document.

Mr. Schaefer: Why didn't he say so?

Mr. Rall: You asked him what he was referring to in his direct examination. He said he was referring to some notes, which are pencil notes on this paper.

2429 The Witness: I didn't refer to that document at any time. There was no intention to refer to that as a document.

Mr. Schaefer: All right, that is all.

Redirect Examination by Mr. Rall.

Q. In whose handwriting is the pencil portion?
A. My engineer's.
Q. And the typewritten part was sent to you by whom?
A. By you.
Q. When?
A. This morning.
Q. By Western Union?
A. By Western Union.

Mr. Rall: I offer in evidence DEFENDANTS' EXHIBITS 1, 1-A and 1-B.

(The signature of the witness was waived.)

Lewis A. Bicking.

2430 State of Pennsylvania } ss.
County of Philadelphia }

I, Lewis A. Bicking, a notary public within and for the State of Pennsylvania, do hereby certify that the foregoing depositions of Herbert M. Packer, Elkan H. Yunker, A. E. Carpenter, and Florence Johnston, were taken on behalf of the Plaintiff in the above entitled cause in pursuance of notice served on the Defendants on April 15, 1939, at the offices of Dechert, Smith and Clark, Esqs., 1320 Packard Building, Philadelphia, Pa., that said witnesses were by me duly sworn to testify the whole truth, and being carefully examined, deposed and said as in the foregoing depositions set out.

I further certify that the plaintiff and the defendants were represented by counsel during the taking of said testimony, and that signatures to the depositions were waived, and the same has been retained by me for the purpose of sealing up and directing the same to the Clerk of the Court as required by law.

I further certify that I am not connected by blood or marriage with either of said parties, nor interested directly or indirectly in the matter in controversy.

2431 In Testimony Whereof, I have hereunto set my hand and affixed my seal of office at Philadelphia, Pennsylvania, this 16th day of May, 1939.

Lewis A. Bicking,
(Seal) *Notary Public.*

My Commission Expires Aug. 2, 1942.

2492 **Report to Dr. Herman N. Bundesen, President**
Chicago Board of Health
on
Pure-Pak Cardboard Fabricated Single Service Container for Fresh Fluid Milk.
Prepared by Dr. Lloyd Arnold.

Cardboard of a satisfactory sanitary quality can be obtained and used for this purpose. The Breed-Sanborn group have not yet established standards for microbic content of cardboard used for paper containers for milk. At the July 12, 1937 Geneva conference a tentative standard of 500 bacteria per gram of paper container stock was suggested. At a conference I held with Doctors Breed and Sanborn in Geneva on November 15th they stated that their present "standard" would be less than half of the above. It seems that a standard will be developed to allow a certain number (50 to 100) common soil spore bearing types of bacteria per gram of paper stock, all vegetative forms of bacteria will be prohibited.

A report from Doctor Sanborn is enclosed. Previous analysis shows the cardboard used for Pure-Pak containers to have on an average of 35 bacteria per gram of paper stock. A report of an operation at this mill run on November 17th last, shows an average of 28 bacteria per gram, with two samples of eleven samples sterile.

This paper stock is shipped in closed packages protected from contamination to the Chicago Carton Company, 4200 South Crawford Avenue, Chicago, for conversion into containers. These containers are cut, printed and glued,
2493 shipped to the dairy as flat blanks enclosed in tightly wrapped packages to protect them from contamination. The Chicago Carton Company maintains a sanitary plant and exercises extreme care in converting the stock to blank containers.

These blanks are fed automatically into the Pure-Pak machine. The paraffin used is U. S. Pharmocopiae X standard quality (See Detroit Testing Laboratory Report of May 8, 1936 attached). The paraffin is maintained at the high temperature possible to prevent oxidation (175—185° F.), higher temperatures are impractical because of decomposition of paraffin.

The formed and paraffin container is automatically cooled

and filled with milk and sealed on a continuous belt line system.

The sealing is very effective. Compression tests made by the University of Detroit (November 26, 1937) Engineering Laboratory are attached, including empty and filled sealed containers.

The durability of the container filled with milk and kept at 100° F. is covered by an attached report (Huffman, December 4, 1936).

Copies of the report made by Dr. Prucha on "Certain Sanitary Aspects of the Use of Paper Milk Containers" presented before the Dairy Manufacturers Short Course (November 17-20, 1937) at Urbana are enclosed for your information. A careful study was reported at the same meeting by Dr. Bartlett on "Increasing the Efficiency of Milk Distribution". A copy of this paper is also attached. Both papers have a bearing on the use of single package containers for fresh, fluid milk.

2494 I spent Friday afternoon, November 26th, with Dr. Henry Vaughn, Mr. Palmer and Dr. Meader of the Detroit Board of Health. The Risdon Dairies in Detroit started last March using the Pure-Pak container. Rinse tests and holding quality of milk was done by Mr. Palmer and proved to be satisfactory. The daily unit packages has increased from 8,000 a day last March to 40,000 a day at the present time. The product meets all requirements of the Detroit Board of Health. Dr. Vaughn and Mr. Palmer consider this package satisfactory, safe and hygienic.

I observed one day's record of the dairy in Detroit in which 42,000 containers were filled, there were 92 defective packages of this number. Upon superficial inquiry I was unable to find any complaints as to "leakers" and other defective packages in the wholesale and retail handling of this product.

From my personal investigations and observations I see many advantages to the single service paraffin coated milk containers for fresh-fluid milk. I have attached the evidence I have been able to collect to substantiate this opinion.

Lloyd Arnold.

2496 Sanborn, J. R.: Paper Mill Sanitation in Relation to the Manufacture of Food Wraps and Containers.

Reported at 33rd Semi-Annual Meeting, Geneva, New York, June 5, 1937.

Abst., Jour. of Bact., 34:347 (1937).

The making of paper containers for such a perishable and easily contaminated product as milk gives paper manufacture increased public health significance. Certain types of container board are heavily contaminated with coliform organisms; in other cases spore-bearing bacteria, miscococci, or filamentous fungi may predominate.

Uncontrolled development of microorganisms in pulp and paper mills presents serious obstacles to quality in paper wrappers and containers. Accumulation of growth as stringy or gummy masses interfere with production and result in spotting and in lack of uniformity and strength. Discoloration and decomposition processes in stored pulp or stock definitely affect quality, as well as the presence of objectionable odors, which are sometimes transferred from pulp to finished paper.

Strict microbiological control of pulp and paper operations is successful in preventing such difficulties and also sets a sanitary standard for plants engaged in fabrication and handling of food wraps and containers. Programs for control include general sanitary practices, systematic slime prevention measures, chemical treatment of process water designed to reduce bacterial numbers in pulp, and handling of sheets so as to render them suitable for direct contact with such foods as milk and meat. Wraper and container board for foods should, upon leaving a mill, conform to sanitary and bacteriological standards.

2497 Conference on Sanitation of
Paper Milk Containers
New York Agricultural Experiment Station
Geneva, New York, July 12, 1937

2498 Conference on Sanitation of Paper Milk Containers

A conference called to discuss problems of sanitation involved in the manufacture and use of paper containers for milk and cream was held at the New York Agricultural Experiment Station, Geneva, New York, on July 12, 1937. The rapid development in the use of containers of this type for milk and cream has caused many public authorities to consider whether these containers are adequately protected against contamination during their manufacture and during the interval between the time when they are completely fabricated and their closure after having been filled with milk. Nearly all of these paper containers provide uncontaminated pouring lips so that this part of the problem is usually solved with reasonable satisfaction.

This sanitation problem is a particularly pressing one in New York State because of the rapid development in the use of such containers in New York City where the City Department of Health reports that approximately one-fourth of the individual containers used each day for the packaging of milk in that city are made of paper. These containers are largely being used in schools and in store trade where the single service feature makes a definite appeal to the consumer. One milk plant has been developed

where milk is packaged in paper containers only, 250,000 of these containers being used daily.

Not only the New York City Department of Health, but also the New York State Department of Health and Departments of Health in large cities where these containers are in use are considering revisions of their present milk codes as these have been made to cover the use of glass and metal containers only. New problems are raised by the use of single service, moisture-proof paper packages. The procedure tentatively approved by the American Public Health Association for determining the number of bacteria present in milk bottles was developed for use in rinsing glass containers. It is not well suited to the examination of paper containers inasmuch as these containers normally show fewer bacteria per cc of capacity than do glass bottles as washed in the average milk plant.

Mr. W. D. Tiedeman, Associate Referee for the Standard Methods of Milk Analysis Committee, has therefore recommended that containers yielding low counts be rinsed with 10 cc quantities of sterile rinse water and that the entire amount be divided among three petri plates of the ordinary size and type. The total number of colonies that develops on the three plates gives the count per container. Research carried out at the New York Experiment Station by Dr. J. R. Sanborn, has shown that the paper board out of which these containers are made normally gives counts less than 500 per gram of disintegrated stock. This has led to the suggestion that some bacteriological standard should be established for paper board used for making food containers. Methods whereby public health men can determine that the paper stock is made from clean virgin pulp are also being developed.

This situation led to the preparation of an outline of "Principles of Sanitation that Should Govern the Manufacture and Use of Paper Milk Containers." This outline was made the basis for discussion and criticism at the conference held at Geneva, New York. Representatives of the following manufacturers of paper milk containers were present: American Can Company, American Sealcone Company, Dixie Vortex Company, Mono-Service Company, Ex-Cell-O Corporation, Purity Paper Vessels Company, Reed Container Company, Safety Service Milk Bottle Corporation and the Sealright Co., Inc.; also, manufacturers of paper board used in making these containers, makers of

paper cups, secretaries of interested paper and pulp and container associations, milk dealers using paper containers; and representatives from seven national, state and municipal health groups. Brief impromptu reports on investigations completed or in progress were made by Dr. F. W. Tanner of Urbana, Mr. W. D. Tiedeman of Albany, and Prof. John W. Rice of Bucknell University. Those present entered freely into the discussion of sanitation problems and as a result several improvements were made in the outline as given below.

It was pointed out that this outline was not drawn up in a form that would be satisfactory for use as a municipal ordinance, and it was suggested that the Baltimore City ordinance (Milk Sanitarian, Vol. 6, May 1937, p. 22) deserved study in this connection as it had been drawn up after a careful consideration of the problems involved. This ordinance forbids the use of completely prefabricated containers as it requires the paraffining of the containers in the milk plant. It was reported by Dr. Sanborn that a comparative study of finished containers had shown that some of the prefabricated containers were in a more satisfactory bacteriological condition when examined just as they were to be filled with milk than freshly paraffined containers. From other reports it also became evident that this ordinance places too great reliance on paraffining just before the container is filled as a sterilization procedure. From the time the paper board is made until it is paraffined, it should be handled in as cleanly a manner as possible, even aseptically where this is feasible.

The Baltimore ordinance does not mention the hot melt or thermoplastic types of adhesives which are considered to be even more desirable than the type of adhesive specified as they do not require the use of a chemical preservative to prevent fermentation. It was generally felt that ordinary animal glues ought not to be permitted under any condition. The statement regarding white spruce pulp was criticized by practical paper men as being too specific. So-called white spruce pulp in eastern U. S. A. normally includes some hemlock, balsam and other coniferous woods, while the newer southern yellow pine pulps are also being used to good advantage in making board for food containers. Anything that would tend to make the paper pulp industry independent of imported pulps would seem to be desirable from the public health standpoints as it would

tend to prevent the sudden use of substitutes in case war or other changes should cause interruption of normal channels of trade.

In order to develop further discussion of the sanitation problems involved, the revised statement of principles of sanitation is submitted for publication. These principles are drawn up on the assumption that the use of paper milk containers of both the prefabricated type and the type which is fabricated in the milk plant are to be permitted. It is believed that as manufacturers continue to make progress in methods of manufacture and handling, it will soon be possible to adopt more stringent standards. The paper milk container seems at last to be with us to stay and this seemed to be the judgment not only of the manufacturers, but also of the public health men present at the Geneva conference.

Paper Containers for Milk.

Principles of Sanitation to be Observed in Their Manufacture and Use.*

Item I.

Paper Container Stock.

Containers shall be made from virgin chemical or mechanical pulp. Virgin pulp is pulp that has not previously been used for commercial purposes. Board prior to moisture-proofing shall not at any time have a count exceeding 500 colonies per gram of disintegrated board.**

Unless used immediately after manufacture, container board shall be wrapped, sealed and protected until used. When used, the outside sheet on rolls or the top and bottom sheets of sheeted stock shall be discarded in all cases.

Public Health Reasons.

(a) The use of stock which has previously been used for commercial purposes (secondary stock) is not consistent with standards of food quality. Even if sec-

* As revised at a Conference held at Geneva, N. Y., July 12, 1937. Originally prepared by J. R. Sanborn, M. W. Yale and R. S. Breed.

** Standard given is suggestive only. Before adoption further research and standardization of methods for determining the bacterial count are necessary.

ondary pulp is completely sterilized during recovery, its miscellaneous content of foreign matter
2499 and dirt render it unsuitable for use in milk container stock.

(b) Contamination of rolls of paper, or sheeted stock occurs most readily at ends or the top or bottom sheets, hence the advisability of complete wrapping protection and sealing of these rolls or packs. Discarding the outside sheets of rolls or top and bottom sheets of sheeted stock, is a desirable precaution.

Satisfactory Compliance: For the above reasons, this item shall be deemed to have been satisfied when:

(a) Mills produce container board from virgin pulps.

(b) Mills require personal cleanliness among operators and consistently practice plant sanitation for the purpose of producing board low in dirt count and free from slime spots.

(c) Rolls or sheeted stock are wrapped immediately after manufacture in strong, clean wrappers, or utilized before there is opportunity for contamination from dust, dirt, or handling.

Item 2.

Process of Conversion—Where Stock Is Made Directly Into Containers

When container board reaches conversion plant, it shall be considered that this paper has received a bactericidal treatment. All stock and containers shall be handled mechanically so far as possible. Following fabrication, until final sealing in milk plant, container surfaces with which milk or milk products come in contact shall be protected from contamination. This shall be done through the use of mechanical equipment, careful handling, sealed sanitary shipping cases, or a closure for each container.

Public Health Reasons: Human handling of container board increases opportunity for contamination which is reflected in the numbers and types of microorganisms present in waxed containers. If stock in conversion and milk plants is not protected from contamination, the value of germicidal treatment and sanitary precautions at pulp and paper mills will be partly or entirely nullified. Moisture-proof treatment may not completely sterilize containers.

The chief purpose of the latter treatment is to render containers uniformly non-absorbent. Fortunately the same process may act as a secondary line of defense against contamination with microorganisms.

Satisfactory Compliance: This item shall be deemed to have been satisfied when:

(a) Paper direct from pulp and paper mill is unwrapped in conversion plant close to mechanically-fed machine and sheets exposed to unavoidable manual contact are discarded.

(b) Entire conversion process, methods of packing and shipping are conducted in such manner as to protect container from contamination, particularly human contact contamination.

Item 3.

Process of Conversion Where Container Is Preformed in a Collapsed or Nested State Before Final Sealing: Throughout the processes of printing, folding, sealing, adhesive application, or packing prior to shipment to milk plant, all stock and containers shall, as far as feasible, be handled mechanically and be suitably wrapped or packaged before shipping.

Packaged container stock at milk plant shall be kept in a clean, dry place and opened only for immediate use. Where it is necessary to form or manipulate containers, all surfaces with which milk or milk products may come in contact, shall be protected from human handling.

Public Health Reasons: It is important that, during intermediate stages in conversion processes, manual contacts with container board be reduced to a minimum. In order to guard against promiscuous handling and exposure to dirt, it is advisable to keep board not in actual use, packaged and sealed. Fabrication, printing and sealing of containers should be conducted in such manner as to protect them from contamination.

Satisfactory Compliance: This item shall be deemed to have been satisfied when:

(a) Plants for printing, folding, sealing, and packing containers or other operations prior to delivery to milk plants, handle container board mechanically so far as possible and, at the conclusion of the operations, package the stock in suitable wrappers, cartons, or tubes.

(b) Milk plants protect packaged containers and contents from injury or abuse and complete fabrication, filling, and sealing of containers in such manner as to protect them from contamination.

Item 4.

Moisture-Proofing: Moisture-proofing of containers shall be accomplished by means of fully refined paraffin wax or other suitable materials which are odorless, tasteless and non-toxic. The operation of paraffining machines shall be supervised by competent mechanics.

Public Health Reasons: Fully refined paraffin is the only grade acceptable to and consistent with food uses. It is of fundamental importance that containers be rendered completely non-absorbent by machines that operate properly and that the moisture-proofing material be odorless, tasteless and non-poisonous.

Satisfactory Compliance: This item shall be deemed to have been satisfied if the purpose and quality of the treatments described above are strictly maintained.

Item 5.

Adhesives: The gluing or sealing of container board shall be accomplished by means of non-fermentable adhesives, including synthetic, thermoplastic varieties, or such types having cereal or casein bases as produce rapidly-drying films which resist decomposition, dissolution, and leaching. Adhesives must not contaminate containers with microorganisms.

Public Health Reasons: Adhesives are as a class notoriously susceptible to decomposition by microorganisms. Some of these highly perishable materials, such as animal glue, are obviously not suitable for use in food containers. A number of adhesives, represented by products employing cereal or casein bases, while ordinarily fermentable, may be produced in forms or grades which are non-odorous, resistant to moisture, and unsuitable for the development of microorganisms.

Satisfactory Compliance: In accord with the above account, this item shall be deemed to have been satisfied if:

(a) Rapidly drying adhesives having cereal or casein bases which resist fermentation are used to form liquid-

tight joints; these adhesives do not contaminate containers with microorganisms.

(b) Adhesives employed be of hot melt or thermoplastic types.

Item 6.

Germicides: Germicidal and bacteriostatic agents that are toxic to human beings or that affect milk in any way, as in taste, odor or nutritional qualities shall not be used in board, adhesives, or moisture-proofing materials for milk containers.

Public Health Reasons: Substances introduced into materials of which containers are composed, which might conceivably exert preservative or antiseptic effects may affect the nutritional value of milk and be instrumental in producing off-flavors or odors. In some cases injurious effects on human beings from the use of such antiseptics have been demonstrated. It is necessary that substances of this class for use with containers be free of any toxic associations.

Satisfactory Compliance: This item shall be deemed to have been satisfied when:

(a) No germicidal or bacteriostatic agents are used unless they have been shown to be non-toxic and without effect on milk through the use of physical, chemical and biological tests, supported by clinical evidence.

Item 7.

Handling of Paraffin: Paraffin in the solid state shall be shipped and stored in cool, clean, dry places, protected from dirt and isolated from odorous materials. Paraffin in the liquid state shall be kept, at all times, in clean and sanitary containers. Waxing machines and baths shall be cleaned at regular intervals unless cleaning devices such as continuous filtration, are employed. In no case shall freshly prepared, new paraffin be introduced into used paraffin which has become discolored, oxidized or dirty. Odorous substances such as ordinary kerosene and gasoline shall not be used on or about conversion machines.

Public Health Reasons: Paraffin absorbs odors and for the sake of milk quality it is advisable that special storage facilities be provided, which will also protect wax from promiscuous handling and exposure to dirt.

Due to the susceptibility of heated paraffin to oxidation, a well-regulated program of paraffin utilization should be followed to avoid over-heating, prevent contamination of new paraffin with partly oxidized wax and to eliminate the possibility of coating or impregnation of containers with discolored, dirty or oxidized wax.

Satisfactory Compliance: This item shall be deemed to have been satisfied if:

2500 (a) Slabs of paraffin are shipped and stored in clean, cool, dry places and removed from storage only as required for coating or impregnation bath.

(b) Paraffin for coating, impregnation or storage is held at temperatures and for period of time which will not impart flavors or odors to paraffin or milk.

(c) Molten paraffin is held in clean sanitary containers.

(d) Paraffin bath or tank is cleaned by continuous filtration or at regular intervals depending on such evidences of deterioration as discoloration and presence of dirt or fiber.

(e) The possibility of mixing new paraffin with a product that is unfit for use is avoided.

Item 8

Shipping Cases And Storage For Pre-made Containers: Cases for shipping empty containers shall be constructed of container board or wrapping designed to adequately protect containers from injury or abuse due to tearing or breaking. Containers shall be stored in sealed, dry, unbroken cases, in a dry place.

Public Health Reasons: Damage to shipping cases frequently exposes containers to conditions which may result in serious contamination from dirt, wetting and human contact.

Satisfactory Compliance: This item shall be deemed to have been satisfied when:

(a) Shipping cases are well enough constructed and sealed to resist the handling they receive in transit without injury.

(b) Containers are stored at all time in sealed cases in places having dry floors and where there is no washing down of the floors while cartons are in storage.

Item 9

Cartons For Shipping Filled Containers: Only clean cartons shall be used for shipping filled containers. Returned carriers shall be handled or stored so as not to become wet, dirty, or damaged before again being used.

Public Health Reasons: The re-use of shipping cartons may easily become a menace to milk quality and health. The abuse of these boxes arises from lack of care in handling and storing returned cartons. They may be carelessly thrown aside, allowed to become wet, dirty and mildewed. The packing of new containers of fresh milk in abused cartons is a practice which should not be allowed as it may cause addition of organisms and dirt.

Satisfactory Compliance: This item shall be deemed to have been satisfied when:

(a) New paper cartons are used for single delivery to retailer.

(b) Milk plant has adequate and dry storage facilities for returned cartons and uses only neat and clean, uninjured boxes.

Item 10

Examination Of Containers: Bacterial plate counts shall be made in conformity with the latest standard methods recommended by the American Public Health Association.

Public Health Reasons: Consideration of possible sources of contamination during container manufacture, renders it advisable to reduce to a minimum the number of organisms present. While the likelihood of contamination by disease organisms is slight, bacteriological control of plant sanitation is necessary.

Satisfactory Compliance: This item shall be deemed to have been satisfied when:

(a) Quart containers develop not more than 1,000 colonies, pint containers develop not more than 500 colonies and half-pint containers develop not more than 250 colonies as determined by the Standard Methods of the American Public Health Association.*

---

* Sanitary conditions in pulp and paper mills, container manufacturing plants and dairies usually enable paper containers to meet a standard of less than 100 colonies per container. Standards given are suggestive only. They are in accord with the standards suggested by the American Public Health Association for glass bottles. Standard Methods of Milk Analyses, 7th Ed., 1938.

Item 11

Quarantined Residences: The delivery of milk or milk products to and the collection of milk or milk-products containers from quarantined residences shall be subject to the special requirements of the health officer. It is recommended and urged that single service containers be used for retail delivery of milk and milk products under these circumstances. In case of wholesale delivery, to hospitals, etc., caring for infectious diseases carrier cartons as well as individual containers should be destroyed.

2501 I. Microbiologic flora in cardboard used for containers:

Sanborn letter of November 24, 1937.

Average of 35 viable spores per gram of finished cardboard.

2502 (Letterhead of New York State Agricultural Experiment Station Geneva, N. Y.)

November 24, 1937.

Mr. George D. Scott
The Ex-Cell-O Corporation
1200 Oakman Boulevard —Confidential—
Detroit, Michigan.

Dear Mr. Scott:

In accord with your request, we herewith submit the following progress report on certain aspects of our pulp and paper mill investigation.

The following table presents incomplete results from the two best mills out of eight that we have examined. It represents, therefore, only a very limited survey. These counts were obtained on standard agar at 32° for 3 days.

Bacteriological Studies of Container Board

Samples	Colonies Per Gram	Samples	Colonies Per Gram	Samples	Colonies Per Gram
Cherry River Ex-Cell-O Board				Cherry River Container Board C.

Test 11	54	Test 21	11
Test 12	54	Test 22	6*
*=Results from another laboratory		Test 23	0*

These results are representative of the counts obtained from board samples that were actually a part of the investigation. Our results, viewed as a whole, show wide variations, evidently due to inconsistencies in microbiological control. Seasonal variations in water supplies, temperatures, slime formation, local differences in mill practices and procedures undoubtedly account for lack of consistency in counts on disintegrated board. We hope that as a result of our investigations, pulp and paper mills will be able to achieve greater uniformity in the finished board. Our work with the Cherry River mill along these lines has just started. The results of the tests on samples collected at the mill on November 17th are as follows:

Sample	Colonies per cc. 32°/72 hours
Raw water	3,000
Chlorinated, filtered water	3
Vat 1—Sulfite pulp in filtered water	8,680
Vat 2—not in use	—
Vat 3—Sulfite pulp in filtered water	7,688
Vat 4—Sulfite pulp in filtered water	8,122
Vat 5—Sulfite pulp in filtered water	8,590

While drier temperatures reduce the vat counts to figures such as those below for finished board, it is possible to make considerable reductions in vat counts, resulting in more uniformly low count boards. We are working with Cherry River toward this objective. The following results which were also reported above, are the findings obtained from samples of board taken at the mill on November 17th. Results of tests on two samples are incomplete.

Samples	Colonies Per Gram	Samples	Colonies Per Gram
A Test 1	0	E Test 1	0
Test 2	73	Test 2	7
B Test 1	108	F Test 1	77
		Test 2	22
C Test 1	21	G	Not complete
Test 2	11		
D Test 1	32	H	Not complete
Test 2	43		

2504

We trust that this preliminary report will be helpful to Dr. Arnold. It will be possible later to present a much more complete account.

With best regards, I am

Very truly yours
J. R. Sanborn

2508 October 23, 1937

Dr. Robert S. Breed
New York State Agricultural Experiment Station
Geneva, New York

Dear Dr. Breed:

Immediately upon learning from you of the Dowicide A preservative, we communicated with the Arabol Manufacturing Company and asked them to substitute it for their present preservative. We also mailed them a copy of the proposed standards as written up in Geneva. A copy of their reply is attached hereto. We were very pleased to learn that Dowicide A is already being used in our adhesives that are manufactured by them.

We would very much like to have a letter from you, confirming the conversation in New York in which you stated that Dowicide A, in your opinion, is a satisfactory preservative.

Our other adhesive supplier, the National Adhesives Corporation, is using benzoic acid for a preservative. A copy of a description of benzoic acid, from Merck's Manual of Materia Medica, Volume V, is enclosed herewith. You will note that the average dose of this drug is 8 gr. The Detroit Testing Laboratory (recommended to us by the U. S. Bureau of Standards) analyzed this glue for us and reported a total of 5% preservative in it, or 210 gr. per pound of glue. As one pound of our adhesive will glue approximately 1500 containers, the benzoic acid per container will amount to 14/100 of a grain. This is spread over fifteen square inches of paper, and, under the very worst conditions, only a minute fraction of this surface would ever be exposed to milk. We believe this information will be of interest to you.

We are still very anxious to have Dr. Sanborn with us, and hope he will give us a few days notice so that either Mr. Bixby or myself can arrange to be here to show him about.

Very truly yours,

R. E. Krengel,
Pure-Pak Division.

REKrengel:L

2509 F. I. D. 104 Issued March 3, 1909

UNITED STATES DEPARTMENT OF AGRICULTURE

Office of the Secretary

Board of Food and Drug Inspection

Food Inspection Decision 104

Amendment to Food Inspection Decisions No. 76 and No. 89, Relating to the Use in Foods of Benzoate of Soda

The Referee Board of Consulting Scientific Experts, composed of Dr. Ira Remsen, Dr. Russell H. Chittenden, Dr. John H. Long, Dr. Alonzo E. Taylor, and Dr. C. A. Herter, have reported upon the use of benzoate of soda in foods. The Board reports, as a result of three extensive and exhaustive investigations, that benzoate of soda mixed with food is not deleterious or poisonous and is not injurious to health. The summary of the report of the Referee Board is published herewith.

It having been determined that benzoate of soda mixed with food is not deleterious or poisonous and is not injurious to health, no objection will be raised under the Food and Drugs Act to the use in food of benzoate of soda, provided that each container or package of such food is plainly labeled to show the presence and amount of benzoate of soda.

Food Inspection Divisions 76 and 89 are amended accordingly.

George B. Cortelyou,
Secretary of the Treasury.
James Wilson,
Secretary of Agriculture.
Oscar S. Straus,
Secretary of Commerce and Labor.

The Influence of Sodium Benzoate on the Nutrition and Health of Man

Of the questions referred to this Board[1] the first to engage our attention have been the following:

(1) "Does a food to which there has been added benzoic acid, or any of its salts, contain any added poisonous or other added deleterious ingredient which may render the said food injurious to health? (a) In large quantities? (b) In small quantities?"

(2) "If benzoic acid or any of its salts be mixed or packed with a food, is the quality or strength of said food thereby reduced, lowered, or injuriously affected? (a) In large quantities? (b) In small quantities?"

To obtain satisfactory answers to these questions the Board has felt it necessary to carry through a careful investigation of the effect of benzoic acid or some one of its salts on the nutrition and general health of man. A thorough study of the literature giving the results of work done by various investigators on the physiological effects of benzoic acid and its salts, together with a study of reported clinical and medical observations; therapeutic usage, etc., have made it apparent that additional work was needed to render possible a conclusive answer to the above questions.

With a view to limiting the scope of the work, while at the same time meeting all practical requirements, our investigation, with the consent of the Secretary of Agriculture, has been confined to a study of the effect of the sodium salt of benzoic acid, viz, sodium benzoate.

To make this experimental inquiry as thorough as possible, and to minimize the personal equation, three independent investigations have been carried out—one at the medical school of Northwestern University, in Chicago, under the charge of Prof. John H. Long, of that institution; a second at the private laboratory of Prof. Christian A. Herter, of Columbia University, New York City; and the third at the Sheffield Scientific School of Yale University, in charge of Prof. Russell H. Chittenden.

The same general plan of procedure was followed in all three experiments. A certain number of healthy young

1. Dr. Alonzo E. Taylor, professor in the University of California, a member of this Board, owing to absence in Europe, has not been able to participate in the investigations embodied in this report.

men were selected as subjects, and during a period of 4 months these men, under definite conditions of diet, etc., with and without sodium benzoate, were subjected to thorough clinical and medical observation, while the daily food and the excretions were carefully analyzed and otherwise studied, and comparison made of the clinical, chemical, bacteriological, and other data collected. (For details, see the individual reports.) In this manner material has been brought together which makes possible conclusions regarding the effect of small and large doses of sodium benzoate upon the human system.

In fixing upon the amount of sodium benzoate that should constitute a "small dose", we have adopted 0.3 gram of the salt per day. Manufacturers of food products, which in their view require the use of a preservative, are in general content with 0.1 per cent of sodium benzoate. This would mean that in the eating of such a preserved food the consumer would need to take 300 grams per day, or nearly two-thirds of a pound of preserved food to ingest an amount of benzoate equal to our minimal daily dosage. Looked at from this point of view, our dosage of 0.3 gram per day seemed a fair amount for a "small dose", one that would clearly suffice to show any effect that small doses of the salt might exert, especially if continued for a considerable length of time. In all these four experiments this daily dosage was continued for a period of about 2 months. Under "large dose" was included quantities of sodium benzoate ranging from 0.6 gram to 4 grams per day. Such a daily dosage was continued for a period of 1 month. In a few instances somewhat larger doses were employed.

As the amount and character of the daily diet exert a well-known influence upon many of the metabolic or nutritive changes of the body, as well as upon the bacterial flora of the intestines, attention is called to the fact
2510 that the three investigations differed from each other in the amount of protein food consumed daily, thereby introducing a distinctive feature which tends to broaden the conditions under which the experiments were conducted.

The conclusions reached as a result of the individual investigations are given at length in the separate reports herewith presented, together with all of the data upon which these conclusions are based.

The fact should be emphasized that the results obtained

from the three separate investigations are in close agreement in all essential features.

The main general conclusions reached by the Referee Board are as follows:

First.—Sodium benzoate in small doses (under 0.5 gram per day) mixed with the food is without deleterious or poisonous action and is not injurious to health.

Second.—Sodium benzoate in large doses (up to 4 grams per day) mixed with the food has not been found to exert any deleterious effect on the general health, nor to act as a poison in the general acceptation of the term. In some directions there were slight modifications in certain physiological processes, the exact significance of which modifications is not known.

Third.—The admixture of sodium benzoate with food in small or large doses has not been found to injuriously affect or impair the quality or nutritive value of such food.

Ira Remsen,
Chairman,
Russell H. Chittenden,
John H. Long,
Christian A. Herter,
Referee Board of Consulting Scientific Experts.

2511 (Letterhead of The Arabol Manufacturing Co., New York City)

October 21, 1937.

Ex-Cell-O Corporation,
Detroit, Michigan.

Gentlemen:

Replying to your letter of October 21st re Pure-Pak Adhesive.

We thank you for the report on Paper Milk Containers which we have found very interesting.

In regard to the preservative for adhesives, we have used Dowicide A for some time in the Pure-Pak Adhesive which we supply from Chicago. We carry this number on stock at all times, and we could supply you with any amount of this you want on short notice.

In regard to the Pure-Pak Adhesive shipped from our New York Factory, we believe they use Dowicide A as a

preservative. However, to be sure, we are writing them today to obtain this information and will relay it on to you as soon as we hear from them.

Thanking you for calling this matter to our attention, we remain

Very truly yours,
The Arabol Mfg. Co.,
Per R. Bielen.

2512 (Letterhead of National Adhesives Corporation, Chicago, Ill.)

March 17, 1936.

Mr. Richard Krengel,
Ex-Cell-O Aircraft & Tool Co.,
Martin & Wilmette,
Detroit, Mich.

Dear Sir.

In accordance with the request of our Detroit representative, Mr. H. F. Tiffen, we are pleased to give you analysis of the Mikah Special Carton Adhesive, which we have been furnishing you:

Base is first quality pure food tapioca flour.
Contains 3% Sodium Nitrate.
Preservative is Benzoic Acid.

There are no other ingredients in this product, except, of course, water.

Trusting that this is the information you require, we are

Very respectfully yours,
National Adhesives Corporation,
M. E. Stern.
M. E. Stern.

MES:EC

2513 The Detroit Testing Laboratory
Detroit, Michigan

Number 3106-A-3

Date 7-8-37

Sample from Ex-Cell-O Aircraft & Tool Corporation
Sample of Paste Customer's Order
Remarks Submitted by Client D. T. L. Order 86267

Analysis.

Moisture	68.00%
Starch	29.69%
Sodium Nitrate	2.31%
Reaction faintly acid.	
Preservative	Sodium Benzoate—trace

The starch used is tapioca starch. The sodium nitrate as assayed is a little low. It is difficult, however, to obtain all of the sodium nitrate in a mixture of this kind as it can not be completely separated from the starch paste. It is probable, however, that at least 3% is present.

The Detroit Testing Laboratory,
By C. E. Greenlaw.

2514 IV. Compression tests made by the University of Detroit, November 26, 1937 shows the stability of the Pure-Pak container.

2515

University of Detroit
McNichols Road at Livernois
Detroit, Michigan

College of Engineering

Nov. 26, 1937.

The Excello Corporation,
1200 Oakman Blvd.,
Detroit, Michigan.

Dear Sirs:

I wish to report the following results of tests on milk containers supplied by your organization for compression tests on your order GA 16828, and our test order EM 106:

Detroit Sulphite containers:	Load at which container collapsed:
Quarts, on end, empty, Max. 200, Min. 150 Average	166 lbs.
Quarts, on end, filled, Max. 200, Min. 150 Average	166 lbs.
Quarts, on side, empty, top seam vertical	400 lbs.
Quarts, on side, empty, top seam horizontal	250 lbs.
Stevens and Thompson containers:	
Quarts, on end, empty, Max. 150, Min. 130—Average	137
Quarts, on end, filled, Max. 150, Min. 140—Average	145
Pints, on end, empty Max. 160, Min. 130—Average	142
Pints, on end, filled	100
Half pints, on end, empty	100
Quarts, on side, empty, top seam vertical	375

The above tests were carried out on our 100,000 lb. Olsen Testing Machine, and are accurate with five percent. Where average values are given, five tests were made. Where averages are not given results were the same for all specimens tested, in each case not less than five.

2518 V. Durability of container filled with milk and kept at 100° F., report of Huffman, December 4, 1936.

2519 Durability Heat Tests—Pure-Pak Containers.

The object of this test was to determine if filled Pure-Pak containers when subjected to high temperatures for a given period would still be satisfactory receptacles for dairy products.

In dairy operation and distribution containers filled with dairy products are not permitted to reach a temperature over 50° F. Examination of filled containers held at this temperature in the dairy chill rooms and in the ice chests of the groceries proves that the Pure-Pak container remains in excellent condition for any practical period of time.

However, in order to leave no doubt as to the durability of the containers, quart packages filled with milk were placed in a specially constructed oven in which the temperature had been brought to and was controlled at 100° F.

At the end of 12 hours the containers were examined very closely for leaks or penetration of the milk. They were found to be in excellent condition, although the milk was by that time rancid.

Inspections were made at 12-hour intervals for the next 60 hours and at the end of this time the containers were still in very good condition; although they were somewhat deformed from their original square shape, no leaks had developed at any of the glue seals and the contents were still intact.

We feel that a test of this nature proves conclusively that for all practical purposes the Pure-Pak container has a wide margin of durability.

G. S. Hoffman,
Research Engineer Ex-Cell-O Corporation Pure-Pak Division.

Certain Sanitary Aspects of the Use of Paper Milk Containers.

M. J. Prucha,
Department of Animal Husbandry,
University of Illinois,
Urbana.

2525 Certain Sanitary Aspects of the Use of Paper Milk Containers.

M. J. Prucha,
Department of Animal Husbandry,
University of Illinois,
Urbana, Illinois.

The bottling of fluid milk in paper containers is not a new idea. In a book by Kenelm Winslow entitled "Production and Handling of Clean Milk," published in 1909, the following statement appears on page 140. "The latest departure in the way of a milk bottle is the single service milk container of pulp wood invented and made by G. W. Maxwell of 1201 Falsom Street, San Francisco, California. It is now in actual use by dairymen in Los Angeles, California."

While the paper milk container was invented some thirty years ago, very little attention was paid to it by the fluid milk industry or by the milk sanitarians. It is only within the last few years that the paper milk container has forced its way into the fluid milk industry and to the attention of the milk sanitarians.

The paper milk container brings with it new problems, economic, practical, and sanitary.

As a result of demand for information concerning the paper milk container, a study on the subject was undertaken by the Dairy Department, University of Illinois. This paper is a progress report on some sanitary problems connected with the use of paper containers for fluid milk.

There are on the market, at present, at least five different types of paper milk containers. The study reported here was carried on specially with the Pure-Pak milk container. In the case of this container, the paper

(after it is made in the paper mill) is packed in large bundles and is shipped to the carton manufacturing company. Here the container is cut out, printed, and sealed along its long edge. It is packed and shipped to the dairy plant in a collapsed condition. In the milk plant the containers are fed into the Pure-Pake machine, made by the Ex-Cell-O Corporation of Detroit, Michigan. The container enters the machine at one end in its collapsed condition and comes out at the other end filled with milk and sealed. As it passes through the machine the container is first formed, then its bottom is sealed, then it is dipped in hot paraffine, passed through a cooling chamber, filled with milk, and finally it is sealed and dated.

What are some of the sanitary problems connected with the paper container? First, let us visit the paper mill. A paper mill requires a large volume of water so every paper mill is located by some abundant body of water—it may be lake, river or well. The paper from which the containers used in this study were made, came from the Detroit Sulphite Pulp and Paper Company. The pulp was made from red spruce trees by the Sulphite-
2526 lime process. As the tree logs enter the paper mill they are washed and cleaned of all bark. As they pass from the washing machine to the cutter they are sorted, as only sound and free-from-bark-and-knots logs are acceptable. Next the logs enter the cutter where they are cut up in $\frac{1}{8}$ inch log chips. The chips of wood are sorted as they pass on their way to the cooker. The cooker is a large steel cylinder lined with brick. Here the wood chips are cooked for about 20 hours in a sulphur-lime solution under steam pressure at a temperature of 250° F. or higher.

Bacteriological examination of the wood pulp as it came out of the digesting retorts, or cylinders, showed it to be sterile. This is to be expected because no microorganism could survive such cooking as is given the wood.

The next step in the handling of the pulp is the washing to remove all traces of the sulphur-lime solution. For this purpose copious amounts of water are necessary. While the water was filtered and chlorinated, it was not free from bacteria. The equipment also tends to contaminate the pulp so that by the time it is washed it contains a bacterial count varying from a few hundred to several thousand per ml. of the water and pulp mixture.

The washed pulp is then conveyed to the bleaching vats. Here it is mixed with a hypochlorite to give an initial active chlorine content of 10,000 parts of chlorine to a million parts of pulp and water mixture. After several hours of exposure, the pulp again becomes sterile. Next the pulp is washed to rid it of chlorine solution. Just before it enters the paper mill proper, the size composed of partially saponified rosin and paper makers' alum is added. The size as a rule is not sterile. It ranged in bacterial count from 200,000 to about 12 million per ml. The amount of size added in proportion to the volume of pulp and water mixture is so small that numerically the bacterial count of the pulp is increased but little. Also the residue of chlorine in the pulp following the bleaching appears to exert some germicidal influence on the bacteria in the pulp at this stage. In one examination the water used for diluting the pulp had a bacterial count of 1500 per ml., the count of the size was 2,000,000 per ml., but the mixture of pulp, size and water had a count of only 400 bacteria per ml. By the time the pulp reached the paper mill rollers, its count was only 40 bacteria per ml.

In the paper mill proper the pulp is picked up from the water suspension by revolving cylinders covered with fine mesh wire cloth. The layers of the pulp adhering to the cylinder become the paper. In order to drive the moisture from the layers of the pulp, it is passed over large steel revolving cylinders which are heated by steam at a pressure of about 15 pounds. By the time the layer of pulp passes over about 35 hot cylinders it becomes dry, the water being evaporated or rather boiled off, during the process.

Bacteriological examination of the finished paper was made as follows: Strips of paper four inches square were cut off as the paper was leaving the last hot cylinder. The paper strips were placed in 100 ml. of sterile water and after vigorous shaking, plates containing one ml. of the water were poured. In most cases the plates developed no colonies. The paper so made is practically sterile when it comes off the hot rollers.

2527 The paper destined for milk containers was cut automatically as it came off the steam rollers, packed in large bundles and was shipped to the carton company, in this case to the Chicago Carton Co. Here the containers

were designed, cut, printed, and sealed along the long edge. They were packed in large cartons and were shipped to the milk plant, where they were paraffined and filled with milk.

At this point the unparaffined containers were examined for bacteria. In one test twenty-quart size containers were torn up into large pieces and were jammed by disinfected hands into a three-gallon milk can containing six liters of sterile water. After soaking for twenty minutes and vigorous shaking, one ml. of the water was plated in each petri dish. Several of the plates had no colonies and the rest had only one or two colonies. Calculations from such counts gave 2.3 bacteria per square inch of the surface of the paper.

Another examination of the containers was made to determine how many bacteria were enmeshed in the body of the paper. One quart size container was broken up in pieces and placed in a glass butter churn in 1500 ml. of sterile water. The churn was agitated until the paper was reduced to pulp, which took about forty minutes. Ten plates were made in each test, each plate contained one ml. of the pulp suspension. The results from one test in which five containers were examined are given in Table 1. Calculations based on the counts obtained show that in container 1 the paper had 50 bacteria per grain. In container 5 the paper had 18 bacteria per grain. The results indicate that the number of bacteria enmeshed in paper made by the above-described process was too small to be accurately estimated by the available bacteriological methods.

The next step in this study was the bacteriological examination of the containers after they were paraffined. The containers were passed through the Pure-Pak machine where they were paraffined at 170° F., and the empty containers were sealed. The containers were selected for this study in the following manner: Each day during six weeks, the first six containers that passed through the machine before bottling of the milk and also the last six after the milk was bottled were taken for the examination.

Table 1.—Number of Bacteria Enmeshed in the Paper From Which Milk Containers Were Made.

Container number	No. of colonies on each of ten plates. One container in 1500 ml. water. One ml. in each plate										No. of bacteria per gram of paper
	Plate number										
	1	2	3	4	5	6	7	8	9	10	
1	1	3	2	3	0	1	1	2	1	0	50
2	1	2	0	0	2	1	2	0	0	0	28
3	1	0	0	0	2	1	0	1	1	1	25
4	1	2	0	1	0	0	1	2	4	0	39
5	0	0	1	0	1	0	0	1	2	0	18

2528 The method used was that recommended by the Standard Methods. The containers were opened in the laboratory, 100 ml. of sterile water added. After a thorough shaking, two plates—using one ml. of the water in each—were poured. The trypton glucose agar was used for plating.

Of the 266 containers examined; 52 gave no colonies on the duplicate plates; 65 gave one colony on one of the duplicate plates and no colony on the other plate; 48 gave one colony on each plate; 20 had two colonies on each plate and only one container had more than 10 colonies on the duplicate plates.

Two conclusions can be drawn from these results—first, the number of bacteria in these containers was extremely small; second, this method (adding 100 ml. of sterile water to the container and, after shaking, making duplicate plates containing 1 ml. of the water) is not sufficiently accurate for determining bacteria in the containers.

In subsequent examinations of the containers, the following method was used—about 25 to 30 ml. of the nutrient agar was poured directly into the container. After sufficient agitation to bring the agar in contact with all the inside surface, the containers were incubated. In order to count the bacterial colonies, the containers were cut open, the slab of agar was placed on the counting glass and the colonies were counted.

Using this method for determining the number of bacteria in the empty containers, the following results were obtained: One hundred and ten containers paraffined at 170° F. and plated within four hours after paraffining, developed

110 colonies, which is less than one colony per container; ninety-three containers paraffined at 180° F. developed 49 colonies; ninety-eight containers paraffined at 185° F. developed 29 colonies; and ninety-five containers paraffined at 190° F. developed 53 colonies. A large percentage of the containers developed no colony and the largest number of colonies found in any container was only five.

The conclusion drawn from the results of these examinations is that when the pulp is prepared by the sulphite process and is bleached and made directly into paper, the paper made from it is practically sterile; and after the containers are paraffined, they are practically sterile. It did not seem to make much difference whether they were paraffined at 170° F., 180° F. or 190° F.

The examination of paraffined containers was extended to other makes of containers. So far 1055 of these have been examined. Forty-five percent of these developed no colonies. The largest count obtained was 309 colonies. A point of interest in this examination was the observation that some of the containers appeared to have paper defects manifesting themselves in the form of brownish patches in the paper under the paraffine coating. The containers with these defects were apt to have high bacterial counts as shown in Table 2. The twelve containers in this table are those giving the twelve highest counts of the 1055 examined. Also, it is to be noted that nine of them had defects and all of them harbored spore-producing bacteria.

2529 Table 2.—Twelve Containers Among 1055 Examined Giving the Highest Bacterial Counts.

Number	Total count	Spreader	Defects in paper
1	309	+	+
2	150	+	—

+ Bacteria survived. — Bacteria killed.

In general, the examination of over two thousand paraffined paper milk containers showed that about 50 per cent of them developed no colonies. The remaining 50 per cent of the containers developed only a small number of colonies. From the numerical standpoint, the number of bacteria in them was far below the standards suggested for milk bottles.

Another phase of the study dealt with the paraffining of the containers. The paraffining of the containers is done primarily for the purpose of making the paper impervious to the milk. Since paraffining must be done at relatively high temperatures, the process also involves a bactericidal action.

This phase of the study has been conducted both in the milk plant and in the laboratory. In the milk plant the Pure-Pak machine was used for paraffining the containers. The machine is operated so that the containers are exposed to the hot paraffine and the hot air in the paraffine well for thirty seconds. The temperature of the paraffine can be set as desired.

To test the bactericidal property of the paraffining process, the containers were impregnated with a bacterial suspension of a given organism. For this study a variety of B. prodigiosus was used. In the first part of the study the containers were inoculated by being dipped in a bacterial suspension which had a plate count of 200,000,000 to 300,000,000 bacteria per ml.

In dipping the containers, they absorbed on the average about seven ml. of the suspension; thus there was deposited on each container approximately one and one half billion of the bacteria.

As soon as the containers were dry they were paraffined and sealed by the machine. To test for the presence of B. prodigiosus about 25 ml. of nutrient agar were poured in each container and after a thorough shaking, the containers with the agar were incubated at room temperature for at least four days.

2530 As already stated, the speed of the machine is adjusted so that each container was exposed to the hot air in the paraffine compartment and to the paraffine for 30 seconds. The two factors that could be varied were the temperature of the paraffine and the number of bacteria put on the surfaces of the container.

The following results were obtained when the containers were inoculated by dipping them in a bacterial suspension

containing large numbers of bacteria, say 200,000,000 to 400,000,000 per ml. Most of the containers after they were paraffined were free from bacteria, but there were a few—one to ten per cent—in which the bacteria survived. This was true when the temperatures were 170° F., 180° F., and even at 190° F. Once in a while a container would show the presence of bacteria.

When the bacterial suspension was such that there would be less than 2,000,000 bacteria per ml., the containers dipped in it and paraffined did not develop any B. prodigiosus colonies.

The method of inoculating the containers by dipping them in bacterial suspension was discontinued. Instead, the containers were inoculated by rubbing the inside surface of the containers with a hand dipped in a heavy bacterial suspension. This method deposited about 5,000 bacteria in each container. In one of the runs, using this method of inoculation, 300 containers were inoculated using a suspension of 250,000,000 bacteria. Another lot of 300 containers was inoculated using a suspension of 2,000,000 bacteria. One hundred of the heavily inoculated and one hundred of the lightly inoculated containers were paraffined at the following temperatures: 160° F., 170° F., and 180° F.

The 300 containers inoculated with the suspension containing only 2,000,000 bacteria per ml. and paraffined at 160° F., 170° F., and 180° F. were all negative.

When the containers were inoculated by rubbing with hands dipped in suspension that contained 250,000,000 bacteria per ml. there were nine positive out of 100 paraffined at 170° F., one was positive out of the 100 paraffined at 180° F., and two were positive out of the 100 paraffined at 190° F.

Still another method of inoculating the containers was tried. In regular dairy operations, the dairy plant operator, using his hands, takes the containers from the shipping carton and places them in a rack on the machine. This is the only place where the containers are handled by hand. To inoculate the containers the operator dipped his hands in a bacterial suspension before handling the containers. The bacterial suspension had about 300,000,000 bacteria per ml. The exact number of bacteria deposited on each container by such handling was not determined, but the containers were examined for the presence of bacteria.

In one test, six hundred containers were inoculated in this manner and were paraffined. Two hundred were

treated at each of the following temperatures: 170° F., 180° F., and 190° F. The examination showed all the containers paraffined at 170° and at 180° F. to be free from B. prodigiosus. Of the two hundred paraffined at 190° F., 199 were negative and one positive.

2531 In these tests in which inoculated containers were paraffined by the machine, a number of uninoculated containers were always passed through the machine before and after the inoculating containers. In no case were the uninoculated containers positive, indicating that the hot paraffine and the machine parts with which the uninoculated containers came in contact were free from B. prodigiosus.

The study of paraffining the paper was also carried on in the laboratory. Here small strips of paper, ½ by 2½ inches, were used. The strips of paper were dipped in a bacterial suspension and dried. They were then paraffined at different temperatures for varying lengths of time.

In Table 3 are presented results from one of the runs. Six strips of paper were treated for each combination of time and temperature. B. prodigiosus suspension of 200,000,000 bacteria per ml. was used in this test. The bacteria were killed in twenty seconds at 212° F.; in thirty seconds at 200° F. and 190° F.; in forty-five seconds at 180° F. and at 170° F. They were not killed in one minute at 160° F.

Table 3.—Killing of B. Prodigiosus by Paraffining One-Half Inch by Two and One-Half Inch Strips of Paper Inoculated with 1,000,000 Bacteria.

Temperature of paraffine	Seconds exposed				
	10	20	30	45	60

\+ Bacteria survived.
— Bacteria killed.

In Table 4 are given results obtained in one test in which the strips of paper inoculated with coliform organism were dipped in sterile hot water instead of in paraffine. It will be noticed that the hot water was very much more effective than paraffine in killing bacteria. This organism had approximately the same thermal death point as B. prodigiosus.

As the paper milk bottle travels from tree logs to a container filled with milk, there are several points in the journey at which sanitary control should be practiced. The goal in paper mills should be to produce sterile or nearly sterile paper. In the first place, the water used in the paper mill should be so treated that it is safe to drink. Such water should be low in bacterial counts, purified and chlorinated. When sulphite process pulp is used and is bleached, and when the water is as stated above, the paper will be practically free from bacteria.

2532 Table 4.—Killing B. Coli on Paper by Dipping Strips of Inoculated Paper in Hot Water. Each Strip Inoculated with 5,000,000 Bacteria.

150° F.	— —	— —	— —	— —	— —

+ Bacteria survived.
— Bacteria killed.

The next sanitary necessity is to prevent any contamination of the paper in packing, transporting, cutting into milk container shapes, transporting, storing, and handling at the milk plant.

To put in practice measures to protect the paper against contaminations, certain specific requirements will be necessary. Packing the material in a certain way, medical examination of those that must handle the paper and proper facility for storing the paper so that it will not be contaminated by dust, insects, vermin or contaminated human hands must be adopted.

Since this study was started a tentative sanitary requirement for paper milk containers has been proposed by a conference held in New York City in July, 1937. Although these proposed standards are good, they probably should be more exacting.

When the paper is so made that it is practically sterile, when it and the containers made from it are handled, packed, transported, and stored in such a manner that they will not become contaminated, and when the containers are paraffined at 185° F. for 30 seconds or longer, the paper containers will be fully as safe as any container can be made.

2533 Increasing the Efficiency of Milk Distribution

R. W. Bartlett

Department of Agricultural Economics
University of Illinois
Urbana, Illinois

For the United States as a whole two major conflicting forces in the milk business are now in operation: (1) a marked upward trend in milk distribution costs and an increased spread between the retail prices of market and evaporated milk, and (2) an increasing proportion of milk sold in stores and an increasing use of paper bottles. While canned milk competition is in the picture, the principal struggle is between retail delivery and store distribution of milk, with stores slowly but surely taking a part of the business of the older, established system of milk distribution.

The situation varies much in different sections of the United States. Starting in New York City, more than 20 years ago, store distribution of milk has shifted from "dipped milk" sales which were ruled out in June, 1933, to store sales of milk in paper containers. The City Department of Health reports that at present approximately 2,400,000 individual packages containing quarts or smaller quantities of milk or cream, are used daily in New York City, about 600,000 of which are single-service containers. During the past year, the price of Grade B milk on retail routes has been 13 cents a quart as compared with 9 or 10 cents a quart, the usual store price for milk. Including store sales in glass bottles, about one third of the milk

consumed by New York customers is purchased through stores.

The First National Stores have been selling milk through stores in Boston since 1921. Starting with a price differential below the retail delivered price of 4 or 4½ cents per quart, this has gradually been reduced to a differential of 1 cent a quart, fixed by the Massachusetts Milk Control Board.

With the beginning of the depression (1929-1934), competitive forces in California began to operate with such force that they utterly disorganized the retail distribution of milk in Los Angeles, San Francisco, Fresno, and several other Californian cities. The proportion of store sales in these cities increased at a remarkable rate as a result of low consumer incomes and low store prices. For distributors this trend has meant that the higher profits were to be found in wholesale distribution. Instead of being a depression situation of temporary nature, this change is likely to be permanent. As evidence of this trend, the Borden Company recently turned over all of its retail business in California to another company, and is now doing a 100 per cent wholesale business in that state. This policy, adopted by one of the most progressive concerns in the milk business, is an indication of the far-reaching significance of the present trend in the milk industry.

2534 Well established in New York and Boston on the eastern coast, and now deeply rooted in the western coast, the movement toward an increasing proportion of store sales of milk is gradually extending to the in-between cities. Detroit is now a battle-ground of conflicting forces with store sales of milk gaining substantially. Dairy stores, started in the twenties by the Isaly Dairy Company of Youngstown, Ohio, are now numerous in Pittsburgh, Pennsylvania. Recently the Borden Company opened up a chain of dairy stores in Columbus, Ohio. Since 1933, the Farmers' Equity Union have opened 21 dairy stores in and around Lima, Ohio.

What about the paper bottle? Starting in New York City in 1930, the paper bottle is now used in the wholesale distribution of milk in Philadelphia, Pittsburgh, Los Angeles, Cleveland, Detroit, and Baltimore (Table 1), as well as in many smaller cities. At present, its use in Los Angeles is limited principally to the hilly districts, and for sea-going vessels.

Table 1.—The Use of the Paper Bottle in the Distribution of Milk in Cities with More Than 500,000 Population, October, 1937[a].

City	Date first used
New York	1930
Philadelphia	1933
Pittsburgh	1933
Los Angeles	1933 (est.)
Cleveland	1935
Detroit	1937
Baltimore	1937

"What does increasing store distribution, increasing use of paper bottles, as well as increased competition of evaporated milk, mean to my business?" the forward-looking milk dealer may well ask. While no attempt will be made in this paper to answer completely this question, some facts will be reviewed and analyzed which, it is hoped, may be helpful in suggesting an answer.

Increasing Spread Between Retail Delivered Prices of Market Milk and Retail Store Prices of Evaporated Milk

Eighteen years ago, a housewife paid 1 cent more for a quart of milk delivered to her doorstep than for a can of evaporated milk purchased at the store[1] while in Octo-
ber, 1937, she paid 5.1 cents more than the average
2535 price of market milk in 51 cities was 12.7 cents per
quart, whereas a 14½-ounce can of evaporated milk cost 7.6 cents in these same cities.[1] The trend in the price spread between these two commodities from 1919 to 1937 is shown in Figure 1. One should particularly note the upward movement since 1933. In view of this increasing spread, it is not difficult to understand the present healthy condition of the evaporated milk industry. A question which naturally arises is: What caused this wide increase in spread?

[a] Cities in this population grouping which are not using paper bottles in the distribution of milk are: Boston (not used for milk, but used for cream), Buffalo, Chicago, Milwaukee, Minneapolis-St. Paul, St. Louis, and San Francisco.

1. In 1919, evaporated milk was distributed in 16-ounce cans. In this study prices were converted from the 16-ounce can to the 14½-ounce can by multiplying by .90625 for the period 1919 to December, 1931, when the 14½-ounce can was put into general use by the evaporated milk industry.

1. As reported by the U. S. Bureau of Labor Statistics.

Major Decrease in Costs of Processing and Distributing Evaporated Milk

Studies indicate that the major cause for this increase has been the marked decrease in costs of processing and distributing evaporated milk without a corresponding decrease in costs for distributing market milk.

In 1937, canned milk distributors received 4.6 cents per 14½-ounce can for processing and distributing evaporated milk, or only slightly less than half of the 8.7 cents per can received in 1921 (Figure 1). Loaded with stocks following the loss of their European outlet in 1920, canned milk manufacturers in 1922 lowered their handling margin 2 cents a can from the margin prevailing in 1921. Once started, they have continued their program of lowering costs, so that present margins have been reduced another 2 cents since 1922, and the results of this policy have increased sales. In contrast to the 1920-21 slump, when they were forced to cease operations, during the recent depression (1929-1933) condenseries have been kept running continuously and have emerged in a much stronger financial position than the market milk business.

Handling Margins for Market Milk Remain High

Since processing and retailing milk to consumers include a high proportion of inflexible costs, leaders in this industry have been unable to compete with the canned milk industry in reducing costs. Using the difference between the retail price per delivered quart and the average receiving station price paid producers in eight cities[2] as a rough measure of the trend of distribution costs in the larger cities, one finds that the present gross handling margin in these cities is fully as high as that in 1921 and nearly as high as in 1930, the peak year (Figure 1). It declined somewhat in 1932 and 1933, but during the past four years has been rising rapidly.

Market Milk Prices to Producers Slightly Higher Than Condensery Prices

Market milk prices paid to producers average somewhat higher than prices at the condensery. Reduced to a quart basis, however, this difference is relatively small. From 1919 to 1937, market milk prices paid producers at receiv-

ing stations tributary to eight large markets[2] have ranged from 0.6 to 1.3 cents per quart higher than the average price paid for condensery milk in the United States (Figure 1).

A review of the changes in these premiums indicates that they have been of only minor importance in increasing the margin between retail prices of market milk and canned milk.

2. The cities included are: New York, Boston, Detroit, Milwaukee, Chicago, Philadelphia, St. Louis, and Minneapolis-St. Paul.

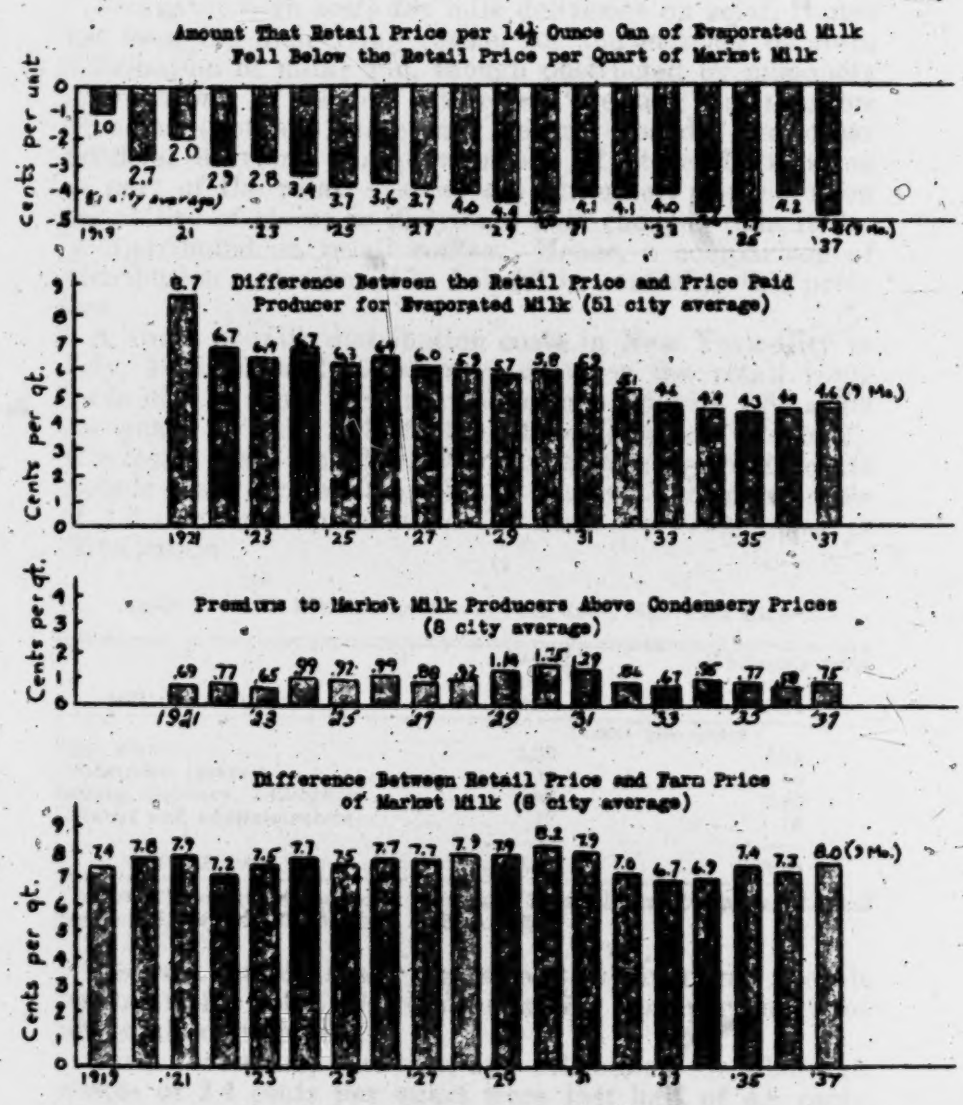

Fig. 1.- Some Measures of Differences in Prices, 1919-1937

2537 **Retail and Wholesale Distribution Costs**

Relatively high costs for milk deliveries on retail routes has been the underlying reason for the increase of store distribution of milk; and, though obstructed by monopoly combinations of various interests, "freezing" of margins by some (not all) state milk control boards, and other artificial barriers, the permanency of store distribution as part of the retail system will ultimately depend upon the ability of stores to distribute milk cheaper than it can be distributed on retail routes. Hence, a comparison of distribution costs should be helpful in analyzing this problem.

A study of milk distribution costs in New York City in July, 1935, showed an average cost for the retail route trade of 6.35 cents per quart, as compared with 3.85 cents per quart for milk sold to the wholesale trade (Table 2). Wholesale costs include delivery costs to stores but do not include costs for handling milk at stores. City plant costs of 1.2 cents per quart were the same for both types of distribution.

Table 2.—Milk Distribution Costs, July, 1935, New York City.[a]

Milk dealers costs	Retail route trade	Wholesale route trade to stores
	(cents per quart)	
City plant	1.20	1.20
Containers (glass)	.20	.10
Selling, delivery, collections	4.80	2.40
General and administrative	.15	.15
Total cost	6.35	3.85

[a] From "The Spread Between Farm and Retail Prices for Milk," Leland Spencer, American Cooperation, 1935, p. 495.

The cost for containers (glass bottles) averaged .2 cents per quart for retail distribution, and .1 cent per quart for wholesale distribution.

Costs for selling, delivery, and collections for wholesale routes of 2.4 cents per quart were just half of 4.8 cents, the unit cost for these same operations on the retail routes. General and administration costs of .15 cent per quart were the same for both types of delivery.

Costs for store distribution were not computed in this study. Although some people question their ability to

handle it on such a small margin, many stores in New York City are handling milk for 1 cent a quart at the present time.

Comparison of Milk Distribution Costs in Glass Bottles and in Paper Bottles

The use of the paper bottle in the store distribution of milk in New York City has expanded with amazing rapidity, particularly during the past two years. In marked contrast, the glass bottle is still the usual type of container for store distribution of milk in Boston. A study of wholesale distribution costs in these cities may help to explain the situation.

2538 As stated, milk distribution costs to the wholesale trade in New York City for July, 1935, averaged 3.85 cents per quart. These costs were based upon distribution of milk in glass containers.

Costs for distributing milk in paper bottles by the Dairy Sealed, Inc. of New York City, a subsidiary of the Borden Company, were filed at a hearing before the New York State Milk Control Board in May, 1936. Total costs of wholesale distribution for January to March, 1936, as shown by this record, averaged 3.24 cents per quart. This was about three-fifths of a cent a quart less than costs of distributing milk in glass bottles, as shown in the New York cost study made six months earlier (Table 3).

Table 3.—Milk Distribution Costs on Wholesale Routes in Glass Bottles and Paper Bottles, New York City.

Milk dealers costs	Wholesale routes	
	Glass bottles July, 1935[a]	Paper bottles[b] Jan.-Mar., 1936
	(cents per quart)	
City plant	1.20	.614
Containers	.10	1.347
Selling, delivery, collections	2.40	1.025
General and administrative	.15	.264[c]
Total cost	3.85	3.240

[a] Same source as Table 1.

[b] Data as presented at a hearing before the New York State Milk Control Board, May, 1936, by the Dairy Sealed, Inc., a subsidiary of the Borden Company.

[c] This includes the billing and collection expense amounting to .05 cents per quart.

Breaking down these figures, one observes that city plant costs for processing and bottling milk in paper bottles were about one half those for performing the same operations with glass bottles. Use of the single-service container eliminates all costs of labor, space, equipment, and power, necessary for handling, washing, and storing glass bottles.

Selling, delivery, and collection costs for paper bottles averaged about 1 cent per quart, as compared with 2.4 cents per quart for the same service with glass bottles. Probably the greatest saving in delivering paper bottles has resulted from speeding up the servicing of stores. With no returned bottles, and collections delegated to an afternoon service man, a route delivery-man now commonly services an average of ten stores an hour. The use of paper containers also reduces to one third the space required for glass bottles, and reduces the weight from an average of 61 pounds to 28 pounds per case of 12 quarts of milk In fact, with the use of dry ice in insulated trucks, it is now practical to service stores within a radius of at least 75 miles from the main plant. This eliminates high sub-station costs for labor, space, and equipment, as well as costs for icing milk at this station.

2539 The limiting factor in the use of paper bottles is the cost of the container. These studies show a cost of 1.347 cents per quart for the single-service container as compared with .1 cent per quart for the glass bottle. Undoubtedly the cost of this container has been reduced during the past two years as the number used has increased.

The fact that the distribution costs for store deliveries in New York were found to be cheaper with paper bottles than with glass bottles does not necessarily mean that this same condition holds true in other cities. In comparing wholesale costs of distribution in Boston with those for the Dairy Sealed, Inc., of New York, one finds that the New York costs of 3.24 cents per quart exceeded those at Boston, where wholesale distribution of milk in glass bottles averaged 3.09 cents per quart (Table 4).[1]

1. The accounting system used in computing distribution costs in New York City differed from that used in computing these same costs in Boston. While this might affect the distribution of costs between different items, it should not seriously affect total costs per unit.

Table 4.—Milk Distribution Costs on Wholesale Routes in Glass Bottles, Boston, and in Paper Bottles, New York.

Milk dealers costs	Boston[a] Glass bottles 1935	New York[b] Paper bottles July, 1935.
	(cents per quart)	
City plant	.85	.612
Containers	.12	1.347
Selling, delivery, collections	2.04	1.025
General and administrative	.08	.254
Total wholesale cost	3.09	3.24

[a] From Summary Report on Cost of Distributing Milk in the Boston Market, October, 1936 (pp. 21 and 22). Prepared for the Massachusetts Milk Control Board by the Charles F. Rittenhouse and Company, Certified Public Accountants.

[b] Same source as Table 1.

During the past two years costs of retail deliveries have increased, while apparently store costs of retail distribution in paper containers have declined. One dealer in New York City is reported to have reduced wholesale distribution costs to 2.8 cents per quart. This tendency toward reduction in wholesale costs of distribution when retail delivery costs are rising, is a powerful force for expanding the store distribution of milk.

Summary and Conclusions.

A review and analysis of the facts shown in this paper indicate that:

1. The evaporated milk industry has made remarkable strides during the past 16 years in lowering costs for distributing their product.

2540 2. The market milk industry in the larger cities apparently has failed to keep pace in its retail operations with the canned milk industry in lowering distribution costs. Today retail delivery costs fully as much as it did 15 to 20 years ago.

3. The proportion of store distribution of milk has been increasing in recent years as a result, at least in part, of distribution costs lower than those for retail deliveries. With this increase in store business, it is important to note that it has not displaced retail deliveries, nor is there any indication that either is about to crowd out the other. These two types of enterprise are in keen competition. At the

present time, each is more efficient because of the other's competition. And because of this competition consumers are getting the benefit of increased efficiency.

4. The introduction of paper bottles in the store distribution of milk is economically sound to the extent that it lowers distribution costs and is accepted by consumers. If the use of paper bottles continues to bring about lower costs for the store distribution of milk coincident with rising costs of retail deliveries, one may expect the use of the single-service container to continue to expand.

5. In view of the adequate plant capacity of milk distributors now in business, it is to be hoped that further shifts from retail deliveries to stores will be brought about largely by distributors now in the business rather than through the duplication of facilities by new enterprisers.

2541 The Practicability of the Paper Milk Container.

P. H. Tracy
Department of Dairy Husbandry
University of Illinois
Urbana, Illinois

For many years glass bottles have been the accepted container for milk. Although the life of a glass bottle is limited, its adaptability for washing and sterilizing, and its transparency (which increases the sales appeal of the contents) have enabled it to easily maintain a complete monopoly in the milk industry for the past 20-30 years.

With the recent development of store selling of milk there has come a demand for an inexpensive single service type of milk container. The store shopper naturally prefers to buy milk in a package that does not have to be returned, and one which can be conveniently and safely carried to the home. To meet this need several paper milk containers have been developed.

According to Winslow (The Production and Handling of Clean Milk, pp. 140-142, 1907-1909), the paper milk container was invented by G. W. Maxwell of San Francisco, and first used by dairymen in Los Angeles. These early containers resembled an ordinary drinking glass and were sterilized by dipping into paraffin at 220°F. A special machine was used for filling and capping. According to Winslow the advantages of the paper containers are freedom from germs, no breakage or loss of bottles, no bottle wash-

ing and sterilizing necessary, and reduced weight in transportation.

The first extensive commercial use of paper containers was probably in New York City in 1929. Since this time, however, the single service container has been introduced into several of the larger cities all over the country. There are in general three types of containers used, namely, those prefabricated and requiring a special filling machine, those prefabricated but not requiring a special machine for filling, it being possible to use the regular glass bottle filling machine, and, finally, those that are formed and paraffined in the dairy just before filling, requiring of course a special machine for the purpose.

While it is our intention to study all three types of containers from the standpoint of their sanitary qualities, adaptability for dairy plant operation, and acceptance by the consumer, the present report will deal, only with that type of container formed and paraffined immediately before filling. The container used for this purpose was the Pure-Pak. The machine necessary for preparing and filling the container was supplied by the Ex-Cell-O Corporation, Detroit, Michigan.

The machine, without the platform, covers a floor space of approximately 2½ feet by 24 feet, and weighs 5 tons. The printed containers are fed into one end of the machine where they are first formed and the bottoms glued
2542 down, after which they pass into the hot paraffin bath where they remain for 18 seconds. They then drain for 12 seconds longer before passing out of the hot paraffin compartment. The temperature of the paraffin and the air above may be varied but the minimum recommended by the manufacturers of the machine is 170°F. The container next passes through a cooling chamber where a blast of 40°F. air solidifies the paraffin and cools the container. The container is then filled with milk and any excess foam is removed by a blast of dry steam. The top is folded in, heated, and pressed along the edges so as to seal the closure. A hot (400°F.) wire staple is inserted to secure the seal, and finally the day of the week is stamped on. The containers of milk are then packed twelve to a case. The paper case of twelve bottles weighs approximately 28 pounds.

The amount of paraffin necessary for coating the containers varies from about 12 to 15 grams. As the temperature of dipping is raised the amount of paraffin retained

decreases. In our studies, two grades of paraffin were used—the high (135°-137°F.) and low (125°-127°F.) melting point paraffins. In actual tests the temperature at which the paraffin melted sufficiently to be detectable upon absorbent paper was about five degrees below the rated melting points, so that danger from paraffin melting and running into the milk would not be evident until the container temperature reached about 120°F. in the case of the low-melting point paraffin and 130°F. in the case of the high-melting point paraffin.

Since there is some bending of the paraffined paper during handling and opening, an attempt was made to determine to what extent the paraffin chipped off into the milk. The average weight of paraffin found in six bottles filled with water and hauled on a milk delivery truck for eight hours was .001 grams.

As previously stated, the foam that results from filling is removed by a small jet of steam. Foaming is more of a problem in the case of homogenized milk than regular milk. The amount of foam formed is directly related to the temperature of the milk, being greater at the lower temperature. The amount of foam dilution was found to average 0.3073 grams per quart of milk.

The amount of moisture absorbed by the walls of the quart containers was found to vary from 0.5 to 2.5 grams. Somewhat more moisture is retained by the heavy (.019 inch) paper than by the light (.016 inch) paper. The most important factors, however, were the time and temperature of storing the containers, the greatest retention taking place at the higher storage temperature and at the longer storage period.

Bulging of the side walls is one of the minor problems connected with the use of paper milk containers. A certain rigidity of side walls is desirable from the standpoint of ease of handling and prevention of leaking. The greatest bulging naturally occurs at the higher storage temperatures. Neither the weight of the paper used nor the type of dairy product placed in the container is a significant factor. Slightly greater bulging occurred when the higher melting point paraffin was used. This was particularly true when the containers were dipped at low temperatures (160° and 170°F.).

There is but slight difference in the rate of temperature change of milk in glass and paper containers, though

2543 the milk in paper warms slightly slower. When the paper and glass containers are packed in their respective cases the rise in temperature is much slower in the case of the milk in paper containers. In one experiment the milk in glass bottles in wooden cases stored at room temperature was slightly warmer after three hours than was that in paper containers stored in paper cartons after seven hours.

The detriment effect of sunlight upon the flavor of milk in glass bottles has been known for some time. While milk stored in paper containers will acquire the "sunshine flavor," the effect of the sun is not nearly so serious as it is in the case of the milk in glass bottles.

Consumer tests based upon 221 completed questionnaires returned by the milk customers on the University milk route have shown a preference for the paper in most respects. From a sanitary point of view the majority of users preferred the paper. Few thought there was any difference in the flavor of the milk, its keeping quality, and its tendency to freeze or the rate of temperature rise. It was almost a unanimous opinion that the paper containers took up less space in the refrigerator and were more convenient for picnics, etc. The glass bottle was picked for greater ease of pouring from and for ease of separating the cream from the skim milk. A slight majority preferred the paper container to the glass container when the milk sold for the same price, but at one cent less, 75 per cent indicated a preference for the paper container. Whether the milk was purchased from a store or was delivered made no material difference as far as preference was concerned.

Some of the favorable individual comments were as follows:

1.	Easier to handle by delivery man	2
2.	No washing of bottles	51
3.	No breaking or chipping of bottles	14
4.	No bottle to return	32
5.	Moisture does not condense as much as on glass	1
6.	Empty containers make garbage containers	4
7.	Excellent for picnics, pack easily and easily disposed of	4
8.	Good containers for other foods in ice box	7
9.	Containers easy to dispose of	8
10.	Good for kindling	6
11.	More easily handled	12

12. Easier to close after being opened..... 3
13. Less weight on refrigerator shelf..... 2
14. Bottles easy to open..... 4
15. Eliminates noise of bottles and cases early in the morning 3

Silver Seal Dairy Products Company
612 South 24th Street
Philadelphia, Pa.
Attention—Mr. Edward Fuller, President

Dear Mr. Fuller:

In reply to your query of November 23, regarding the use of paper milk bottles in the City of Philadelphia, we have found that they have complied with all the sanitary laws of this City, and from an inspection which I, personally, made at your plant, I believe they are most decidedly a progressive step in the sanitary handling of milk.

It might be interesting to you to know that Silver Seal milk in paper packages is used exclusively in my home. Unfortunately, however, I cannot permit you to use this statement for advertising purposes, but you are privileged to show it to any other health authority.

Very truly yours

Herbert M. Packer
Herbert M. Packer
Chief of Division

HMP/ER

November 28, 1936.

Mr. Edward R. Fuller, President,
Silver Seal Dairy Products Co.,
612 South 24th St.,
Philadelphia, Pa.

Dear Mr. Fuller:

With reference to information requested by you in communication dated November 27th.

Answering your second question first, this department does not object to distribution of milk in paper containers provided the containers are paraffined in the plant where they are filled and just prior to filling.

Milk has been distributed in paper containers in Jersey City by four large milk companies for over a year, we see nothing objectionable about this method of distribution and apparently it is satisfactory to the consumer.

Yours very truly,

Dennis J. Sullivan
Dennis J. Sullivan
Deputy Health Officer.

November 30, 1936.

Mr. Edward R. Fuller, President,
Silver Seal Dairy Products Co.,
612 S. 24th St.,
Philadelphia, Penna.

Dear Mr. Fuller:

In answer to your phone call of November 27th in reference to our finding of paper containers.

I want to say that they are without a doubt the best in our city, from a bacteria count they are almost 100%. I have never picked up a sample over 3,000 bacteria since they have been coming into our city, and I have visited your plant and find it complying with all our rules and regulations from a health standpoint.

Very truly yours,

John C. Foote,
John C. Foote,
Milk Inspector.

P. S. As you know I was opposed to the containers when they first made their appearance but after giving them a fair trial here, I will say they are a perfect container and will be a credit in any community.

John C. Foote
J. C. Foote.

2549 **PLAINTIFF'S EXHIBIT 8.**

Commonwealth of Pennsylvania
Department of Health
Harrisburg.

December 1, 1936.

Silver Seal Dairy Products Co.,
612 S. 24th St.,
Philadelphia, Pa.

Attention: Mr. Fuller, Pres.

Gentlemen:

I am very glad to give you my opinion on the use of a paper container for milk distribution.

The Pennsylvania Department of Health has for a long time approved the use of paper containers for milk distribution. This includes the paper container which is made in the factory and paraffined before shipment to the milk plant in a sealed package, and the paper container made completely in the milk plant and subjected to a bath of hot paraffin just before filling. We think this latter bottle furnishes a container for milk which more nearly meets our standards for a sterile milk container than does the glass bottle put through the average soaker type washer where it has been subjected to an alkaline treatment and later a steam or hot water treatment.

We have not been satisfied with the condition of the average glass bottle as it comes from a soaker type washer. It has been our experience that it is difficult to get a complete job of sterilization of the glass container due to the mechanical failures of the machine, the maintenance of the proper water temperatures and the fact that the glass container has gone through an alkaline solution which, because of not being changed frequently may be a source of contamination rather than a cleansing agent. We feel so strongly on this subject that we contemplate adding a last rinse with chlorinated water.

Supervision of a milk supply is much easier from a health standpoint where a paper container is in use than with a glass container. We also like the idea of the paper container being used once and then destroyed. A glass container lends itself so easily to so many uses other than that of a container for milk and so often gets back to the milk

plant in such bad condition that sterilization is such a difficult job that we could welcome the extension of the use of a paper container more generally.

Very truly yours,
W. K. Moffett

(Letterhead of Milk Control District No. 1, Ardmore, Pa.)

Silver Seal Dairy,
612 South 24th St.,
Philadelphia, Penna.

December 2, 1936.

Gentlemen:

In response to your recent inquiry, please be advised that I am satisfied that the Silver Seal Dairies have met substantially all of the requirements for the production, processing distribution and sale of milk and cream in this District and have continued to do so. I particularly favor the use of the single service container for milk distribution. The difficulties we encounter in washing glass bottles are such that I doubt that they will ever be fully overcome.

Very truly yours,
Geo. W. Grim.
George W. Grim.

2551 PLAINTIFF'S EXHIBIT 11.

(Letterhead of Health Department of the City of Baltimore.)

January 5, 1937

Mr. Edward R. Fuller,
President,
Maryland Seal Dairy Products Corporation,
56 Central Savings Bank Building, Baltimore, Md.

Dear Mr. Fuller:

In reference to the application which you filed with this department on October 9, 1936, for a pasteurizing milk plant permit and the use of the paper container (Pure Pak) for the sale of milk in the city of Baltimore, I wish

to advise you that after giving very careful study to the matter and in accordance with Article 16, Section 64, Rule 12 of Baltimore City Code of 1927, which reads as follows:

"Pasteurized milk or cream shall not be bottled or placed in other receptacles in any place other than in the plant where it has been pasteurized. No person or dealer in milk shall offer for sale, sell or deliver any milk or cream in quantities of less than one gallon unless the same be kept, offered for sale, sold or delivered in sanitary glass bottles or such other receptacles or in such other manner as may be approved by the Commissioner of Health"

I hereby approve for use in the city of Baltimore the paper container known as the Pure Pak provided the Maryland Seal Dairy Products Corporation complies fully with the following requirements of the Commissioner of Health of Baltimore City:

1) That the paper blanks are to be received by the dairy dye-cut, printed with the type of milk or milk products sold, name of the dairy, address of the dairy and the day of pasteurization, and that no advertising matter other than that required under the Cap Regulation of this department shall be contained thereon, and

2) That the paper blanks are to be shipped by the paper manufacturer to the dairy in tightly closed containers and are to be made from the best obtainable white Spruce pulp and that no discarded material is to be used in the manufacture of the paper blanks, and

2552 3) That glue used on the side seams of the blanks by the paper manufacturer is to be either of a soy bean glue or tapioca glue base and, further, that the glue used by the dairy in glueing the bottom of the container is to be also of a soy bean or tapioca glue base, and

4) That paraffin bath used for the submerging of the container is to be maintained in a flooded condition at all times so as to insure the complete submersion of the container in paraffin, and

5) That the paraffin used is to be of the highest obtainable quality and that the paraffin catch-basin is to be drained daily; further, that there is to be maintained an automatic feed of paraffin which shall pass through the smallest possible screen through which melted paraffin can pass and that the paraffin bath shall be completely drained every week or more often if necessary and that no drawn-off or salvaged paraffin from the bath shall ever be used for the paraffin of the containers, and

6) That machine shall be equipped with a thermo-regulator which will maintain at all times a temperature of 180 degrees in the paraffin bath, plus or minus, as is desired for the complete coverage of the container with paraffin, and.

7) That the machine shall be so designed as to make it impossible for any hand contact whatsoever with the container prior to its being filled and sealed, and

8) That the parts of the machine used in the filling of container shall be free from pits, cracks and crevices, and shall be so constructed that they can be readily cleansed and sterilized, and

9) That the measuring device used in connection with the filling of the container shall be set in accordance with the regulations of the Bureau of Weights & Measures, with the understanding that if any adjustments are necessary in connection with this procedure that they shall not conflict with the sanitary regulations of this department, and

10) That the Maryland Seal Dairy Products Corporation agrees to comply with all requirements of the Commissioner of Health of Baltimore City which, in his opinion, may subsequently be necessary for public health protection in addition to those hereinbefore specified.

To make the above approval binding and in accordance with the provisions of the City Ordinance I hereby request that you acknowledge receipt of this letter and that in your acknowledgment you assure me that the Maryland Seal Dairy Products Corporation will comply fully with the ten requirements as specified in this letter.

I will expect you to closely work with Mr. J. M. Lescure, Director, Bureau of Milk Control, in the approval of your plans and lay-out for your building and also the approval of the different appliances used in connection with the operation of your company.

Very truly yours,

H. Huntington Williams, M.D.,
Commissioner of Health.

2553 **PLAINTIFF'S EXHIBIT 12.**

Sanitation of Paper Milk Containers.*

By J. R. Sanborn and Robert S. Breed,**
New York State Experiment Station, Geneva, N. Y.

The present discussion will necessarily be limited to a study of paper milk containers from the standpoint of the laboratory. If information is desired regarding the practical problems involved in their use, savings, cost, relative merits of various types of containers, etc., it will be found that the men in the industry that have had real experience can answer these questions better than anyone else.

It so happens that the use of paper milk containers has been greatest in the New York metropolitan area. The Sheffield Farms Company, Inc., was a pioneer in a study of the practicability of these containers. Later, the Borden Company studied the practical problems involved on an even more extensive scale through their subsidiary, Dairy Sealed, Inc., of Ozone Park, Long Island. The latter plant was built to determine what economies could be effected where all milk and cream handled in a milk plant was packaged in paper containers.

The results of our own sanitation studies are presented here in a series of tables. A map (Fig. 1) has also been prepared which gives the location of cities where installations have been made for bottling milk in paper containers. Such containers are also used in many other cities for minor purposes, such as for delivery of milk and cream to quarantined residences, and distribution of buttermilk and other dairy products. The map is not entirely accurate as rapid changes are taking place, but it is reasonably so. Approximately 1,200,000 single service milk and cream bottles are used daily in this country.

---

* Presented before the Laboratory Section of the 31st Annual Convention, International Association of Milk Dealers, Cleveland, Ohio, Oct. 18, 1938.

** Approved by the Director of the New York State Agricultural Experiment Station for publication as Journal Paper No. 300, December 7, 1938.

Figure 1

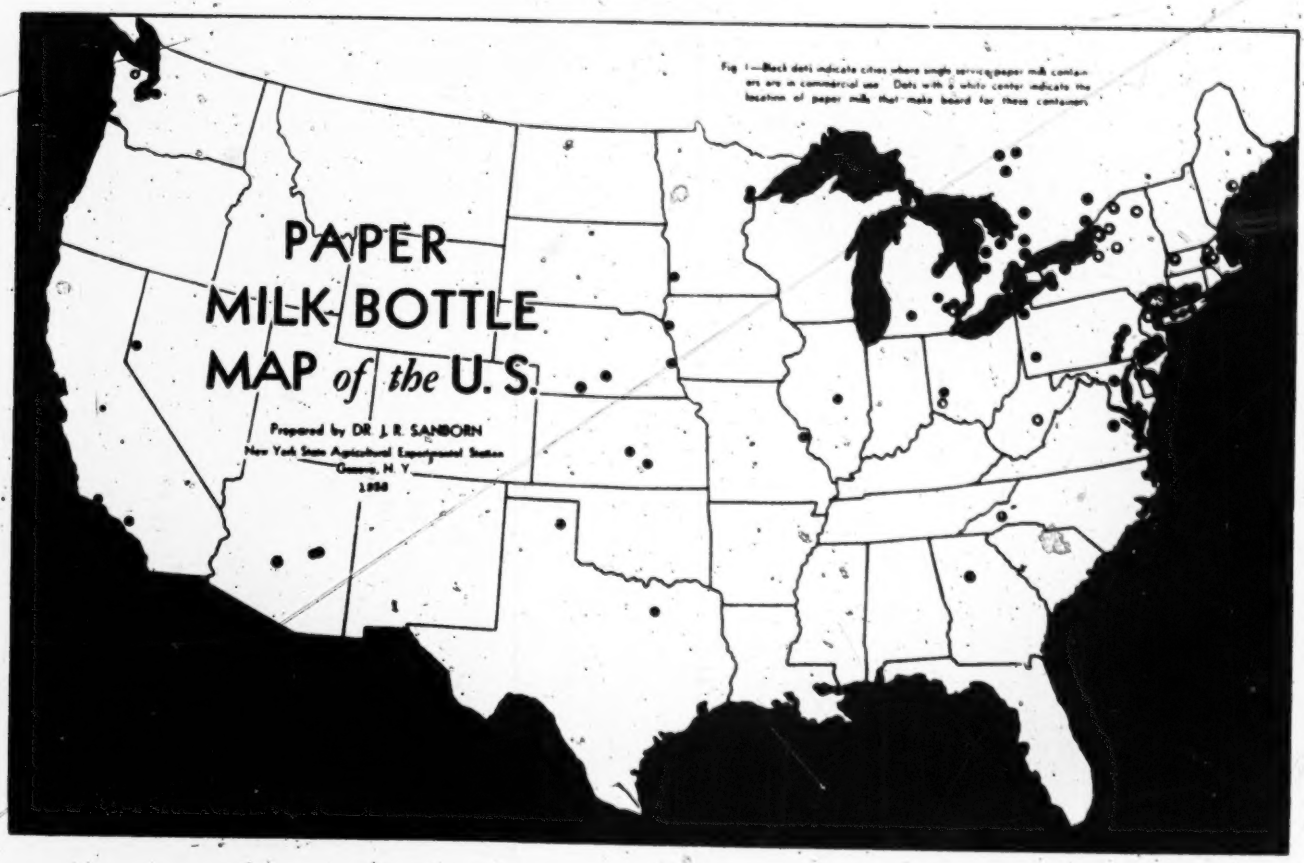

Fig. 1—Black dots indicate cities where single service paper milk containers are in commercial use. Dots with a white center indicate the location of paper mills that make board for these containers
PAPER
MILK BOTTLE
MAP of the U. S.
Prepared by DR. J. R. SANBORN
New York State Agricultural Experiment Station
Geneva, N. Y.
1950

The location of paper mills that make the paper board used for these milk bottles is indicated on the map by the use of black dots with a white center. A surprising number of them are located in the area in and near New York State.

As some persons may not be familiar with the various types of single service milk containers, two photographs are shown. The first (Fig. 2) includes paper containers that have been tried out in at least one practical installation. Some containers are filled from the top, some are filled from the bottom; some are completely fabricated, others are partially fabricated, and still others are made from blanks and paraffined in the milk plant just before they are filled with milk or cream.

As a matter of general interest a second photograph (Fig. 3) which includes types of single service containers in use in Canada and Europe. These have been secured from investigators in other countries whose replies indicate that no other country is using this type of container as extensively as is the United States. It is stated that about 400,000 are used daily in Great Britain and that plans are being made to double this number in the near future.

The pictures give some idea of the varied nature of these containers. There may be some that find advantage in this fact but there are many that find diversity a disadvantage.

Figure 2

Figure 3

Fig. 2 (above)—Paper milk containers in commercial use in the U. S. A.
Fig. 3 (lower)—Paper milk containers in use in other countries.

As soon as a real study of the sanitary problems affecting the use of paper milk containers is started, it becomes evident that this is only a part of the larger problem of the sanitary use of paper wrappers and containers for all kinds of food. While milk is the most perishable and easily contaminated food that is placed in paper containers, other perishable foods such as dairy products (sour cream, frozen cream, cottage cheese, ice cream, etc.); oysters, meats, or less perishable products such as bread and the like, deserve really clean and sanitary handling in paper containers and wrappers. Much attention has been given by the paper industry to the development of sanitary wrappers and containers; but their efforts have never been extensively studied and judged by outside agencies. In fact, no very satisfactory methods have been developed for doing this.

In the case of paper milk bottles, there are two general classes of sanitary problems (1) those that arise in the making of containers themselves and (2) those that arise in connection with the shipping, storage and use of the containers in milk plants.

In the present report chief attention is given to the sanitary problems that arise in connection with the making of the containers. The nature of the second type of problem is well indicated in the suggested sanitary regulations developed in connection with two conferences on this subject that have been held at the Experiment Station at Geneva.* They concern proper methods of shipping, storing and handling of finished containers, proper methods of filling containers with milk and cream, and proper methods of keeping filled containers cool and clean until delivered to the consumer.

The most important measure of sanitation that is applied to the finished container is to determine its bac-

* Jour. Milk Technology, 1, 1938, 47-53.

Table I—Rinse Counts Obtained from Various Types of Containers

7	74	12	60	36	4	0	0	—	—	—	—	—	—

teriological condition as filled with milk. This is
2554 partially accomplished by rinse tests. As soon as rinse tests were made it was found that the paper containers were so nearly sterile that some modification was needed of the usual standard rinse procedure for glass bottles which is carried out by rinsing with 100 c.c. of sterile water. The tests of the paper containers have been carried out by rinsing with 10 c.c. of sterile water, the entire amount of the rinse water being used as an inoculum in one large or three ordinary size petri plates. Because frequently under these conditions no colonies developed on the agar plates, an even more severe technic was developed. In this technic 10 c.c. of sterile broth was added to each of a series of finished containers. After shaking and incubating, the percentage of containers in which the broth remained sterile was noted.

Table I shows the results obtained from the examination of nearly 8,000 paper milk bottles of seven different types. The work was done in a series of nine cooperating public health and industrial laboratories, duplicate lots of containers being collected by random sampling, carried out under supervision in 12 different factories or milk plants. As an improvement in conditions was noted as the work progressed, results are arranged so as to contrast the findings secured in 1937 with those secured in 1938. This improvement is noted best by comparing the number of containers examined in 1937 that show no growth of colonies on the plates (Column 3) with the similar results obtained in 1938 (Column 9). A few containers were found that gave counts in excess of 500 per container. The number of these found in 1938 (last column) was somewhat lower than the number found in 1937 (Column 8). It is not clear why these higher counts occur. The number of these counts is always small and their appearance in a series of counts irregular. It is even possible that faulty technic may account for some of them. It is very rare for any of these higher counts to reach a size greater than one per c.c. of capacity, the standard usually accepted as a reasonable one for milk containers.

While the cause of these higher counts is being sought in an effort to eliminate them, the significant figure to note is that, regardless of the type of container, the number of essentially sterile containers is large. In 1938, all containers tested showed more than 70 per cent with counts

less than 5 colonies per container, not per c.c. the commonly used unit of measurement for bacterial counts from milk.

In other words, the number of bacteria added to a quart of milk from a paper container even where the number present in the container is relatively large is still so small that it would cause no detectable increase in the count per c.c. of milk. In fact, a container that yields a count of less than 5 colonies per container may be regarded as essentially sterile.

Moreover, when the nature of the few bacteria present is determined it is found that they are common non-pathogenic, spore-bearing bacteria (Bacillus subtilis, Bacillus cereus, Bacillus mesentericus, etc.), saprophytic micrococci, sarcinae, and actinomyces, and some spores from wood fungi. All of these, with many other microorganisms, are found in the pulp suspension as it is carried to the paper machine and over the hot drier rolls in the paper making process. The surviving organisms are all of very heat resistant types as the temperatures reached are much higher than those used in the pasteurization of milk. No pathogenic organisms could survive the temperatures used.

Milk container board is made from virgin stock so far as we have discovered in visiting a dozen mills making this type of paperboard. Some of the stock may be ground wood pulp but it is usually chemically purified by the sulfite or sulfate process. A variety of coniferous trees are used for the logs out of which the paper is made. In the Eastern United States, a variety of spruces are used, such as white, black and red spruce. Eastern hemlock and balsam fir logs are also accepted. In the south, the southern yellow pine is used and in the northwest, western hemlock. The pulp made from the washed logs is usually sterile either as made by the hot grinding process, or as it comes from the chemical digesters. However, as the pulp is floated in water and allowed to circulate through pipes and chests, microorganisms develop almost as readily as they do in milk. Where dead ends are found, storage of white water is practiced, or other conditions are permitted that allow opportunity for growth of bacteria and other microorganisms, they develop in large numbers.

For this reason, a determination of the number of living bacteria per gram of disintegrated board becomes a meas-

ure of the bacterial condition of the pulp. This record secured from the finished product even more accurately interprets conditions previous to the paper making processes than similar counts from pasteurized milk interpret the bacteriological condition of the raw milk.

Table II shows the results obtained from plating disintegrated pulp from 824 samples of board manufactured

Table II—Bacterial Counts Per Gram of Disintegrated Paperboard Obtained Between July, 1937, and October, 1938.

Grades of Paper	Total Number Tests	Percentage showing no growth	Percentage yielding counts between 1-50	51-100	101-250	251-500	501-1,000	1,001-10,000	10,001-40,000
Paperboard of Virgin Stock									
Milk container board	824	5	30	26	21	10	8	0	0
Ice cream and butter boxes; cut, plate, cap stock	77	4	47	35	7	5	2	0	0
Paper straws	25	44	56	0	0	0	0	0	0
Paperboard containing Secondary Stock									
Fiber cans, breakfast food cartons, etc.	52	0	0	0	0	10	8	48	34

for use in milk bottles. About 5 per cent of these tests yielded plates that did not develop any colonies. Such sterile plates have been found more frequently in recent months since the paper mills have given greater attention to maintaining better conditions in their plants. Some counts have, however, been higher than 500 per gram of board and have even reached a thousand per gram of board where mill operators have not yet succeeded in bringing about proper conditions in the mills.

Results secured from the disintegration of paper straws shows even lower counts than those from the milk bottle board. The low counts are probably due to the fact that the thin walled straws are impregnated with paraffin at a very high temperature, rather than because they are made from better pulp than the milk bottle board.

Seventy-seven tests of ice cream containers, butter

boxes, cup, plate and milk bottle cap stock made from virgin stock yielded results much like those secured from milk bottle board.

However, when paper materials containing secondary stock (envelope trim, old newspapers, waste papers, etc.) are examined the counts are much higher. Stock of this sort is used in some ice cream cans, breakfast food cartons and the like. No counts were obtained from boards containing secondary stock that were lower than 250 per gram of stock and 34 per cent of the counts were greater than 10,000 per gram. None exceeded 40,000 per gram. Counts that indicate the presence of numerous bacteria are common as less care is given in making the board that is used in packaging dry foods than is given board used in packaging moist, easily contaminated foods.

If Table II had been arranged so as to contrast results secured in 1937 with those secured in 1938, improvements would have been shown particularly where mills have given special attention to the production of a paper board that is essentially sterile.

Some public health officials have said to us, "Why worry over a few bacteria that may get into milk from wood pulp when they are of harmless types? The number of harmless bacteria in the best of our milk supplies is so large per quart bottle that the addition of 5 to 250 per bottle from the wood pulp is meaningless?"

This is really true but our answer has been, "When it is easily possible to have the containers essentially sterile, why not have them so?" In fact, we believe that the paper industry will really effect economies in making a sanitary paper board sufficient to pay the additional costs involved.

Some factors other than the bacteriological condition of the board help to determine the final count. Adhesives are used in the making of all paper milk bottles. Unless the adhesive is sterile, bacteria may be added to the container in quite large numbers. If fermentable starchy, or casein adhesives are used, care must be taken to keep them sterile. The thermoplastic, non-fermentable adhesives that are coming into general use are even better.

Moisture proofing also influences the rinse count of the finished container. If this is not done efficiently the milk may soak into the paper board used for bottles or bottle caps and become contaminated with such bacteria as are

found in the board. When the paraffining is done properly, the bacteria are held in the board and thereby prevented from appearing in the rinse water.

Efficient coating with paraffin is dependent upon many things, but in a general way, the best coating is accomplished at temperatures between 165 and 175° F. Where high temperatures are used (250° F.) to impregnate the board, a second paraffining is sometimes used at the lower temperature in order to coat the board. Where board is left partially exposed as may occur when temperatures over 175° are used, rinse counts from such containers are usually higher than from well coated bottles. This happens even though the high temperature used in paraffining might be expected to kill the bacteria more effectively. Where containers are not effectively moisture proofed, successive rinses with sterile water yield counts as high as those from the first rinse even after as many as ten trials.

From these data, it is evident that paper milk bottles are capable of meeting very severe sanitary standards as indicated by the success thus far attained in making board with a very low bacterial content and by the very low rinse counts of the finished containers. The sanitary condition of the finished container is comparable with the sanitary condition of the glass bottles found on well operated certified farms. Rinse counts for glass bottles as washed and sterilized in ordinary milk plants are higher and sometimes much higher than those obtained from paper bottles. Data supporting this statement will be found in the general summaries prepared by the Committee on Milk Supply of the Public Health Engineering Section of the American Public Health Association.* In these reports it is stated that only 56.9 per cent of the glass bottles examined from milk plants met a standard of less than one bacterium per c.c. of capacity, i. e., approximately 946 per quart container.

In a general way, paper containers can, therefore, meet much more severe rinse count standards than the average glass bottle provided they are properly handled and stored in the interval between the time when they are manufactured and the time when they are filled with milk. Improper conditions are detectable by the local dairy inspection group and can be eliminated where the industry un-

* Yearbooks for 1933-34, p. 72, and 1934-35, p. 160.

derstands the situation and the dairy inspector carries out his duties.

Several makers of paper milk bottles feel that they can maintain higher standards of sanitation during the manufacture of these paper containers where this manufacture is carried out under their own supervision in their own factories. Other makers supervise the fabrication of their containers in milk plants. It would seem as though the place where the sterilization is accomplished is not a vital issue. The important matter is to have the finished containers clean and essentially sterile when filled with milk. In all cases, we feel that the single service containers should be able to meet a standard of freedom from pathogenic organisms even more severe than those enforceable for our present milk containers.

Single Service Containers for Milk and Milk Products.

J. R. Sanborn and Robert S. Breed.

New York State Agricultural Experiment Station, Geneva, New York.

Recent Developments in Paper Milk Container Sanitation.

The single service paper container for milk and milk products in being subjected to critical sanitary investigation. Since last summer, two paper container conferences have been held at the New York State Agricultural Experiment Station for the purpose of considering problems in standardization and control. Those present included public health officials, paper container manufacturers, research workers, and representatives from the dairy and pulp and paper industries. Recognizing the definite place that single service containers seem destined to occupy in milk distribution for metropolitan areas, these conferences discussed improvements in and control of methods of manufacture and handling so as to secure the highest possible sanitary quality. In New York metropolitan district, paper milk containers have been allowed to develop normally, which has been particularly helpful in revealing both the satisfactory and the unsatisfactory features involved in their manufacture and use. In this way it is possible to work effectively toward correcting undesirable conditions.

In the course of its relatively brief period of practical use, the paper milk container has spread thoroughout metropolitan New York and reached various cities of the middle West, South and West Coast, extending to Seattle and Los Angeles and into Canada. One milk plant in New York City which, in March, 1937, turned out daily 160,000 to 180,000 paper packages of milk and cream, had increased its output in June of last year to 250,000 packages. It is estimated that the daily use in this country of milk and cream in paper amounts to approximately 1,200,000 of these single service containers. Almost one-half of this production is used in New York City. Over one hundred towns and cities in the United States and about thirty in Canada, employ

paper containers regularly for the distribution of milk and cream. Their use for buttermilk and other milk products is practically universal.

Public Health Significance.

Public health agencies are availing themselves more and more of the benefits which may be derived from the use of single service containers. In cases infectious disease, delivery of milk in paper containers is an important factor in control. There are indications that this means of distributing milk may decrease incidence of contagious disease during epidemics and eliminate the possibility of spreading pathogenic organisms from house to house. The use of single service containers for milk is advisable in quarantined residences, hospitals, and other institutions caring for infectious diseases.

Bacteriological Control in the Manufacture of Milk Container Board.

The pulp and paper industry little realized the situation it was facing when it attempted to put such a perishable food as milk in paper. While clean, sound pulp wood is an entirely suitable raw material for the fabrication of containers for perishable foods, conditions for the manufacture and handling of pulp and paper are sometimes not sufficiently clean and sanitary to meet public health standards. In order to secure and maintain a high standard of sanitary quality, a group of mills producing milk container board has undertaken an extensive program of microbiological control and voluntary inspection. Wood pulp is produced in a bacteria-free state and it is the purpose of these mills to utilize methods of treatment and handling that will preserve the bacteriological and chemical purity of food wrapper and container stock. The methods used are based upon cleanliness, process water purification and bactericidal treatments.

The paper produced by most of these mills is of high sanitary quality and as nearly sterile as it is possible to make it. Milk container board is carefully wrapped and shipped under conditions that protect rolls of paper or sheeted stock from contamination. Container factories, converting plants and dairies are becoming increasingly appreciative of the

importance of maintaining the clean and bacteria-free condition of the foundation board. Investigation has shown that the sanitary state of this board usually determines the sanitary state of the finished containers. Methods and facilities for handling or manipulating this board must not, therefore, nullify the sterilizing effects produced during its manufacture. These effects may be preserved or enhanced through the development of efficient methods of container fabrication.

The lessening of human contacts with container board and the general utilization of mechanical methods of handling, provide a direct means of protecting sterile board. The sealing of containers by means of non-fermentable adhesives, preferably synthetic, thermoplastic varieties, aids in the maintenance of high quality. Finally, the application of a suitable moisture-proof coating renders the paper container sufficiently non-absorbent to serve as a convenient and efficient receptacle for receiving and distributing milk and milk products. The moisture-proofing material generally used at present is fully refined paraffin which, in addition, may also act as a secondary line of defense when applied in the hot, molten state by eliminating such organisms as may reach the container by casual contamination. Other moisture-proofing treatments are under investigation. Whatever future developments may be, however, it will always be necessary to rely upon the sanitary condition of the foundation board for uniform sterility and high quality.

Standardization and Quality Control.

Laboratory examination of container shipments includes determination of the bacterial content of paper blanks used in fabrication processes as well as of finished containers by disintegration and rinse methods. These products are also examined for sterility, efficiency of coating, dirt, slime spots and other foreign matter. The results of rinse tests and visual inspections show close correlations with bacteriological counts of the original board. Technic for making these counts has been developed and described during the present investigation.[1] It consists of repulping the board in sterile water by means of a sterilized beating device and plating the resulting pulp sus-

1. American Journal of Public Health (1938) 28; 576.

pension according to standard bacteriological procedure. The results are reported in terms of the number of colonies developing per gram of board.

Pulp and paper mills will derive considerable benefit from a knowledge of the bacterial content of a run of board and control measures, if necessary, may then be effectively employed. Container manufacturers and public health laboratories will also find such a disintegration method useful in determining quality.

A tentative board count of 500 colonies per gram has been set as a reasonable and enforceable standard. Mills will ordinarily be able to meet a much more severe standard. Due, however, to temporary partially unexplainable increases in board counts during certain seasons of the year, it seems advisable to retain, for the present the maximum count of 500. Cooperating pulp and paper mills are uniting in a program of sanitary control that should promptly bring to the paper container industry a board which is nearly or actually sterile.

In more than 500 bacteriological examinations of board from nine different mills, using the disintegration technic, 53 per cent yielded less than 100 colonies per gram. According to the best record made last year by a single mill, in 150 tests, 85 per cent of the examination yielded less than 100 colonies per gram. Samples of milk container board from this mill are sometimes essentially bacteria-free.

This is a worth-while contribution to sanitary food packaging. The use of secondary stock consisting of old newspapers, envelope clippings, chip board, and cellulose waste, in the manufacture of food containers such as bulk ice cream cans and breakfast food cartons has sometimes resulted in undesirable contaminations. The bacterial content of boards of these types usually varies from 2,000 to 50,000 per gram. For milk container board, on the other hand, only virgin chemical or mechanical pulp is employed, which is pulp that has not previously been used for commercial purposes. This high quality stock is the only kind that should be used in paper containers for perishable foods.

When food container board is made from virgin pulp using pure process water and under sanitary methods of manufacture, a paper board is produced which is free from all chemical reagents and other foreign matter, and all except a few non-pathogenic types of heat resistant bacteria.

This makes a product that is entirely suitable for direct contact with dairy products.

Reasonable Sanitary Standards for Paper Products.*

By J. R. Sanbord.[1]

Abstract.

Reasonable sanitary standards for food wrappers, food containers, paper drinking cups, and hospital cellulose are under consideration by public health authorities and purchasing departments. Bacteriological examination of paper and container board provides health laboratories with a means of determining the sanitary condition of these products and judging the probable sanitary state of mills that produce such paper. Studies of number and types of bacteria in pulp and paper show a close correlation with degrees of microbiological control established during manufacture. Effective microbiological control means adequate and consistent purification of process water; general plant sanitation and cleanliness; utilization of uncontaminated high grade pulps and raw materials; employment of bacteria-free water at calenders; effective use of bactericidal treatments; and strict methods of slime prevention.

Microbiological Problems in Pulp and Paper Manufacture.

For many years it has been known that pulp and paper mills provide favorable conditions for the growth and mul-

* Presented at the Annual Meeting of the Technical Association of the Pulp and Paper Industry, Waldorf-Astoria Hotel, New York, N. Y., Feb. 21-24, 1938.

tiplication of microorganisms. Nearly all of these organisms come from water supplies, though pulp wood and various raw materials may contribute to the contamination. The activities of pulp and paper mill microorganisms are not usually apparent to mill operators until they reach advanced stages of development, when discoloration and decomposition of pulp, slime formation, or the occurrence of spotting or objectionable odors in finished products prove a menace to production and quality. These microbiological problems, which require the application of effective preventive measure, have caused the industry much trouble and economic loss.

In spite of the care that has been given to microbiological control, investigations of certain grades of pulp and paper have repeatedly demonstrated the presence of undesirable microorganisms from pulp and paper mills. This considerable bacterial contamination already recognized by paper makers as a factor detrimental to high quality, has caused public health officials and sanitarians to view critically and sometimes doubtfully, the hygienic condition of paper products.

Sanitary Quality in Paper Products.

Health groups and purchasing departments are interested in the sanitary condition of paper used in direct contact with milk and other perishable foods, and of products for personal and medical requirements, such as paper drinking cups and hospital cellulose. In order to secure the greatest possible suitability and safety in paper for various uses, sanitary standards and specifications are being extended and strengthened.

Meeting the need of health laboratories for a routine bacteriological method by which they can determine from total bacterial counts the hygienic condition of paper and judge the sanitary state of the pulp and paper mill producing it, a technic has been devised for rapid disintegration of paper to uniform suspensions suitable for bacteriological plating.

In view of the unusual public health significance of milk, an extensive investigation is being made of the bacterial content of food container board used for single service milk containers, carried or in conjunction with microbiological surveys of mill systems. Findings indicate, first, that close

correlations exist between mill sanitation and production of high quality board; second, mills which utilize polluted or inadequately purified water and fail to effectively curb the development of microorganisms throughout the process of pulp and paper manufacture cannot produce food container board which meets the requirements of public health authorities; third, periodic laxity in water purification, slime control, and cleanliness, increases the difficulty of producing paper conforming to sanitary specifications; fourth, in mills where strict control of microorganisms is maintained throughout the year, conditions are favorable for the production of paper board having low bacterial counts.

Sanitary Status of Pulp and Paper Mills.

The sanitary status of a mill depends upon the degree to which it achieves strict microbiological control. Strict microbiological control means adequate and consistent purification of process water; utilization of uncontaminated, high grade pulps and raw materials; effective use of bactericidal treatments to prevent contamination of system from re-used process water and colonization of microorganisms. Pulp and paper mills that fail in effective control must cope with a wide variety of microorganisms, many of which are sufficiently heat resistant to survive drier temperatures and form colonies in culture dishes prepared from aseptically disintegrated board. These counts may vary from 5,000 to 50,000 per gram of board, denoting a product that is decidedly unfit for direct contact with perishable foods.

Eliminating from consideration in connection with sanitary specifications all such inferior paper products as those just described, attention is mainly directed in this investigation to those mills which exert effective control of microorganisms. Container board samples from these mills yield counts that are consistently less than 500 per gram. The majority of mills producing milk container board give counts of less than 250, in a few cases less than 100 per gram, even approaching a bacteria-free state. The lowest count boards are as free from bacteria as bleached, 100 per cent sulphite tissue. Board mills producing counts under 100 per gram with reasonable regularity are usually fortunately situated with respect to natural purity of water

supplies and freedom from common sources of extraneous contamination. Bleaching operations may also be used to augment the efficiency of bacterial control.

While the thicker the board, the higher the bacterial counts appear to be, other factors such as drying temperatures, length of time of drying process, quality of pulp employed, microbiological conditions at mills, the purity of calender water, and care taken with the finished paper, also exert a decided influence on the number of colonies developing per gram of paper.

The secret of producing paper which is low in the number of bacteria present lies in bacteriological purification of water supplies and, in order to prevent colonization and spread of organisms, effective use of bactericidal treatments within mill systems. Colonization results in the formation of small slimy masses of growth which resist chemicals and heat and introduce into pulp and paper persistent and aggressive types of microorganisms. This development in its exaggerated forms is known to the mill operator as 'slime'. Rrom the standpoint of bacteriologists and sanitarians effective control means prevention of incipient growth accumulations by eliminating contamination at its sources and utilization of specific bactericidal treatments. Recommended procedures are neither expensive nor impractical. They include persistent cleanliness, constant supervision over portions of a system in which organisms readily multiply, employment of bacteria-free water at calenders, and effective use of bactericidal agents. The chief purpose of the microbiological survey is to increase the efficiency of control measures through specific knowledge of predominating types of organisms and of local points of contamination where bacteria-killing action is needed.

Reasonable Sanitary Standards.

In the case of paper which is destined for direct contact with foods or for household, medical, or personal uses, it is desirable that these products conform to bacteriological standards now being proposed.

1. Virgin Pulp. It is generally agreed that only virgin pulp from clean, sound pulp wood should be employed for food wrappers and containers. Our definition of virgin pulp is pulp that has not previously been used for commercial purposes. Trim, which is properly handled and

protected from contamination is considered as suitable primary stock. Virgin pulp only has already been specified for milk container board, drinking cups and hospital cellulose. Even if secondary pulp can be completely sterilized during recovery, its miscellaneous content of foreign matter and dirt renders it unsuitable for use in stock for perishable foods. As a matter of fact, bacteriological tests on board containing secondary stock indicate that adequate sterilization may not take place. The results reported in Table I confirm this conclusion.

2. Slime Spots. Slime due to excessive development of microorganisms in pulp and paper mill systems, is preventable. The presence of slime spots in paper indicates to sanitarians lack of sanitary care and products containing them do not conform to specifications. Identification of this condition by bacteriologists is based on recognition of growth fragments, microorganisms, or characteristic films formed by gelatinous, rubbery, or matted forms of slime growths.

3. Bacterial Counts. Through the active interest of several mills, interesting correlations are being drawn between degrees of bacteriological control and bacterial counts in finished paper. It is known that tissue products may contain less than 50 organisms per gram and approach practical sterility. The most carefully made milk container board is comparable in sanitary quality with the best grade of tissue. While it is not expected that board mills will be able to consistently maintain counts of less than 50, they are doing their best to achieve the lowest possible counts. Nearly all of them produce counts of less than 250. At the same time, it seems inadvisable to specify

more exacting standards than the count of 500 colonies
2563 per gram of disintegrated board, originally suggested for milk container board, until the effect on these counts of seasonal variations in water supplies, temperatures, and microbiological development have been determined.

The cup and container, and milk container board counts reported below show a close correlation with microbiological surveys. Bacteriological counts obtained thus far on various grades of paper are, however, only preliminary in that they do not adequately reveal the influence of changing mill conditions throughout the year. So far as the manufacture of food container board is concerned an effort is being made to achieve consistently low counts through the establishment of control programs designed to meet seasonal and operative changes. As numbers of microorganisms are suppressed in vat stock, board counts become lower. In cases where it is possible to practically sterilize this stock, the finished board is relatively free from bacteria.

* Indicates board layers which consisted of 100 per cent bleached sulphite pulp. Other layers contained some ground wood.

The types of organisms predominating in milk container board made from virgin stock are heat-resistant forms characteristic of water, soil, or dust. While these species are clearly not disease-producing types, it is desirable from the standpoint of general sanitation and cleanliness to hold their total numbers to a minimum in paper to be used with perishable foods. Failure to control adequately this contamination may be considered an evidence of careless housekeeping.

Status Raised Through Cooperation.

Through the efforts of cooperating mills, the hygienic status of food container board has been raised to a point which renders it entirely suitable for direct contact with the most perishable and carefully processed foods. We believe that this movement toward the improved sanitary condition of paper products is economically sound and conducive to wider uses and more general acceptance of paper as an entirely hygienic and safe packaging material for the food industry.

2564 **PLAINTIFF'S EXHIBIT 18.**

When Are Milk Containers and Equipment Clean and Sterile?*

The protection of milk from contamination from the time it is drawn from the cow's udder to the time it is delivered to the consumer is the most important problem connected with the production of clean, safe milk. The two most important items here involved are the pasteurization of the milk, and the sterilization of milk containers and equipment with which milk comes in contact. Considerable and, it is believed, adequate work has been done in the establishment of standards for the pasteurization of milk. However, comparatively little work has been done in the establishment of standards for the sterilization of milk containers and equipment. The committee is of the opinion

* Progress Report of the Committee on Milk Supply of the Public Health Engineering Section of the American Public Health Association and the Committee on Milk Sanitation of the Conference of State Sanitary Engineers, presented to the A.P.H.A. at the Sixty-second Annual Meeting in Indianapolis, Ind., October 9, 1933.

that there is need for additional work along these lines, and has undertaken to report upon the present status of this subject with a view of encouraging this type of work and bringing about (1) a better understanding of the subject, (2) the development of tests for determining efficiency, and (3) eventually a standardization of these methods.

Cleaning and sterilization are very frequently associated, but they are two distinct processes and should be treated as such. Efficiency of cleaning and of sterilization are matters of particular concern to health officials. The word "sterilization" as used here and as it has been used for years in dairy work means bactericidal treatment resulting in the devitalization of milk-borne pathogens and the further material reduction of all other bacteria.

It is commonly conceded that thorough cleaning is a necessary prerequisite to sterilization.

It has been, and probably will continue to be, the practice of milk control officials to determine cleanliness by physical examination. A simple visual examination is not sufficient. It is necessary to take things apart and to dig into the corners and crevices to determine whether they have been properly cleaned. Clean surfaces should not show a greasy film. The following examples will indicate the necessity for close examination. In a certain plant all readily visible parts of the equipment appeared clean but it was difficult to take the milk pump apart, indicating that the pump was not disassembled regularly. When it was taken apart it was found to be filthy. In another instance, a surface cooler was installed rather close to a wall and the visible side appeared to be very clean. However, a close examination of the surface against the wall revealed accumulation of dirt and milk solids, indicating that the surface had seldom, if ever, been washed. The man responsible for washing the equipment had apparently fooled the owner as well as the inspector.

The cleaning of the inner surfaces of pasteurizers presents a problem in itself. Many pasteurizers are coated
2565 with milk stone which is hard to remove. Wherever possible the walls of the pasteurizer should be cooled at the end of the holding period by circulating cold water through the coil or jacket to prevent a thin film of milk being exposed on a hot surface. When this is done, it is usually a simple matter to keep a pasteurizer clean by rinsing it thoroughly with cold water and washing it with ordinary washing powders. It is fairly certain that sur-

faces which cannot be easily cleaned will not always be properly cleaned. Every effort should be made to see that equipment is so constructed, located, and operated as to make cleaning simple and easy.

The determination of the efficiency of sterilization presents a more difficult problem, as it is necessary to go beyond an ordinary physical examination of the sterilized surfaces. Heat treatment by steam, hot water, or moist hot air has been the most common means of sterilization in commercial use. Chemical treatment by solution containing chlorine is now used quite commonly. It has been fairly well established that the exposure of surfaces to certain degrees of heat for certain periods of time will accomplish sterilization, and also that exposure to certain concentrations of certain chemical for definite periods of time will also give satisfactory results. Attempts have been made with more or less success to determine the efficiency of sterilization by taking temperatures, by observing the length of time of application of such temperatures, and by testing the strength of chemical solutions and noting the time of application. The results have not been entirely satisfactory and it has not been easy to convince plant operators that these requirements must be met in order to get results.

More recently a more definite method of determining efficiency of sterilization has been brought into use. The supposedly sterilized container or piece of equipment is rinsed with an aliquot portion of sterilized water and standard plate counts are made to give an approximation of the number of colony-producing bacteria rinsed from the container or piece of equipment. This method has been used in a number of places and has made it easier to convince plant owners that they are not securing sterilization when they are confronted with unsatisfactory results of tests of this kind. As an illustration of the type of information that can be obtained, the following results of a series of tests made by a state health department are submitted. These results include the examination of bottles and cans from 526 plants in 179 municipalities during a period of about 2 years. Of 1,820 bottles examined 412, or 22.6 per cent, gave counts in excess of 10 per milliliter of capacity and 784, or 43.1 per cent, gave counts in excess of 1 per ml. Of 1,193 milk cans examined 527, or 44.2 per cent, gave counts in excess of 10 per ml. of capacity of such cans and

744, or 62.3 per cent, gave counts in excess of 1 per ml. capacity.

The International Association of Milk Dealers describes a method of this kind on pages 72 and 73 of its Laboratory Manual. It is understood that it is proposed to include this method in the next revision of Standard Methods of Milk Analysis. The standard adopted by the Milk Dealers Association for the satisfactory sterilization of bottles is that they shall give counts of not more than 2 colonies per c.c. capacity and for cans and covers not more than 100,000 colonies per 10-gal. can. The standards adopted by some health departments are more rigid. A standard adopted by one department provides for not more than 1 colony per ml. capacity of the containers, whether bottle or can.

The results given above indicate that 56.9 per cent
2566 of the bottles examined and 37.7 per cent of the cans examined complied with the latter standard. This would indicate that the standard is a reasonable one, inasmuch as the results given have been reported as a first attempt to check the efficiency of sterilization by this method in these plants. It is reasonable to expect that a re-survey would indicate a higher percentage compliance.

The committee is inclined to believe that the question as to whether this or any other standard of sterilization is too rigid or perhaps not rigid enough has not been answered satisfactorily and that the problem should be studied fundamentally.

Conclusions And Recommendations

It appears from the studies that:

1. At the present time the best method available for determining the efficiency of cleaning is a physical examination of the surfaces cleaned which should be made while the equipment is completely dismantled.

2. The most satisfactory way now available to determine the efficiency of sterilization is by rinsing the sterilized surfaces with sterile water and examining this water for bacteria by the Standard Plate Method.

3. In view of the possible inadequacy of present standards based on this method the committees recommend that intensive research work upon the problem be conducted in order that definite and practicable standards may be estab-

lished for the sterilization of milk containers and equipment.

Second Conference on Sanitation of Paper Milk Containers Reported by Dr. R. S. Breed, Chairman, With a Supplementary Note on Sanitary Inspection and Control at Pulp Paper Mills.

New York Agricultural Experiment Station
Geneva, New York, May 2, 1938.

As a result of rapid and interesting developments in the use of paper milk containers during the past year, it was considered advisable to hold a second conference to discuss problems of sanitation involved in the manufacture and use of single service paper containers for milk and cream. This meeting took place on May 2nd, 1938, at the New York Agricultural Experiment Station, Geneva, New York. A report of progress made during the year was given by Dr. J. R. Sanborn of the Geneva Experiment Station. Statements pertaining to various aspects of the work were made by Dr. John W. Rice of Bucknell University who is to be associated during the summer months with Dr. Sanborn in research work at the Geneva Station, Mr. J. C. Marquardt

* A member of the committee until he resigned as Chief Public Health Engineer of the State Board of Health of Missouri on May 10, 1933.

of the Geneva Station, Dr. F. W. Tanner of the University of Illinois, Urbana, Illinois, Mr. S. Abraham in charge of milk inspection work for New York City and Mr. W. D. Tiedeman, Chief of the Bureau of Sanitation of the New York State Department of Health.

About one hundred persons attended the conference, representing the following manufacturers of paper containers, American Can Company, Bensel Corporation, Dixie-Vortex Company, Ex-Cell-O Corporation, the Lily-Tulip Cup Corporation, Mono Service Company, the Reed Container Company and the Sealright Company; also manufacturers of paper board used in making these containers; makers of milk bottle caps, paper cups, secretaries of interested paper, pulp and container associations, milk dealers using paper containers, dairy machinery manufacturers, and representatives from federal, state and municipal health groups. The purpose of the conference was to encourage a free discussion between responsible health authorities and representatives of the industry, in order that both satisfactory and unsatisfactory practices in the handling and use of containers of this type would be revealed, and that plans could be made for correcting any undesirable conditions that have developed during the rapid introduction of these containers, particularly in the metropolitan area of New York City.

Health authorities were requested to state clearly what precautions they felt should be taken in the manufacture and use of containers of this type. Dr. Sanborn reported that through the development of a disintegration technic, he had been able to make between 500 and 1,000 bacteriological analyses of samples of paper board, the histories of which were known. All mills manufacturing board for milk containers use virgin mechanical or chemical pulp. Processes of manufacture when this work started were found to yield a board which gave an average bacterial count of less than 500 colonies per gram of disintegrated paper. In following the production of six mills in a routine way during the period from May 1937 to April 1938, it was found that two of the mills were able to keep nearly all counts under 100 colonies per gram, and samples were often practically bacteria free. There is some indication that board made during the spring and fall may show higher counts due to the fact that control of microorganisms in water supplies and in mill systems may be less effective then than at other times in the year. However,

these data are not yet sufficient to reveal what can be accomplished when the various mills give attention to the matter of producing consistently a low count paper board. Dr. Sanborn stated that some mills are not in a position to guarantee a paper board that will regularly yield bacteriological counts of less than 500 per gram.

The persons present at the May second conference appreciated the desirability of holding to a minimum all human contact with paper and containers until the finished container filled with milk reaches the consumer. Various reports indicated that definite progress is being made along these lines. It was evident that manufacturers realize the importance of handling the paper, paper blanks, and finished containers as aseptically as possible. They also realize the value of packing pre-fabricated containers in such a way that the milk dealer who receives them will regard the containers as sterilized packages. Careless handling and misuse of paper blanks and fabricated containers in milk bottling plants were reported by the health authorities present. Suggestions were made pertaining to the sterilization of containers just before filling with milk. The use of toxic substances of any sort in the paper, moisture-proofing materials, adhesives, or other materials used in the manufacture of the container could not be allowed under any circumstances.

The conference again brought out differences in viewpoint among public health authorities as to methods of achieving the highest possible sanitary quality in both prefabricated containers and those that are filled with milk immediately after paraffining. There are so many mechanical and sanitary difficulties involved in providing sterile containers in milk plants that health authorities are requiring that more careful attention be paid to sanitary conditions involving the storage, handling, and filling of containers in the average milk plant.

As a result of suggestions that have been received during the year, mimeographed sheets were prepared suggesting amendments to the Principles of Sanitation which were drawn up at the previous conference held on July 12, 1937.[1] Preliminary drafts of a model ordinance for cities were distributed for discussion.

Those interested may secure copies of the various publications and mimeographed sheets that were available at

1. Report of Proceedings published in The Milk Sanitarians, 6, No. 9, September 1937.

the meeting, on application to the Geneva Experiment Station.

Supplementary Note on Sanitary Inspection and Control at Pulp and Paper Mills.

In response to a general request from health groups represented at the second conference on paper milk containers that some sort of an official inspection be established of mills making board for food containers, the technical directors from a number of interested mills met at the New York State Agricultural Experiment Station on May 16, 1938, to consider a program for meeting sanitary requirements. The paper manufacturers present re-
2568 quested sanitary inspection of their mills and authorized Dr. R. S. Breed and Dr. J. R. Sanborn to organize and conduct a preliminary program of inspection and control. A group of about a dozen mills have requested that Dr. Sanborn undertake a preliminary inspection to determine how adequately they are prepared to meet the type of regulation that was suggested at the conference of May 2, 1938. The suggestions covered general sanitation at these pulp and paper mills, including control measures that would keep persons suffering from contagious diseases from contact with paper-making operations; proper purification of water supplies; and handling of pulp and paper so as to maintain low bacterial counts in the pulp before it reaches the drier rolls and in the finished product.

The purpose of these preliminuary inspections is to insure the production of paper that is sufficiently bacteria-free and clean to meet the rigid requirements necessary for the packaging of perishable foods. These procedures, incidentally, are also helpful in general mill operation and production. Inspections are based upon a guide for a systematic sanitary survey, tentatively approved by the pulp and paper and public health groups.

In several cases, the present summer inspection will follow up previous inspections made last year. Through the cooperation of mills that have had the opportunity to make improvements and corrections, it has been possible for this Station to secure complete records of the sanitary condition of milk container board production. Satisfactory bacteriological analysis of many samples of board has been made possible through the development at this Station of

a distintegration method previously described.[2] The technic for determining the bacterial content of container board consists of repulping the board in sterile water by means of a sterilized beating device (Fig. 1) and plating the resulting pulp suspension according to standard bacteriological procedures. Various cooperating laboratories are investigating the bacteriological contamination of paper board, using disintegration procedures. The results obtained are showing interesting correlations and considerable agreement.

Figure 1—Apparatus for Paper Board Disintegration

The entire procedure of paper disintegration for bacteriological examination is undergoing intensive investigation and standardization, so that conditions of sample collection and testing may be uniform at all laboratories. In disintegration processes, we are working toward the utilization of stainless steel equipment throughout. For example, in the case of the method previously described, sterile stainless steel covers for stainless steel churning jars have replaced the sterile, single service, paper board covers originally employed.

Pulp and paper mills are deriving considerable benefit from a knowledge of the bacterial content of various runs of board. This information enables a mill to meet sanitary requirements and to employ control measures effectively. Paper container manufacturers and public health laboratories are also finding disintegration methods useful in determining quality.

Paper Containers for Milk

Principles of Sanitation to be Observed in Their Manufacture and Use.*

Item I.

Paper Container Stock.

Containers shall be made from virgin chemical or mechanical pulp. Virgin pulp is pulp that has not previously been used for commercial purposes. Board prior to moisture-roofing shall not at any time have a count exceeding 500 colonies per gram of disintegrated board.**

Unless used immediately after manufacture, container board shall be wrapped, sealed and protected until used. When used, the outside sheet on rolls or the top and bottom sheets of sheeted stock shall be discarded in all cases.

---

* As revised at a Conference held at Geneva, N. Y., May 2, 1938. Originally prepared by J. R. Sanborn, M. W. Yale and R. S. Breed.

** Further research has shown that this is a feasible and rather lenient standard. Certainly, board should not give a count of more than 100 colonies per gram where milk or milk products come in direct contact with uncoated papers.

Public Health Reasons.

(a) The use of stock which has previously been used for commercial purposes (secondary stock, is not consistent with standards of food quality. Even if secondary pulp is completely sterilized during recovery, its miscellaneous content of foreign matter and dirt render it unsuitable for use in milk container stock.

(b) Contamination of rolls of paper, or sheeted stock occurs most readily at ends or on top or bottom sheets, hence the advisability of complete wrapping protection and sealing of these rolls or packs. Discarding the outside sheets of rolls or top and bottom sheets of sheeted stock, is a desirable precaution.

Satisfactory Compliance: For the above reasons, this item shall be deemed to have been satisfied when:

(a) Mills produce container board from virgin pulps.

(b) Mills require personal cleanliness among operators and consistently practice plant sanitation for the purpose of producing board low in dirt count and free from slime spots.

(c) Rolls or sheeted stock are wrapped immediately after manufacture in strong, clean wrappers, or utilized before there is opportunity for contamination from dust, dirt, or handling.

Item 2.

Process of Conversion—Where Stock Is Made Directly Into Containers.

When container board reaches conversion plant, it shall be considered that this paper has received a bactericidal treatment. All stock and containers shall be handled
2569 mechanically so far as possible. Following fabrication, until final sealing in milk plant, container surfaces with which milk or milk products come in contact shall be protected from contamination. This shall be done through the use of mechanical equipment, careful handling, sealed sanitary shipping cases, or a closure for each container.

Public Health Reasons: Human handling of container board increases opportunity for contamination which is reflected in the numbers and types of microorganisms pres-

ent in waxed containers. If stock in conversion and milk plants is not protected from contamination, the value of germicidal treatment and sanitary precautions at pulp and paper mills will be partly or entirely nullified. Moisture-proof treatment may not completely sterilize containers. The chief purpose of the latter treatment is to render containers uniformly non-absorbent. Fortunately the same process may act as a secondary line of defense against contamination with microorganisms.

Satisfactory Compliance: This item shall be deemed to have been satisfied when:

(a) Paper direct from pulp and paper mill is unwrapped in conversion plant close to mechanically-fed machine and sheets exposed to unavoidable manual contact are discarded.

(b) Entire conversion process, methods of packing and shipping are conducted in such manner as to protect container from contamination, particularly human contact contamination.

Item 3

Process of Conversion Where Container is Preformed in a Collapsed or Nested State Before Final Sealing

Throughout the processes of printing, folding, sealing, adhesive application, or packing prior to shipment to milk plant, all stock and containers shall, as far as feasible, be handled mechanically and be suitably wrapped or packaged before shipping.

Packaged container stock at milk plant shall be kept in a clean, dry place and opened only for immediate use. Where it is necessary to form or manipulate containers, all surfaces with which milk or milk products may come in contact, shall be protected from human handling.

Public Health Reasons: It is important that, during intermediate stages in conversion processes, manual contacts with container board be reduced to a minimum. In order to guard against promiscuous handling and exposure to dirt, it is advisable to keep board not in actual use, packaged and sealed. Fabrication, printing and sealing of containers should be conducted in such manner as to protect them from contamination.

Satisfactory Compliance: This item shall be deemed to have been satisfied when:

(a) Plants for printing, folding, sealing, and packing containers or other operations prior to delivery to milk plants, handle container board mechanically so far as possible and, at the conclusion of the operations, package the stock in suitable wrappers, cartons, or tubes.

(b) Milk plants protect packaged containers and contents from injury or abuse and complete fabrication, filling, and sealing of containers in such manner as to protect them from contamination.

Item 4

Moisture-Proofing

Moisture-proofing of containers shall be accomplished by means of fully refined paraffin wax or other suitable materials which are odorless, tasteless and non-toxic. The operation of paraffining machines shall be supervised by competent persons.

Public Health Reasons: Fully refined paraffin is the only grade acceptable to and consistent with food uses. It is of fundamental importance that containers be rendered completely non-absorbent by machines that operate properly and that the moisture-proofing material be odorless, tasteless and non-poisonous.

Satisfactory compliance. This item shall be deemed to have been satisfied if the purpose and quality of the treatment described above are strictly maintained.

Item 5

Adhesives

Container board should be sealed by means of non-fermentable adhesives, preferably synthetic thermoplastic materials. Adhesives having starchy or casein bases must resist decomposition, dissolution, and leaching, and not contaminate the contents of containers with microorganisms.

Public Health Reasons: Adhesives are as a class notoriously susceptible to decomposition by microor-

ganisms. Some of these highly perishable materials, such as animal glue, are obviously not suitable for use in food containers. A number of adhesives, represented by products employing starchy or casein bases, while ordinarily fermentable, may be produced in forms or grades which are non-odorous, resistant to moisture, and unsuitable for the development of microorganisms.

Satisfactory Compliance: In accord with the above account, this item shall be deemed to have been satisfied if:

(a) Rapidly drying adhesives having starchy or casein bases which resist fermentation are used to form liquid-tight joints; these adhesives do not contaminate containers with microorganisms.

(b) Adhesives employed be of synthetic thermoplastic types.

Item 6

Germicides

Germicidal and bacteriostatic agents that are toxic to human beings or that affect milk in any way, as in taste, odor or nutritional qualities shall not be used in board, adhesives, or moisture-proofing materials for milk containers.

Public Health Reasons: Substances introduced into materials of which containers are composed, which might conceivably exert preservative or antiseptic effects may affect the nutritional value of milk and be instrumental in producing off-flavors or odors. In some cases injurious effects on human beings from the use of such antiseptics have been demonstrated. It is necessary that substances of this class for use with containers be free of any toxic associations.

Satisfactory Compliance: This item shall be deemed to have been satisfied when:

(a) No germicidal or bacteriostatic agents are used unless they have been shown to be non-toxic and without effect on milk through the use of physical, chemical and biological tests, supported by clinical evidence.

Item 7

Handling of Paraffin

Paraffin in the solid state shall be shipped and stored in cool, clean, dry places, protected from dirt and isolated from odorous materials. Paraffin in the liquid state shall be kept, at all times, in clean and sanitary containers. Waxing machines and baths shall be cleaned at regular intervals unless cleaning devices such as continuous filtration, are employed. In no case shall freshly prepared, new paraffin be introduced into used paraffin which has become discolored, oxidized or dirty. Odorous substances such as ordinary kerosene and gasoline shall not be used on or about conversion machines.

Public Helath Reasons: Paraffin absorbs odors and for the sake of milk quality it is advisable that special storage facilities be provided, which will also protect wax from promiscuous handling and exposure to dirt.

Due to the susceptibility of heated paraffin to oxidation, a well-regulated program of paraffin utilization should be followed to avoid over-heating, prevent contamination of new paraffin with partly oxidized wax and to eliminate the possibility of coating or impregnation of containers with discolored, dirty or oxidized wax.

Satisfactory Compliance: This item shall be deemed to have been satisfied if:

(a) Slabs of paraffin are shipped and stored in clean, cool, dry places and removed from storage only as required for coating or impregnation bath.

(b) Paraffin for coating, impregnation or storage is held at temperatures and for periods of time which will not impart flavors or odors to paraffin or milk.

(c) Molten paraffin is held in clean sanitary containers.

(d) Paraffin bath or tank is cleaned by continuous filtration or at regular intervals depending on such evidences of deterioration as discoloration and presence of dirt or fiber.

(e) The possibility of mixing new paraffin with a product that is unfit for use is avoided.

Item 8

Shipping Cases and Storage for Containers*

Cases for shipping empty containers shall be constructed of board or wrapping designed to adequately protect containers from injury or abuse due to tearing or breaking. Containers shall be stored in sealed, dry, unbroken cases, in a dry, vermin-proof location. Partly empty ship-
2570 ping cases of prefabricated containers shall be re-sealed, rewrapped, or otherwise protected from contamination during storage. Except during filling operations, empty containers shall not be exposed at any time.

Public Health Reasons: Damage to shipping cases frequently exposes containers to conditions which may result in serious contamination from dirt, wetting and human contact.

Satisfactory Compliance: This item shall be deemed to have been satisfied when:

(a) Shipping cases are well enough constructed and sealed to resist the handling they receive in transit without injury.

(b) Containers are stored at all times in sealed cases in places having dry floors and where there is no washing down of the floors while cartons are in storage.

Item 9

Cartons for Shipping Filled Containers

Only clean cartons shall be used for shipping filled containers. Returned carriers shall be handled or stored so as not to become wet, dirty, or damaged before again being used.

Public Health Reasons: The re-use of shipping cartons may easily become a menace to milk quality and health. The abuse of these boxes arises from lack of care in handling and storing returned cartons. They may be carelessly thrown aside, allowed to become wet, dirty and mildewed. The packing of new containers of fresh milk

*Regulations governing construction of milk plants so as to limit the operations of opening shipping cases, storing, and filling the containers to definite rooms, should be adopted where feasible.

in abused cartons is a practice which should not be allowed as it may cause addition of organisms and dirt.

Satisfactory Compliance: This item shall be deemed to have been satisfied when:

(a) New paper cartons are used for single delivery to retailer.

(b) Milk plant has adequate and dry storage facilities for returned cartons and uses only neat and clean, uninjured boxes.

Item 10

Examination of Containers

By any method of manufacture, treatment, or handling employed, the final test of sterility and cleanliness shall be freedom from bacteria, chemical reagents, and other foreign matter.

Public Health Reasons: Consideration of possible sources of contamination during container manufacture, renders it advisable to reduce to a minimum the number of organisms present. While the likelihood of contamination by disease organisms is slight, bacteriological control of plant sanitation is necessary.

Satisfactory Compliance: This item shall be deemed to have been satisfied when:

(a) The average bacterial content of containers does not exceed 50 colonies per container.

Item 11

Quarantined Residences

The delivery of milk or milk products to and the collection of milk and milk-products containers from quarantined residences shall be subject to the special requirements of the health officer. It is recommended and urged that single service containers be used for retail delivery of milk and milk products under these circumstances. In case of wholesale delivery, to hospitals, etc., caring for infectious diseases carrier cartons as well as individual containers should be destroyed.

Sanitation of Paper Containers and Fibre Products

One of the weak links in the sanitary handling of dairy products has been the condition of bottle caps, cover hoods, milk containers, and cartons for ice cream, butter, and cheese. Some of these come into immediate contact with the food product, and others purport to protect it from contamination. In spite of the great care and expense involved in securing milk from healthy cows, and in pasteurizing it under scientific control by operators free from communicable disease, it has been common practice to use milk caps of uncertain sanitary history, to say the least. Pouring lips of glass milk bottles are protected by paper devices of one kind or another whose sanitary history is nondescript. The same considerations obtain in the increasing use of fibre containers for ice cream, both retail and wholesale.

It is common knowledge that paper and other fibre products have not been manufactured under such excellent sanitary conditions as usually obtain in food handling operations. Direct contact of high quality dairy products with containers of high, low, and indifferent degrees of cleanliness is as incongruous as the hand capping of milk bottles or the dispensing of ice cream under the faulty conditions of sanitation which obtains at many fountains. The effects of expensive and careful processing are weakened or possibly nullified by such practices.

These conditions are being studied and remedies devised by the extensive researches now being conducted at the New York State Agricultural Experiment Station at Geneva. Methods have been reported for determining the bacterial content of fibre products. Sanitary standards are being developed to guide the operations of the mills. Suggested regulations have been drawn up and offered as a tentative control procedure to protect the public and the industry from hasty and ill-considered official regulatory measures. An educational program has been inaugurated to demonstrate to the mills what constitutes sanitation according to the standards of public health officials and of the dairy industry. Pulp and paper mills are being inspected and rated for sanitary conditions and methods. A list of those having approved ratings will be published later when all have had an opportunity to make necessary improvements and corrections. This is a valuable contribution to dairy technology and sanitation.

Some mills are now producing high quality products. Their operations are open for sanitary inspection. Others are not operating on this basis. Why are they not? One answer is not new; they have a market for their products which are being produced as heretofore, and as yet are not prepared to go to the expense necessary to make their operations comply with the modern conceptions of sanitation. In some cases, they have not realized that conditions which may be satisfactory for routine paper production will not always meet sanitary standards which must be maintained for food and dairy containers.

The health officer, the conscientious dealer, and the consuming public have a right to know what makes of paper wrappers and containers, commensurate in sanitary quality to milk and ice cream, are available. Obviously, reliance cannot be placed on the claims of salesmen. Inspection by an impartial agency, which is authorized to certify to compliance, and to publish the names of such brands, would meet the need. Firms which are now producing high quality products should be known by this fact, and not be made to wait for some indefinite time in the future when the laggards can be listed at the same time as the pioneers.

Plaintiff's Exhibit No. 20 omitted at this point as it appears as a part of Plaintiff's Exhibit No. 4.

2575 PLAINTIFF'S EXHIBIT NO. 21.

Proposed Standards for Paper Milk Containers.

J. R. Sanborn
New York Agricultural Experiment Station,

Geneva, New York.

Sanitary Requirements of Food Container Board.

There is no reason why a paper container made from clean, sound, pulp wood according to methods consistent with food standards should not be hygienically suitable for perishable foods. Investigation has demonstrated the feasibility and effectiveness of this means of packaging milk.

Commercial mill practices in manufacturing pulp and paper and the condition of finished products are often not sufficiently sanitary to meet with the approval of food sanitarians and public health officials. The paper maker needs a sanitary technique comparable to the procedures employed for edible products. The intimate associations of cellulose material with food and household uses admit of no compromise with cleanliness and microbiological control.

Fear of increased operative costs and hesitancy to make changes from long established practices intensify the opposition to improved sanitary methods on the part of some pulp and paper mills. On the other hand, several producers of food wrappers and container board already exercise effective sanitary control which enables them to manufacture a clean, high quality product practically free from microorganisms. By insuring purity of process water, cleanliness of mill systems and operations, and adequate protection of the finished product, these plants are setting a standard of quality which indicates the suitability
2576 and safety of properly made paper for the packaging of perishable and easily contaminated food products such as milk.

Consistently high standards of quality in paper mill operations and possible approval by public health officials will depend on constant adherence to a program of microbiological control. The industry has suggested that sanitary inspections be made of plants manufacturing milk container board. Apparently the only way this can be done is by federal supervision or voluntary action on the part of pulp and paper mills or conversion plants. Many purchasers and consumers of paper food containers are sensitive to the bacterial counts of contained foods and to the presence of undesirable organisms. With all the cleanliness and care used in preparing and processing foods, it is obviously inconsistent to package these foods in unsuitable and contaminated paper.

Sanitary Quality of Paper Milk Containers.

An institute has been established at the New York State Agricultural Experiment Station for the purpose of securing fundamental information on the sanitary condition of paper for use in contact with such perishable foods as milk

and milk products, and establishing standards for this paper and its fabricated forms which will provide health laboratories with criteria for estimating sanitary quality in paper containers.

During this investigation consideration has been given to certain principles of sanitation which should be observed in the manufacture and use of paper milk containers. The following items present in concise form some of the factors involved:

1. Use of virgin pulp only.
2577 2. Pure process water and strict microbiological control at pulp and paper mills.
3. Suitable protection and wrapping of finished board.
4. Mechanical handling of board and containers at conversion factories and milk plants.
5. Protection of board, adhesives, moisture-proofing materials, and finished containers from careless exposure to human contact, contamination, dirt, flushing water, or insects.
6. Detailed knowledge and careful selection of all materials composing the container to avoid the possibility of incorporating substances having germicidal or bacteriostatic effects, the use of which is prohibited unless they have been shown to be nontoxic to human beings and without effect on milk.

The bacteriological condition of the original container board usually influences directly the bacterial counts of finished containers. Strictly sanitary methods of handling, conveying, and storing good quality board aid in preserving its sanitary condition. Health laboratories are therefore primarily interested in the hygienic state of the original container board as it is received by conversion factories or milk plants.

Municipal Regulations and Control.

Critical examination of food wrapper and container board will reveal information relative to the care and sanitary precautions taken by pulp and paper mills in the manufacture of these important grades of paper. Health laboratories may confirm by identification of fibers the nature of the pulp used; calculate the dirt content according to a method of numerical estimation suggested by the pulp

Testing Committee of the Technical Association of the Pulp and Paper Industry; examine slime spots for
2578 evidences of slime-forming organisms, growth fragments, or characteristic products of slime production.

Appreciable quantities of dirt and foreign matter may be introduced into new paper and board during their manufacture. Particles of metal, pipe scale, sand, and carbonaceous matter sometimes occur as well as various foreign fibers and organic residues, the presence of which is occasionally associated with unhygienic or careless practices.

Accumulations of microbial growth or slimes in pipe lines, chests and tanks are frequently dislodged and carried along by pulp streams to paper machines where considerable operative difficulties may result. Slimes are caused by bacteria, filamentous fungi, or yeastlike organisms, representative species falling under the genera Aerobacter, Achromobacter, Flavobacterium, Pseudomonas, Bacillus, Penicillium, Mucor, Aspergillus, Cladosporium, Trichoderma, Oidium, Monilia. The presence of slime spots in samples of paper suggests inadequate control over the development of micro-organisms in pulp and paper mills. Many slime-forming species are unusually aggressive and persistent, controllable only by specific remedial measures and consistent application of programs of slime eradication and prevention. Only those mills which successfully control micro-organisms within their systems should be considered by health officials for an approved sanitary status in the manufacture of food wrappers and containers.

It is also possible to grade paper products such as milk container board according to their bacterial content based on the number of colonies developing on standard agar per gram of disintegrated stock. Disintegration of con-
2579 tainer board may be accomplished aseptically by means of special beaters, shredders, grinders, or agitators. When properly carried out the process is completed in a relatively short time. Ten cc. portions of the pulp suspensions containing ten grams of board to a liter of sterile water, are plated out on standard agar in both 100 mm. and 150 mm. petri dishes. In the case of the regular size plates, 2 cc. amounts of suspension are introduced into each dish, thereby facilitating the counting of colonies from board containing relatively large numbers of organisms. The large size plates, accommodating the entire 10 cc. portion of pulp suspension, furnish the more useful

method for the examination of improved milk container stock.

Samples of container board taken at any state prior to moisture-proofing should not have a count exceeding 500 colonies per gram of disintegrated board. Certain pulp and paper mills which are able to maintain effective control over the development of micro-organisms within their systems, manufacture a product having counts of less than 100 per gram. Ten cc. rinses of paraffined containers made from low count board are often practically free from bacteria. On the other hand, containers produced from board which approaches the maximum count of 500 may yield 100 colonies per container. Average plate counts for all types of paper milk containers are usually less than 50 per container, which is standard for the Baltimore regulation discussed below.

Rinse tests on fabricated containers are made in conformity with the latest standard methods recommended by the American Public Health Association. Paper con-
2580 tainers are rinsed with 10 cc. of sterile water all of which is plated out on standard agar, by distributing the rinse among three regular size plates or introducing the entire quantity into a 150 mm. dish. Plates are incubated at 37° C., and counts are made at the end of 48 and 72 hours. It may be considered that present standards for paper containers should be in accord with those suggested by the American Public Health Association for glass bottles. Sanitary conditions in pulp and paper mills, container manufacturing plants and dairies usually enable paper containers to meet a much stricter standard than those ordinarily considered for glass.

Isolated attempts are being made by control officials to regulate the handling and sale of milk and milk products packaged in paper. While these actions are based on information available at the time of formulation, recent findings indicate that the data are usually inadequate. The regulation adopted by the Baltimore City Health Department is deserving of serious study. In accord with this regulation it will be generally agreed that all paper, cardboard or other non-glass containers should be approved by the Commissioner of Health and conform to certain general rules regarding labelling and designation. Item 4 of the more technical portion of the regulation states:

"The paper blanks or non-paraffined containers shall be

received by the milk plant in tightly closed packages or cartons and shall be manufactured from the best obtainable white spruce pulp or other material approved by the Commissioner of Health."

In the light of the results of recent investigations, this item may be effectively amended according to the suggestion given below:

"Container board in rolls, sheeted stock or blanks shall be received by conversion or milk plants suitably
2581 wrapped and sealed, and shall, until used, be kept unopened, in a clean, dry place."

"Only virgin pulp shall be used in manufacturing milk container board, which is low in dirt count, free from slime spots and has a bacterial count which does not, at any time, exceed 500 colonies per gram of disintegrated board."

Item 5 of the Baltimore regulations makes the following statement:

"The container, if glued, shall be glued with material made from a base of soybean, tapioca, or other produced approved by the Commissioner of Health."

The suggested revision of this item would be as follows:

"The gluing of the container shall be accomplished with non-fermentable adhesives of synthetic, thermoplastic, varieties, or such types having vegetable or casein bases as produce rapidly-drying films which resist dissolution, decomposition and leaching."

Item 6 of the Baltimore ruling is as follows:

"The container, if it be one which requires paraffining, shall be paraffined in the milk plant where it is filled with milk or milk products; and shall be mechanically conveyed from the paraffining apparatus to the filling and sealing equipment; and the paraffining, conveying, filling and sealing of all containers shall be so accomplished as to prevent any possible hand or other contamination."

In view of the fact that paraffining may not completely sterilize containers and that premade containers may be as effectively protected from contamination as those that are filled with the milk immediately after paraffining, both types of containers should be permitted. The condition of paper milk containers in actual use at milk plants is the most reliable index to their sanitary quality. Wording
2582 such as the following might be substituted.

"Moisture-proofing of containers shall be accomplished by means of fully refined paraffin wax or other

suitable materials which are odorless, tasteless, and non-toxic. The operation of paraffining machines shall be supervised by competent mechanics.

"All stock and containers shall be handled mechanically so far as possible and be paraffined, conveyed, filled and sealed so as to prevent contamination from manual contact, dirt, and insects."

This form of amended regulation would seem to provide sufficient restriction and sanitary control without shutting out high quality containers which may reach milk plants already paraffined. It has been demonstrated that it is entirely possible to make paper wrappers and containers which are suitable for milk and other perishable foods. As manufacturers continue to progress in sanitary methods of production and handling, it is probable that standards and specifications will become more stringent.

2583 PLAINTIFF'S EXHIBIT NO. 22.

Sanitary Problems in Connection With Paper Containers for Milk.

J. R. Sanborn,
New York Agricultural Experiment Station,
Geneva, New York.

Recent Developments in the Single-Service Paper Container.

Paper wrappers and containers used in direct contact with perishable foods are undergoing critical sanitary investigation. Various research groups have long been appreciative of the need for the establishment of sanitary standards for paper packaging materials. The coming of the paper container for milk provided the impetus necessary to bring about fundamental improvements in the sanitary quality of container board. With the cooperation of pulp and paper mills, conversion factories and milk plants, a sanitary technique has been adopted which has already resulted in significant improvements in the hygienic condition of food paper containers.

While developments in the paper milk container industry during the past two years have been phenomenal, its history in this country goes back many years. In-

vestigations reveal the extensive background of experience and research on which manufacturers are able to base advances in paper container engineering and sanitation.

New York City has known this container for approximately ten years. Since 1933 the amount of milk sold in paper containers has steadily increased. Besides the cities of the New York area and New Jersey, paper containers for milk are being used in Philadelphia, Pa., Baltimore, Md., Cleveland, Ohio, Detroit, Mich., St.
2584 Louis, Mo., Seattle, Wash., Los Angeles, Cal., Toledo, Ohio, Atlanta, Ga., Dayton, Ohio, Santa Barbara, Cal., San Francisco, Cal., Pittsburgh, Pa., Phoenix, Ariz., Wichita, Kansas, Omaha, Nebraska, and Dallas, Texas.

Last Spring the Department of Health in New York City reported that about one-fourth of the packaged milk and cream supply of that City was furnished in paper. A single milk plant, which last March turned out 160,000 to 180,000 paper packages of milk daily had increased its output in June to over 250,000 packages. Plants that have used both paper containers and glass bottles state that there is every indication that milk packaged in paper is, in all respects, the equal of glass bottled milk.

Public health agencies are availing themselves more and more of the benefits which may be derived from the use of single service containers. In cases of infectious disease, delivery of milk in paper containers is an important factor in control. There are indications that this means of distributing milk may decrease incidence of contagious disease during epidemics. The use of single service containers for milk by quarantined residences, hospitals, and other institutions caring for infectious diseases, is recommended and urged.

The possibilities for greater sanitary usefulness of paper packaging for milk and other perishable foods are receiving the detailed consideration of public health authorities. Several pulp and paper mills are endeavoring to meet certain prescribed sanitary requirements and to achieve as closely as possible a bacteria-free board for milk containers. Their success in the attainment of this goal will depend upon the application of a program
2585 of strict microbiological control based on the utilization of pure process water, specific bactericidal treatments, practical mill sanitation, and proper protec-

tion of finished paper. Following these procedures, some mills are manufacturing, with reasonable consistency, milk container board which yields low bacterial counts. Other plants, engaged in solving specific problems are making definite progress toward effective microbiological control.

Tentative and Proposed Standards for Regulation and Control.

In view of the fact that the sanitary condition of paper board is of fundamental importance in the manufacture of sanitary containers, definite specifications are being worked out for milk container board. It is essential that only virgin pulp from clean, sound wood be employed. Under careful conditions of manufacture, board may be produced which contains considerably less than 500 colonies per gram of disintegrated stock. This count has been suggested as a reasonable maximum and until the effects on board counts of seasonal variations in water supplies, temperatures and microbiological development have been determined, we feel it to be inadvisable to specify a more exacting standard. Meanwhile, mills producing this board are doing their utmost to maintain the lowest possible counts. Several of them are making board which yields consistently less than 250 colonies per gram. In a few cases, where unusually careful attention is paid to microbiological control, counts may be periodically less than 100, even approaching the bacteria-free state. The results shown below indicate the trend of the board investigation at four represenative mills.

2586 TABLE I.—SUMMARY OF RESULTS ON BOARD TESTS.

Tests	Mill A	Mill B	Mill C	Mill D
Number of Tests	24	25	49	28
Number Counts under 100	8	3	34	20
Number Counts under 200	17	7	45	24
Counts under 250 in Per cent	83	40	96	94

A detailed study is also being made of the type if micro-organisms found in milk container board. The predominating species are typically heat-resistant, including spore-forming bacteria, micrococci, actinomyces, and various groups of fungi. The origin and characteristics of

these species are worth consideration in their relation to the quality of the milk that is to be placed in the containers.

The action of heat resistant organisms on milk is well known, and in view of the fact, however, that bacteria normally found in milk tend to outgrow nearly all of the paper container types, casual contamination from the container does not appear to be significant.

It has been conclusively demonstrated that low count board, properly handled produces containers having low bacterial counts. Thus far there have been considerable variations in board counts and in results of rinse tests made from fabricated containers. On the other hand, while occasional rinses may reveal high numbers, the average of many tests shows that all of the generally used types of paper milk containers yield counts of less than 50 per container. These figures are, of course, much less than those suggested by the American Public
2587 Health Association in the Standard Methods of Milk Analysis report for glass bottles. Low rinse counts on paper containers known to be made from sanitary board, are indicative of the bacteriological condition of containers. Without intimate knowledge and control of boards used, results of rinse tests may be inconsistent and misleading. Recent findings indicate that there is now far less variation in board counts among mills exercising careful microbiological control than occurred prior to the adoption of the present program.

As far as moisture-proofing treatments are concerned, these procedures may not completely sterilize containers. Their chief purpose is to render paper containers uniformly non-absorbent. Fully refined paraffin fulfills satisfactorily certain general sanitary criteria but greater uniformity and efficiency should be obtained in waxing procedures. An efficient paraffining process also acts as a secondary line of defense against contamination with micro-organisms.

The use of germicidal and bacteriostatic agents in container materials, that are toxic to human being or that effect milk in any way, should be strictly prohibited. Substances which might conceivably exert germicidal or bacteriostatic activity must not be used unless they have been shown to be nontoxic and without effect on milk, through the use of physical, chemical, and biological tests, supported by clinical evidence.

Sanitary Production of Milk Container Board.

Sanitation in paper milk containers invariably goes back to the original board. Specifications for board should include, in addition to the exclusive use of virgin 2588 pulp, low bacterial counts, low dirt counts, and absence of slime spots. Slimes are accumulated microbiological growths occurring in pulp and paper mill systems. These organisms are usually heat-resistant, and hence, may persist through paper-making operations. The slime growths which build up are frequent causes of discolorations, objectionable odors and spotting in paper. The elimination of slime at its source by suitable bactericidal treatments is a necessary prerequisite to the production of board having satisfactory sanitary quality for milk containers. Some mills are taking voluntary action in this matter, requesting periodic inspections and plant tests as aids to consistent sanitary practicies and to the establishment of effective programs of microbiological control.

The following table presents a series of typical board counts obtained during recent tests using agar. These have been arranged, for the sake of clarity, in the order of decreasing magnitude. Incubation was at 32° C. for 3 days.

TABLE II.—BACTERIAL COLONIES PER GRAM OF DISINTEGRATED BOARD.

Tests	Mill A	Mill B	Mill C	Mill D
1	242	490	108	143
2	187	346	77	112
3	171	318	73	100
4	163	307	49	96
5	138	262	43	90
6	129	210	32	75
7	119	209	22	54
8	104	172	21	54
9	101	167	11	49
10	86	107	7	43
11	76	97	0	32
12	69	92	00	11

Eighty per cent of the tests in a series of 137 examinations representing seven pulp and paper mills, yielded counts of less than 250 colonies per gram of board.

2589 While the scope of this work has, thus far, been somewhat limited, later reports will provide more complete information.

Sanitary Production of Paper Milk Containers.

Sanitarily produced milk container board, properly handled, determines the sanitary condition of fabricated containers. Proper handling of uncontaminated paper includes:

1. Suitable protection of finished paper at mill with sanitary wrappings and sealing.
2. Discarding of top and bottom, or outside sheets at converting plants and mechanical handling so far as possible of stock and containers.
3. Prevention of contamination from manual contact, dirt, flushing water, and insects during container formation, moisture-proofing, conveying, filling, and sealing.
4. Adequate, dry, sanitary storage for paper products at milk plants and storage rooms.

The Institute of Research which has been established at the New York State Agricultural Experiment Station, maintains close contact with paper milk container sanitation at pulp and paper mills, converting factories, and milk plants, working in co-operation with manufacturers and public health officials toward the attainment and maintenance of high sanitary standards.

February 18, 1939.

Mr. J. M. S. Ewing,
Manager of Sales,
Cherry River Paper Company,
Pennsylvania Building,
Philadelphia, Pa.

Dear Mr. Ewing:

I submit, herewith, a report of the bacteriological analysis of milk container board, samples No. 3389-159, received from your mill on February 14, 1939.

This sample was collected by members of the mill laboratory under directions given by the Geneva laboratory. Standard nutrient agar was used in plating, and incubation was carried at 37° C. for 48 hours.

Cincinnati, Ohio
23 June, 1939

Messrs. Gariepy and Gariepy
One North LaSalle Street, Suite 1361
Chicago, Illinois

Gentlemen:

At your request we are setting forth the following description of formulations used in the printing of Dean Milk Company milk cartons. There were six (6) inks used in the printing of these cartons and the following shows the percentage of each ingredient and an explanation of each component.

As indicated in the following formulas, a printing ink consists of a dry color, that is a colored material which is insoluble in water, an extender, a white inert material also insoluble in water, a vehicle, which is in most cases a drying oil and consists of linseed oil, a wax, and a drier. The ingredients are stirred until the dry material is wetted with the vehicle and it is then run over an attrition mill to disperse the solids into the vehicle to a smooth, homogeneous mass. When printed, the vehicle oxidizes thus forming a hard, tough film which adheres to the paper because of the fact that while still wet it penetrates into the fiber and thus forms a closely knitted bond.

2624 Superlith:

Is a white inert, finely divided pigment made of 20% titanium dioxide and 80% lithophone, the lithophone being a mixture of barium sulphate and zinc sulphide. Is commonly used as an inert pigment in colors used on food cartons, wrappers, bags, etc.

Magnesium:

Ordinary magnesium carbonate. Is a white powder, chemically pure, edible, and is a pharmaceutical product.

Lithol Rubine:

An organic color which can be certified as a food color. It is an inert pigment which has been allowed as a food color when certified by the federal government. Insoluble in water and milk.

#55 Vehicle:

Made from pure linseed oil and a gum made by condensing rosin and glycerin, commonly called ester gum. The vehicle is a solution of the gum in the oil. Drying occurs by oxidation of the oil and the resulting tough, hard film is insoluble in water.

#3 Pale Linseed Vehicle:

Made from pure linseed oil by heating to 600 degrees F. for approximately two (2) hours, which thickens the oil. When used in an ink, it dries to a tough, hard film insoluble in water and milk.

Ceresine Wax:

A yellow-white, highly refined wax similar to paraffine in derivation and physical and chemical properties but harder. Like paraffine, it is insoluble in water and milk. Commonly used in inks for printing containers and wrappers for all kinds of food.

Driers:

A drier is a metallic linoleate. Its purpose in ink is to cause the vehicle to rapidly oxidize to a hard, tough film insoluble in water and paraffine. Without the drier the vehicle would remain wet indefinitely. Some driers are suitable for surface drying, others for body drying of the vehicle. Driers are made by the chemical reaction
2625 between metallic compounds like manganese, lead or cobalt, with linseed oil whereby there is produced a paste resembling mayonnaise in consistency, and which oxidizes to hard, tough film form. In both the paste and dried film form, the drier is insoluble in water and milk.

Driers are incorporated into inks to the extent of three or four per cent of the total weight of ink. The metallic content of driers is approximately 25 per cent the weight of drier.

Driers are a necessary component of all inks made from drying oils and are used on all types of food wrappers and packages.

Talc:

Ordinary triple-floated white talcum powder same as used in cosmetics.

#173 Red:

A calcium lithol. It is an inert pigment which has been allowed as a food color when certified by the federal government. This pigment is insoluble in milk and water.

#10-F-100 Red:

A barium lithol, same as #173 Red but of a different shade.

#475 Vehicle.

An alkyd resin made by condensing linseed oil with phthalic anhydride and glycerin. When this resin is dissolved in a drying oil such as linseed, it forms a hard film which is used in enamels and produces a very favorable vehicle for an ink which is on a food wrapper due to its high insolubility in liquids such as water and milk.

Medium Chrome Yellow:

An inorganic yellow pigment of a lead chromate constitution. This pigment is highly insoluble in water and milk and when ground into a vehicle forms a hard film highly insoluble in water. Has long been used in making inks for food cartons, wrappers and bags.

#120 Red:

Sodium lithol, same as #173 Red and 10-F-100 Red but of a different shade.

2626 #1307 Carbon Black:

Ordinary gas black. To produce, illuminating gas is burned with a deficiency of oxygen and the resulting pure carbon is collected on cold plates. This material is highly insoluble in any liquid.

#102 Barium Lithol Red:

Same as #173 Red except different shade.

#622 Compound:

Made from a mineral wax and linseed oil, the mineral wax being a highly refined paraffine wax.

#457 Vehicle:

The same constitution and properties as #475 Vehicle, the only difference being in viscosity.

#1666 Orange:

A pigment which can be certified as a food color. This color is insoluble in water and milk and differs from the lithols slightly.

#120364 Barium Lithol:

Same as 10-F-100.

#11356 Yellow:

Same as Medium Chrome Yellow.

#1575 White:

Magnesium carbonate, described before, is ground with linseed oil to form this basic white. It is used to cut the color strength of the inks.

#1508:

Titanium dioxide plus linseed oil. Titanium dioxide is a pure white oxide of titanium metal. It is highly inert and is used to form tints for printing inks. Not soluble in water or milk.

#10511 Blue:

Organic blue lake plus linseed oil. Blue lake is made by making a blue water-soluble dyestuff insoluble thus forming a pigment which is insoluble in water and milk and can be readily dispersed in a linseed oil.

#11347 Yellow:

Chrome yellow plus linseed oil. The chrome yellow in this material is the same as above described except that it has been ground into a linseed oil to form a base color.

#11356 Yellow:

Same as #11346 except a deeper shade, the chemical and physical properties being the same.

2627 #10037 Bronze Blue:

Iron blue plus linseed oil. Iron blue is a complex inorganic compound which has been used in the printing ink industry for many years. It is insoluble in water and milk and is used for the printing of food wrappers, cartons and bags.

#17294 Green:

An organic green lake plus linseed oil. This is an organic lake insoluble in water made from a green dyestuff which was originally soluble in water and milk, plus linseed oil.

Dextrine:

Edible sugar, used in candies and foods.

All of these inks dry to a hard film and are insoluble in any of the ingredients which are found in milk, even before the paraffine coating is applied. They are made up in accordance with accepted procedures and with raw materials commonly used in the manufacture of offset and lithographic inks.

Yours very truly,
The Hilton-Davis Chemical Company,
By: L. A. Hoffman,
Vice President.

LAHoffman

2633 **PLAINTIFF'S EXHIBIT NO. 50.**

Study on the Bacteriological Condition of the Paraffine Path in Pure-Pak Machine.

Place: Fieldcrest Dairy, Chemung, Illinois. Time: March 24, 1939.

Machine: Pure-Pak.

Temperature of Paraffine: 170° F.

Plan of the Study: During the operation of the machine while about 2,000 containers were being filled with milk, samples of the paraffine from the paraffine well were taken for bacteriological test.

The test consisted of: (1) agar plate, (2) agar tube. The paraffine samples were taken from the well, at intervals, by means of 10 cc. pipettes. Each sample consisted of 5 cc. of the paraffine. The paraffine was dropped in plates and warm agar was poured in for inoculation of the tubes, the paraffine was dropped in the tube in warm agar and this was shaken.

Table I.

Sample	Time Taken	No. of colonies on plates	Growth in Tubes	Remarks
1	11:50	0	0	At start
2	12:00	0	0	After whipping cream bottling
3	12:05	0	0	Before coffee cream bottling
4	12:15	0	0	After ½ pint cream bottled
5	12:30	0	0	After all cream bottled
6	12:50	0	0	Before milk bottling—slab of paraffine added.
7	1:05	0	0	15 minutes bottling milk
8	1:25	0	0	30 minutes bottling milk
	1:30			Slab of paraffine added
9	1:40	0	0	45 minutes bottling
10	1:55	0	0	60 minutes bottling—slab of paraffine added.
11	2:05	0	0	Bottling finished
12	2:05		+	Sample from train poked open
13	2:05		0	with a nail.

The test was repeated on March 26, Sunday.

The test was modified—Agar plates were prepared by pouring about 10 cc. of the paraffine in the plates, covering the whole bottom. Then nutrient agar was poured in and on the agar.

Nutrient broth in test tubes was inoculated by pouring in about 5 cc. of the paraffine.

Large test tubes were prepared by putting in each tube about 10 cc. of the paraffine and then rolling the tubes so that the paraffine covered most of the inside surface. After hardening, broth was poured in. These cultures were incubated at 90° F. for several days. Results are given in Table II.

2634

Sample	Time Taken	No. of Colonies	Agar Plate Counts	Large Tubes	Small Tubes	Remarks
1	11:20	0	0	0	000	Before bottling started
2	12:00	0	3	0	000	End of whipping cream bottling
3	12:25	0	1	0	000	End of coffee cream ½ pint bottling
4	12:45	0	0	0	000	End of qt. coffee cream bottling
5	1:00	0	0	0	000	15 minutes of milk bottling
6	1:16	0	0	0	00+	30 minutes of milk bottling
7	1:40	0	1	0	000	55 minutes of milk bottling
8	1:52	0	0	0	000	67 minutes of milk bottling
9	2:18	0	0	0	000	End of bottling

0 = no growth.
+ = growth.

2635 PLAINTIFF'S EXHIBIT NO. 51.

Table 16—Bactericidal Property of Paraffining.

Paper board plaques 2"x4½" were inoculated by being dipped in B. prodigiosus suspension and then paraffined at 170° F. for 15 seconds. As soon as paraffine coating hardened, the plaques were reduced to pulp in 200 ml. of water. Ten plates were poured each containing 2 ml. of the pulp mixture. In the table is given the number of colonies of B. prodigiosus that developed on each plate.

Abbreviations:

N = plaque not paraffined.
P = plaque paraffined.
W = plaque wet, not allowed to dry after being dipped in the suspension.
D = plaque dry, allowed to dry 30 minutes after being dipped in the suspension.
Ml = milliliter or cubic centimeter, about 20 drops.

Test 1 = Bacterial suspension used had a plate count of 2,120,000,000 per ml.

September 12, 1939

Mr. Owen Rall
Eckert & Peterson
135 South LaSalle Street
Chicago, Illinois

Dear Mr. Rall:

Receipt is acknowledged of your communication of September 8 with regard to regulations governing the manufacture and use of single-service containers for milk.

There is attached a copy of the regulations governing the manufacture, packing, transportation, and handling of single-service containers, milk bottle caps, and covers, as adopted by the Public Health Service Sanitation Advisory Board at its June, 1939 meeting.

The above regulations will appear in the forthcoming printed 1939 edition of the milk ordinance and code recommended by the Public Health Service for adoption by States and communities, which is expected to become available within the next two months. The printed 1939 edition will supersede and will contain some changes from the mimeographed 1939 edition, copy of which is enclosed.

Very truly yours,

A. W. Fuchs
A. W. Fuchs
Senior Sanitary Engineer for Chief,
Sanitation Section.

June 27, 1939

Public Health Service Sanitation Advisory Board Action on Single-Service Containers, Etc. at June 1939 Meeting.

The following sentence is to be added to items 10p and 12r of the forthcoming 1939 printed edition of the Public Health Service Milk Ordinance:

"The manufacture, packing, transportation, and handling of single-service containers and container caps and covers shall be conducted in a sanitary manner."

The following paragraph is to be added to Public Health Reason under items 10p and 12r:

"Single-service containers, etc. which have not been manufactured and handled in a sanitary manner may contaminate the milk."

The following material is to be added under Satisfactory Compliance of items 10p and 12r:

"(5) The manufacture, packing, transportation and handling of single-service containers and container caps and covers are conducted in accordance with the following requirements. Inspections required herein may be made by the health officer or by any agency authorized by him.

(a) The buildings and rooms in which single-service containers and container caps and covers are manufactured, packed, stored, and handled shall be clean, well lighted and ventilated, and free of dust and flies, as prescribed in items 1p, 2p, 3p, 4p, 6p, 7p, 8p, and 11p.

(b) The average bacterial plate count of the stock from which single-service containers and container caps and covers are made shall not exceed 100 colonies per gram. No substance shall be present in finished single-service

containers and container caps and covers which is toxic.

2650 (c) All operations at the fabrication plant and during transportation of the manufactured articles shall be so conducted as to reduce to a minimum the possibility of contaminating the manufactured articles, as prescribed in items 13p, 14p, and 15p.

(d) All of those parts of machinery and equipment with which the article being manufactured comes in contact shall be kept clean.

(e) All single-service containers and container caps and covers shall be so treated as to be as impervious to milk and milk products as practicable.

The porous condition of paraffined containers now available and the sloughing off of particles of paraffin into the product are undesirable, and manufacturers of single-service containers are urged to make every effort to provide a non-absorbent non-flaking surface.

(f) All single-service containers and container caps and covers shall prior to use be given bactericidal treatment equivalent to contact with paraffin for at least 30 seconds or at least 180° F.* in approved equipment operated in an approved manner. The bactericidal treatment equipment shall be provided with approved indicating and recording thermometers, and shall be so designed as automatically to insure the required temperature and contact time.

2651 PLAINTIFF'S EXHIBIT NO. 62.

Journal of Milk Technology

Sanitary Aspects of Paper Milk Containers*

M. J. Prucha
University of Illinois, Urbana, Illinois

The bottling of fluid milk in paper containers is not a new idea. In a book by Kenelm Winslow, entitled "Production and Handling of Clae Milk," published in 1909, the following statement appears on page 140: "The latest

* This time-temperature subject to change as a result of further studies being conducted by National Institute of Health.

* Read before the Twenty-sixth Annual Meeting of the International Association of Milk Sanitarians, Louisville, Ky., October 11-13, 1937.

departure in the way of a milk bottle is the single service milk container of pulp wood invented and made by G. W. Maxwell of 1201 Falsom Street, San Francisco, California. It is now in actual use by dairymen in Los Angeles, California."

While the paper milk container was invented some thirty years ago, very little attention was paid to it by the fluid milk industry or by the milk sanitarians. It is only within the last few years that the paper milk container has forced its way into the fluid milk industry and to the attention of the milk sanitarians.

The paper milk container brings with it new problems, economic, practical, and sanitary.

As a result of demand for information concerning the paper milk container, a study on the subject was undertaken by the Dairy Department, University of Illinois. This paper is a progress report on some sanitary problems connected with the use of paper containers for fluid milk.

There are on the market at present at least five different types of paper milk containers. The study reported here was carried on specially with the Pure-Pak milk container. In the case of this container, the paper (after it is made in the paper mill) is packed in large bundles and is shipped to the carton manufacturing company. Here the container is cut out, printed, and sealed along its long edge. It is packed and shipped to the dairy plant in a collapsed condition. In the milk plant the containers are fed into the Pure-Pak machine, made by the Ex-Cell-O Corporation of Detroit, Michigan. The container enters the machine at one end in its collapsed condition and comes out at the other end filled with milk and sealed. As it passes through the machine the container is formed, its bottom is sealed, it is dipped in hot paraffin, passed through a cooling chamber, filled with milk, and finally it is sealed and dated.

A paper mill requires a great deal of water so every mill is located by some abundant body of water—it may be lake, river or well. The spruce tree trunks are first washed and cleaned of bits of bark. As they pass from the washing machine to the cutter they are sorted, as only sound and free-from-bark-and-knots logs are acceptable. The logs are cut into ¾ inch chips. The chips are sorted as they pass on their way to the cooker. The cooking solution is made from sulphur and lime. The wood chips are cooked

in large steel cylinders, lined with brick, for about 15 to 20 hours at a temperature of 120° C. or above.

The digested wood pulp is dumped into large vats where it is washed with fresh filtered water. From here the pulp passes over screens and continues to be washed and cleaned of bits of knots. When in desired condition the pulp passes into large white-tile lined tanks where it is bleached. The bleached pulp passes into another series of tiled tanks where it is again washed, to remove the excess of chlorine and bleaching residue.

At this stage an emulsion of partly saponified rosin and paper makers alum ($Al_2(SO_4)_3 \cdot 18H_2O$ is added. The pulp then is pumped to a Jordan engine and then it passes to the paper machine vat. From here the pulp is picked out by revolving cylinders covered with fine mesh wire cloth. Layers of the pulp adhering to the cylinder are then carried on and pass over a large number—about 30—of large steel cylinders. These cylinders are heated with steam at about 15 pounds guage pressure. As the pulp—paper—comes off the last cylinder it is dry and hot, the water being evaporated from it; or rather it "boiled off" as the pulp passed over the hot cylinders. The paper is cut in suitable sheets and packed.

In the sulphite process of preparing pulp, the treatment is such that pulp is made practically sterile in three places. First in the steam digesting cylinders, the pulp comes out absolutely sterile. During the washing process it becomes contaminated by the water and equipment. In the bleaching vat it is again sterilized. It again becomes contaminated by the water as it is washed and diluted. The size also adds a few bacteria. As the pulp enters the paper machine and passes over the steam rollers it again is at least partially sterilized.

The bacteriological examination showed the pulp to be sterile in the bleaching vats. After it was washed, diluted, and treated with size, it gave a bacterial plate count of 400. As the diluted pulp entered the wire screen the count was 40. Two by two inch strips of paper, taken as they left the hot rollers, placed in 100 ml. of sterile water, and after shaking, plated, gave no colonies on 1 ml. plates. In other words, the paper was practically sterile on its surface.

Milk sanitarians should inspect paper mills and check on the pulp. In the first place, the water used for diluting the pulp usually comes from polluted streams or lakes.

Some paper mills have proper sanitary control over the water supply while other paper mills have not.

In the suggested standards for paper as printed in The Milk Sanitarian, Volume 6, pages 11-13, it is suggested that paper milk containers be made from virgin chemical or mechanical pulp and that prior to moisture-proofing the paper shall not have a count exceeding 500 colonies per gram of the disintegrated paper. Such a standard is extremely liberal. A quart paper container when dry weighs about 42 grams. A container made from such paper would harbor 21,000 in its walls.

When paper is made by the sulphite process and is bleached and is made in a continuous operation—that is, not stored in moist condition for some days—the bac-
2652 terial population of the paper is extremely low. A number of containers were beaten in a small glass churn until reduced to pulp. About 1500 ml. of sterile water were used for one container. Ten plates were poured, one ml. in each. Five plates had no colonies, two plates had one colony each, and three plates had two colonies each. Such counts mean practically nothing, except that the paper was practically sterile. In another test, twenty quart containers were broken up and jammed into a three-gallon milk can containing six liters of sterile water. After soaking for 20 minutes and shaking vigorously, one ml. of the water was plated in each plate. After two and one-half hours of soaking another set of plates was made. Again the plates gave counts of one or two colonies or none. The calculations from such counts gave 2.3 bacteria per square inch of surface.

Where paper is made for milk containers some medical examination of the worker handling and packing the paper should be required. Some mills have such standards. Occasional inspection of the premises and of the bundles of the paper are desirable. The Chicago Carton Company, where the containers are cut and printed, was found in an excellent sanitary condition. If paper containers become extensively used, such an establishment should be visited and inspected by milk sanitarians.

So far in our study, most of the experiments have been carried on with the Pure-Pak paper container. As stated already, the containers are shipped to the milk plant from the carton company and are paraffined by the machine at

the milk plant. The machine is set as to time but the temperature of the paraffin can be set as desired.

The bacteriological condition of the paraffined containers was determined at first by the standard methods recommendations. The containers were passed through the machine and were sealed, but no milk was put into them. At the laboratory they were opened, one hundred ml. of sterile water were poured in and after a thorough shaking, two plates—each containing one ml. of the rinse water—were plated. Most of these empty bottles were collected during two months, in which time the machine was used for bottling milk. Each day the first six bottles passing through the machine and also the last six after the milk was bottled, were taken for the test. Space does not permit the giving of the counts of individual containers, of which several hundred were examined. Most of the plates had one, sometimes two, and more often no colonies. The results forced us to the conclusion that the containers were practically sterile and that the standard method is no good for this purpose.

The following method was adopted after this. About 25-30 ml. of nutrient agar were poured directly into the container. After some agitation to bring all the surface in contact with the agar, the containers were incubated. To count the colonies the container was cut open and the slab of agar was placed on the counting glass, and the colonies were counted.

One hundred and ten bottles paraffined at 170° F. had all together 100 colonies; ninety-three containers paraffined at 180° F. had 49 colonies; ninety-eight containers paraffined at 185° F. had 29 colonies; and ninety-five containers paraffined at 190° F. had 53 colonies. Part of the time the standard agar plus one per cent lactose was used as nutrient agar and most of the time the tryptone dextrose agar was used. The conclusion drawn from these tests is that when sulphite-process bleached pulp is used for the paper, it is practically sterile, and when the containers are paraffined they also are practically sterile. It made no difference whether they were paraffined at 170, 180 or 190 degrees F.

Another group of 1,000 bottles from a different source was examined. The results of that examination were very similar. In this group of containers 45 percent of them developed no colonies, 38 percent of them had spreaders—

that is, spore producers—and 25 percent of the containers had paper defects. Of those with paper defects, 71 percent harbored spreaders. In Table I are given the colony

counts of the twelve worst containers and the presence of spreaders and paper defects is indicated. The paper defects manifested themselves as brownish patches in the paper under the paraffin and appeared to be caused by some hydrolytic change in the pulp.

Taken as a whole, as far as can be determined, the paper milk containers after they are paraffined are practically free from bacteria.

The paraffining of the containers is done primarily for the purpose of making the paper impervious to the milk. Since paraffining must be done at relatively high temperature the process also involves a bactericidal treatment.

This phase of the study had been conducted both in the milk plant and in the laboratory. For this purpose the containers were impregnated with a bacterial suspension of a given organism. For the most part a variety of B. prodigiosus was used. In the first part of this study the containers were dipped in a bacterial suspension usually having about 200,000,000 plate count. In dipping the containers they absorbed on the average about seven ml. of

the suspension. As soon as the containers were dry enough they were paraffined. To test for the presence of the organisms, about 30 ml. of nutrient agar were poured into each container and thoroughly shaken, then incubated. Many hundreds of containers were treated in this manner. The temperatures of 160, 170, 175, 180, 185 and 190 degrees F. were tried. Very irregular results were obtained. While most of the containers were free from the organism, invariably there would be a few containers in which the organisms were present. This was true of all the temperatures.

In one experiment the suspension had only 2,000,000 bacteria per ml. Of the three hundred bottles paraffined at 170°, 180° and 190° F. none had any of the bacteria present.

2653 The dipping of the paper containers in a suspension containing so many bacteria was discontinued. Instead of dipping, the containers were inoculated by putting one's hand in the suspension and then rubbing the inside walls of the containers with the hand. In one run six hundred containers were inoculated in this manner and were paraffined at 160°, 170° and 180° F.

Of the two hundred bottles paraffined at 160° F., nine were positive, of those paraffined at 170° F., one was positive, and of those paraffined at 180° F., two were positive.

Another method of inoculating the containers was tried. The operator handling the containers from the cartons in which they were shipped to the paraffining machine infected his hands in the bacterial suspension and then handled the containers. In one test, six hundred containers were paraffined, after being handled in this manner: two hundred at each of 170°, 180° and 190° F. All the containers paraffined at 170° F. and at 180° F. were negative. Of the two hundred containers paraffined at 190° F., one hundred and ninety-nine were negative and one was positive.

In these tests in which inoculated containers were paraffined, and a large number of these were paraffined in each test, invariably one or two containers would be positive, and that was irrespective of the temperature used. Whether the bacteria survived the paraffining or whether in handling such rich suspension an occasional accidental contamination took place, it is difficult to conclude. The heavier the inoculation the more positive cases appeared.

The study of paraffining the paper was also carried on

at the laboratory. Here small strips of paper, ½ by 2½ inches, were used. After the strips of paper were paraffined they were dropped in a test tube containing 15 percent milk and 85 percent water. After incubation of several days they were examined for the appearance of color. The results from one of the runs, given in Table II, are typical. In Table III, results are given from one of

the runs in which the inoculated strips of paper were exposed to sterile hot water instead of paraffin. The results show that the hot water treatment is more effective than the paraffin treatment. The difference is very pronounced. Water at 150° F. is more effective than paraffin at 190° F.

Tests were also made to determine how long the bacteria will survive on the impregnated strips of paper. Heavily inoculated strips of paraffined paper were examined daily. No living bacteria were found on the strips after the seventh day. When the unparaffined paper strips were inoculated and examined in the same manner no viable bacteria were present after the sixth day.

The tentative standards suggested in the report from the conference on paper milk containers are good. Perhaps they should be somewhat more exacting. The milk sanitarians should inspect and develop some score card for the mill where the paper is made. Health certificates of the employees handling the paper should also be made. Health certificates of the employees handling the paper should also be required, both in the paper mill, in the carton manufacturing company, and also in the milk plant wherever the milk containers are handled by hands. Inspection of the paper containers at the milk plant is necessary not only as to bacterial condition but as to appearance. The containers that are paraffined in a factory and shipped, ready to be filled, need to be well packed and protected in the shipment and at the milk plant. Also a proper storage room, free from insects and vermin and dust, must be provided at the plant.

Paraffining the containers at 185° F. for 30 seconds, when the containers are protected as above suggested, will result in a practically sterile container, and a container that is safe to use. However, entire dependence on paraffining to insure complete sterility of the container may not be sufficient.

2654 **PLAINTIFF'S EXHIBIT NO. 63.**

Are Paper Milk Containers Sanitary?

M. J. Prucha
Department of Dairy Husbandry
University of Illinois
Urbana, Illinois

"Are paper milk containers sanitary?" This question is of the same type as the one asked of a married man, "Have you ceased beating your wife? Answer yes or no." If the question of this paper reads, "Can paper milk containers be made so that they are sanitary?" then I can answer "Yes" without any hesitation.

Certain studies on this question have been carried on in our laboratories for the last twenty months. It is the purpose of this paper to present some of the results of this study to prove the above answer, namely, that paper milk containers can be made so that they are sanitary.

At this point it will be desirable to define a "sanitary container." While there will probably be differences of opinion among milk sanitarians, we offer the following definition: A sanitary container is one that is clean, free from visible dirt, that is protected against the contamination of harmful microorganisms, especially the disease-producing organisms, and that has as few bacteria of the harmless miscellaneous types as possible.

In the usual examinations of containers, such as glass milk bottles, attention is paid to the cleanness of the containers and then they are examined bacteriologically for the total number of bacteria. A hunt for disease bacteria is not attempted in the routine examination. We depend on preventive measures to keep the disease-producing bacteria out of the containers.

Our bacteriological study has dealt primarily with the number of bacteria in the paper milk containers at the different stages of their manufacture, and to some extent, observations were also made as to kind of bacteria.

Number of Bacteria in the Paper Board from Which Milk Containers Are Made

It has been felt by some sanitarians that the number of bacteria enmeshed in the paper board is an indication of its sanitary condition. In Table 1 are given results from

70 examinations of paper board coming from five different paper mills. Sixty-six of the 70 samples had some bacteria, ranging from 3 to 7,493 per gram of the paper. Four samples gave no growth on petri dishes.

2655 From these tests it is evident that paper can be made which is practically free from bacteria of any kind. Virgin pulp, freshly bleached and diluted with properly chlorinated water will give paper board practically free from bacteria.

The bacteria that are usually found enmeshed in the paper board are almost exclusively spore-producing organisms. According to J. R. Sanborn (1), B. sublitis, B. cereus, B. mycoides, B. tumescens, B. megatherium are the usual organisms found. Non-spore forming organisms are found only occasionally. These may be due to subsequent contamination, after the paper is made. The process of paper making is such that the paper is exposed to very hot steel rollers. Experiments conducted by E. Wheaton (2), showed that non-spore bearing organisms do not survive on the paper when the paper is inoculated heavily before it passes over the hot rollers.

Another point of sanitary importance regarding the paper board is the fact that the non-spore bearing organisms do not remain viable very long on the paper. In Table 2 are given results from one of the tests. In these tests plaques of paper were heavily inoculated by being dipped in a bacterial suspension, then placed in open petri dishes and kept at room temperature. At intervals they were examined for the presence of the inoculating organisms. Organisms like E. coli and B. prodigiosus usually died in about four days. Staphylococcus aureus remained alive a few days longer. This tendency for the microorganisms to die on the paper might be called "self-purification".

As the paper board leaves the hot rollers it is cut either in sheets of desired size or wound into rolls and sent to the carton factory. Here the containers are designed, cut, printed, and edges sealed with adhesive. In the case of the Canco and the Sealright containers, they are fabricated and paraffined at the carton factory and are shipped to the milk plant ready to be filled with milk and milk products.

The Pure-Pak containers are partly fabricated at the carton factory. Their shaping, the sealing of their bottoms and the paraffining are done at the milk plant. Since the

Pure-Pak machine was installed at the University Creamery an opportunity was afforded to examine the containers after they were shaped and their bottoms sealed and before they were paraffined. One hundred and twenty-eight containers were examined for bacteria. The results are shown in Table 3. In making the examination each container was rinsed with 100 ml. of sterile water and one ml. was plated in each of two plates. No colonies developed on two plates from 25 containers. From another 25 containers only one colony appeared on one of the two plates. Less than 10 colonies developed on the plates from 121 of the 128 containers.

The paper for these containers was handled at the paper mill, was transported to the carton factory, and there the containers were handled, exposed to the air and then transported to the milk plants. Here they were again handled and sealed with an adhesive. The results in Table 3 represent the contamination from all the sources to which
2656 the paper and the containers were exposed as they passed on their journey in the paper mill and from the paper mill to the point at which they were to enter the hot paraffine.

The adhesives that were used were frequently examined. The examination consisted of mixing 10 grams of the adhesive in 100 ml. of sterile water and then pouring 10 plates, each receiving 1 ml. of the mixture. As a rule the plates did not develop any colonies. The adhesives used for sealing these containers, therefore, did not contaminate the containers.

The next step in this study was the examination of the paraffined containers. As already stated, the Pure-Pak containers are paraffined at the milk plant, while the Canco and the Sealright containers are paraffined at the carton factory and are shipped to the milk plant, ready to be filled with milk. All the three types of the containers were examined. In Tables 4, 5 and 6 are presented the results of such examination.

The Pure-Pak containers were examined by rinsing each container with 100 ml. of water and pouring two plates, each containing 1 ml. of the rinse water. The Canco containers were examined by pouring into each container about 20 ml. of agar and leaving the agar in the container. After incubation the colonies were counted. The Sealright containers were examined by rinsing each container with 10 ml. of water and plating all the rinse water in three plates.

The outstanding result of this examination is the fact that in a large percentage of the containers no bacteria were found. Another large percentage of the containers gave so few colonies that it could be interpreted that the occasional colony did not come from the container but was an external contamination. Tanner (3) reports that over 80 per cent of the 7,000 Canco containers examined were found free from bacteria.

Complete elimination of bacteria from dairy utensils is rather difficult to accomplish in the routine operations in the milk plant. This is recognized by the sanitarians. In the Sixth Edition of the Standard Methods for Milk Analysis the following statement appears on page 58: "In testing milk bottles, 100 ml. of sterile water is added to each bottle. After it is vigorously shaken, 1 ml. of the rinse water is transferred to each of two petri dishes and 10 ml. of agar is poured in each petri dish. • • •

"Bottles developing not more than 1 colony per ml. capacity • • • shall be considered satisfactory. While this standard may be so severe that it will not be met in all instances in regions that are just beginning to work in this field, it has been found by experience that properly sterilized containers will meet the standard specified. The counts from poorly sterilized containers (glass bottles) usually greatly exceed this figure. Under these conditions, it is recommended that the enforcement of this standard be lenient at first."

The capacity of quart bottles is 950 ml. Therefore the standard is 950 bacteria per container. Applying this standard to the paper milk containers examined in this study, it is seen that only two Pure-Pak containers out of 395 examined did not meet the standard. Of the 1,155 Canco containers examined, only one did not meet the standard, and of the 226 Sealright containers, 11 did not meet the standard.

2657 S. V. Layson, E. G. Huffer and J. M. Brannon examined 454 glass milk bottles collected from 25 different milk plants. The results are summarized in Table 7. One hundred and eighteen bottles had no bacteria, 126 bottles had between 100 and 1,000 bacteria and 210 had more than 1,000 and hence did not meet the standard. Some of the bottles harbored several million bacteria. These bottles were collected from dairies well established in business and operating under certain regulations. The bottles were picked up at random at the point they were to be

used for milk and were supposed to be cleaned and sterilized.

The above reference to glass bottles should not be construed as a reflection on glass bottles. In properly managed and technically controlled milk plants, the bacterial population in glass bottles can and is effectively controlled.

The results of the bacteriological examination of the paper milk containers are conspicuous for the absence of bacteria in most of the containers and for the absence of coliform organisms. This has been accomplished by the industries involved in the manufacture without any official sanitary regulations. With the establishment of certain requirements it will be possible to make further improvements.

It is hoped that some reasonable sanitary regulations will be agreed upon to guide the industries in the manufacture of the paper board, in the handling of the paper and the containers, in the fabrication of the containers and in the storage and transportation of the containers, so that through preventive measures all danger of contamination by harmful bacteria can be assured, as well as the control and elimination of the non-pathogenic bacteria.

To many milk sanitarians the problem already appears to be practically solved, because some paper milk containers have already been accepted by many Boards of Health and other health agencies as satisfactory milk containers from the sanitary standpoint.

Certain of the milk containers have been approved by the Ministry of Health of Great Britain and the local authorities are also empowered to approve of cartons submitted to them for use both with ordinary milk and milk sold under special designation. Here in the United States the Council on Foods of the American Medical Association has voted to accept milk distributed in the single service type of certain containers. Also the American Association of Medical Milk Commission has approved the closure on the single service paper containers of certain types.

The paper milk containers are here. They are here to stay. To what extent they will be used in the dairy industry will probably be largely determined by economic factors and not by sanitary restrictions.

Fieldcrest Dairies, Inc.

(Company, Corporation or Incorporated)

These Articles of Incorporation are signed and acknowledged by the incorporators for the purpose of forming a corporation for profit under the provisions of Act No. 327 of the Public Acts of 1931, known as the Michigan General Corporation Act, as follows:

Article I.

The name of this corporation is Fieldcrest Dairies, Inc.

Article II.

The purpose or purposes of this corporation are as follows: to buy, sell, deal in, manufacture, process, cut, store and ship cream, milk, butter, cheese, ice-cream, ice-cream mix, sugar, condensed milk, powdered milk, evaporated milk, malted milk, distilled water, milk products and by-products, ice and all such other articles as may be necessary or may be conveniently used in connection with the aforesaid mentioned business or businesses; to own, lease and manage, directly or through subsidiaries, dairies and dairy farms, creameries and cheese factories, and conduct a general manufacturing and merchandising business.

(In general to carry on any business in connection therewith and incident thereto not forbidden by the laws of the State of Michigan and with all the powers conferred upon corporations by the laws of the State of Michigan.)

Article III.

Location of the corporation is Detroit, in the County of Wayne, State of Michigan.

Post Office address of registered office in Michigan is 1611 National Bank Building, Detroit, Mich.

Article IV.

The total authorized capital stock is

(1) Common 2500 shs. Par Value $10.00 per share.

(3) The following is a description of each class of stock of the corporation with the voting powers, preferences and rights and qualifications, limitations or restriction thereof:

Each share of stock shall have equal voting power, and the holders thereof shall be entitled to share, equally and ratably, in all dividends.

2663 The amount of paid in capital with which this corporation will begin business is $1,000.00. (This must not be less than $1,000.00)

Article V.

The names and places of residence or business of each of the incorporators and the number and class of shares subscribed for by each are as follows:

Names	Residence or Business Address	Number of Shares		
		Common	Preferred	Non-Par
Fred Dye	1611 National Bank Bldg. Detroit, Michigan	100	none	none

Article VI.

The names and addresses of the First Board of Directors are as follows:

Name	Address
Fred Dye	1611 National Bank Building, Detroit, Mich.
Edna E. Martin	1611 National Bank Building, Detroit, Mich.
Jarl A. Andeer	1611 National Bank Building, Detroit, Mich.

Article VII.

The term of this corporation is fixed at thirty years.
2664 In Witness Whereof the incorporator has signed these articles of Incorporation this 21st day of October A. D. 1937.

Fred Dye.

Application for License of Foreign Corporation

November 24, 1937

To Edward J. Hughes, Secretary of State, Springfield, Illinois:

Fieldcrest Dairies, Inc., a corporation organized and existing under and by virtue of the laws of the State of Michigan desiring admission into the State of Illinois, for the purpose of transacting business or exercising its corporate powers or franchises, hereby makes application for a certificate of authority and submits the following statement pursuant to "The Business Corporation Act," of Illinois.

First—The above corporation was duly incorporated under the laws of the State of on the 5th day of November. A. D. 1937 for a term of 30 years.

Second—The location of the principal office as designated in the charter is Detroit, Michigan. The locations of its principal places of business are Detroit, Michigan, Chicago, Illinois.

Third—The address of the proposed registered office in the State of Illinois will be located at 20 North Wacker Drive, in the city of Chicago, Illinois, and the name of its proposed registered agent in this State at such address is: H. M. Dean.

Fourth—The corporation is transacting business and qualified under the foreign corporation laws of the following states and countries other than Illinois: Detroit, Michigan.

Fifth—The names of its officers and directors and their addresses are as follows:

Name	City and State	Street and No.
President S. E. Dean,	Chicago, Ill.	20 North Wacker Drive
Secretary H. M. Dean,	Chicago, Ill.	20 North Wacker Drive
Director S. H. Dean,	Chicago, Ill.	20 North Wacker Drive
Director A. T. O'Connor,	Chicago, Ill.	20 North Wacker Drive

2668 Book 1145 Page 115

Sixth—The purpose or purposes for which it was organized which it proposes to pursue in the transaction of business in this State is: to buy, sell, deal in, manufacture, process, cut, store and ship cream, milk, butter, cheese, ice cream, ice-cream mix, sugar, condensed milk, powdered milk, evaporated milk, malted milk, distilled water, milk products and by-products, ice and all such other articles as may be necessary or may be conveniently used in connection with the aforesaid mentioned business or businesses; to own, lease and manage, directly or through subsidiaries, dairies and dairy farms, creameries and cheese factories, and conduct a general manufacturing and merchandising business.

2669 Seventh—The number of shares which it has authority to issue, itemized by classes, par value of shares, shares without par value, and series, if any, within a class, is:

Class	Series (if any)	Number of Shares	Par value per share or statement that shares are without par value.
one—common	none	2500	par value $10—

Eighth—The number of its issued shares, itemized by classes, par value of shares, shares without par value, and series, if any, within a class, is:

Class	Series (if any)	Number of Shares	Par value per share or statement that shares are without par value.
one—common	none	100	par value $10—

Ninth—The amount of stated capital and the amount of paid in surplus of the corporation as defined by "The Business Corporation Act" of Illinois, is:

Stated Capital	$1,000.00
Paid in Surplus	none
Total	$1,000.00

*Tenth—Give an estimate of the total value of all the property of the corporation for the following year $1,000.00

Eleventh—Give an estimate of the total value of all the property of the corporation for the following year that will be located in Illinois $1,000.00

Twelfth—State the estimated total business of the corporation to be transacted by it everywhere for the following year $15,000.00

Thirteenth—State the estimated annual business of the corporation to be transacted by it at or from places of business in the State of Illinois $20,000.00

Fourteenth—

Interrogatories:

(a) Is the corporation actually transacting business at the present time in the State where it was organized? NO

(b) From what office will the affairs of the corporation be managed? Chicago, Illinois at 20 North Wacker Drive offices

(c) To what office or offices will all contracts with the corporation be forwarded for final acceptances? Chicago, Illinois

(d) At what office or offices will the directors and stockholders meeting be held? Chicago, Illinois

(e) The number of shares of the capital stock of all classes owned by residents of Illinois is: 100 shares

(f) The number of shares of capital stock of all classes owned by non-residents of Illinois is: no shares

(g) Is the corporation transacting business in this State at this time? no

---

* Property as used in this application shall apply to all property of the corporation, real, personal, tangible, intangible, or mixed without qualification.

(h) If your answer is in the affirmative, state the exact date on which it commenced to transact business in Illinois.

December 17, 1937

Mr. George D. Scott
Ex-Cell-O Corporation
1200 Oakman Boulevard
Detroit, Michigan

Dear Mr. Scott:

I am enclosing a copy of a letter received to-day from Dr. Parran. I presume you have had your conference as indicated in this letter with both Dr. Parran and Mr. Frank. I shall be glad to hear from you if I can be of further service to you.

If, in your opinion, you have no further need for my services after the present time, it will be perfectly agreeable for me to discontinue my work January 1st, or at any time you might think it desirable. Mr. Dean called me and I have postponed a meeting with him pending the outcome of your Washington conference. As I told Mr. Dean on the telephone, I was not at all sure that he needed my services. When the proper time comes, I will discuss this with Mr. Dean, but I am not at all convinced that I can render him any worth while service after he installs a Pure-Pak machine in his plant. The Chicago Health Department will supervise this and I do not see the need of a duplicate supervising service. However, this matter can be settled at a later date.

Yours truly,
Lloyd Arnold

Mr. George Scott
Ex-Cell-O Corporation
1200 Oakman Boulevard
Detroit, Michigan

Confidential

Dear Mr. Scott:

I spent three hours, the whole of yesterday afternoon (Wednesday) at the Chicago Board of Health. I have never been concerned with a situation so hopelessly involved as yours.

First: Paper containers for milk are not included as a part nor are they recognized by the United States Public Health Service Standard Code. This is a great disadvantage. There is therefore a legal justification for the exclusion of this type of package if the local health authorities wish to do so.

Second: Dr. Bundesen does not trust paper containers for fresh-fluid pasteurized milk. He feels that the use of such containers will lower the present milk sanitary standards and quality. He is honest and considers this procedure a health safeguard.

Third: I saw all correspondence relative to Frank—Dean correspondence. Surgeon General, Dr. Thomas Parran is intimately involved in this matter. Dr. Bundesen wrote him personally protesting the first letter from a junior man. Dr. Parran answered this and apparently dictated the letter signed by Frank to Dean after the first letter referred to. In the correspondence Dr. Parran thought paper milk containers had proved satisfactory and were being used to an extent that warranted favorable consideration. He admitted they were not approved in the Standard Ordinance, but he wants the Advisory Committee of Frank's to put these containers in the Code. Dr. Parran's letter was very friendly toward paper containers.

Fourth: I am being placed in an embarrassing position. I know Doctors Bundesen, Parran, etc. as a research man in Public Health and Bacteriology. The report I made to Bundesen was read by him with interest. I am to get it back today. I will forward it to you. I think you
2691 could get farther by seeing Dr. Parran with this report than for me to see them. They would not under-

stand my presence. They have seen reports from me many times. We usually draw a clear line of demarkation between consulting scientific service and "influence" due to personal or professional connections or friendship.

Fifth: Dr. Bundesen wants me to keep the paper container problem in hand. He asked me to draft standards to be submitted to the United States Public Health Service. This is a future proposition and will require several weeks, then further delay in getting these standards adapted. Bundesen is satisfied with his present milk situation and sees no need to hurry. He will not write the United States Public Health Service at this time to formulate standards. He wants me to submit more data on this subject. This is crossing over into the Breed-Sanborn field.

I think you should see Tom Parran. Your viewpoint has never occurred to him and you will find him reasonable and fair. I am writing him on University letterhead and am enclosing a copy.

Yours truly,
Lloyd Arnold

2693 For Information of Mr. George Scott

December 9, 1937.

Dr. Thomas Parran, Surgeon General,
United States Public Health Service,
Washington, D. C.

Dear Doctor Parran:

The single service paper milk container has been handled badly in the Chicago area. Conflicting viewpoints and misunderstandings have developed. I became interested in this situation a month or so ago.

Mr. George Scott of the Pure-Pak group of Detroit has seen me several times about his product. I have been to Geneva for a conference with Doctors Breed and Sanborn about the paper board stock used in his product. I am convinced of the sincerity and the desire to co-operate in every way on the part of Mr. Scott and his associates. I feel that I have rendered all the advice I can in this situation. Some misunderstandings have developed and I wish you would see Mr. Scott and straighten out several points. I know of no one who could advise Mr. Scott as to the proper course and procedure he should follow as well as you.

I shall be glad to render what service I can and will gladly come to Washington at any time to confer with anyone you might suggest.

Yours truly,
Lloyd Arnold, M.D.

November 12, 1937.

Mr. S. E. Dean, Jr.
Dean Milk Company
20 North Wacker Drive
Chicago, Illinois

Dear Mr. Dean:

In Mr. Frank's absence I have your request of November 9 for our opinion on single service containers in the distribution of milk and milk products.

Studies are being made by various agencies with the view of formulating suitable specifications for the manufacture of paper for bottles, also for the manufacture, shipment, and use of the bottles themselves. There is as yet, however, no general agreement on satisfactory specifications. For this reason we have suggested that health officers grant provisional permits for the use of paper bottles if such bottles are properly protected against contamination during shipment, storage, and handling at the milk plant; but all prospective users should be warned that much more stringent regulations may later be made.

Yours very truly,
A. W. Fuchs,

Mr. S. E. Dean, Jr.
Dean Milk Company
20 North Wacker Drive
Chicago, Illinois

Dear Mr. Dean:

Upon my return to Washington my attention has been directed to your letter of November 19 and Mr. Fuchs' reply of November 12.

It has recently developed that there is a wide difference of opinion among health authorities as to whether paper milk bottles should be approved and if so under what safeguards. For this reason we have now concluded that this entire problem should be brought before the Milk Sanitation Advisory Board at its next meeting, and that pending its decision local health authorities will be justified in maintaining the status quo. This means that in such cities as Chicago, where the use of paper milk bottles has not been permitted, the Board of Health will be justified in continuing to withhold permission at least until the Advisory Board reaches a conclusion.

Very truly yours,
Leslie C. Frank,

2697 PLAINTIFF'S EXHIBIT NO. 88.

Copy of last pages of Defendants' Exhibit No. 31.
Proposed Standards to be Met by Paper Milk Containers.

1. The surfaces of paper milk containers coming in contact with milk shall be impermeable and non-porous, and shall be smooth and unbroken. Paraffin-immersion treatment, as employed at present, is not considered as meeting this definition.

2. The surface of the container in contact with milk shall be sterile or constructed of such materials that it can be disinfected in the dairy before use.

3. The material forming the surface shall be inert and of such composition that it will not react with milk, or "flake-off" into the milk. No toxic material which may be deleterious to health shall be present in paper, moisture-proofing materials, adhesives or other materials used in

the manufacture or subsequent treatment of paper milk containers.

4. Containers shall be made from virgin pulp or other suitable material and such board or material, prior to moisture-proofing, shall not have a bacterial count exceeding 500 colonies per gram.

Paper and similar materials to be used in the fabrication of milk containers shall be manufactured under the supervision and inspection of an official agency such as the United States Public Health Service. Such materials shall be manufactured under sanitary conditions and the plant, surroundings, equipment and method in
2698 paper mills and conversion plants shall meet the requirements of the United States Public Health Service for grade A milk plants.

Paper rolls, packages or boxes in which milk containers or materials for fabricating milk containers are shipped shall bear an approval stamp of the official inspection agency and such stamp shall identify, by number or other approved method, the source of the product.

Only water meeting the Federal standard for safe drinking water shall be used in the treatment of pulp or other materials and in any subsequent treatment of containers.

Unless used immediately after manufacture, container blanks shall be wrapped, sealed and protected from contamination until used. When used the outside sheet on rolls or the top and bottom sheets of sheeted stock shall be discarded in all cases.

5. All stock and containers shall be handled mechanically in the conversion plant as far as possible. Following fabrication, until final filling and sealing in the milk plant, container surfaces with which milk or milk products come in contact shall be protected from contamination.

6. Throughout the processes of printing, folding, sealing, adhesive application, or packing prior to shipment to milk plant, all stock and containers shall, as far as
2699 feasible, be handled mechanically and be suitably wrapped or packaged before shipping.

Packaged container stock at milk plants shall be kept in a clean, dry place and opened only for immediate use. Where it is necessary to form or manipulate containers, all surfaces with which milk or milk products may come in contact, shall be protected from human handling.

7. The glueing or sealing of container board shall be accomplished by means of non-fermentable adhesives. Ad-

hesives must not contaminate containers in any manner, nor contain any substance in amounts detrimental to health.

8. Cases for shipping empty containers shall be constructed of board or wrapping designed adequately to protect containers from injury or abuse due to tearing or breaking. Containers shall be stored in sealed, dry, unbroken cases, in a dry, vermin-proof location. Partly empty shipping cases of prefabricated containers shall be resealed, rewrapped, or otherwise protected from contamination during storage. Empty containers shall not be exposed to contamination at any time.

The opening of shipping cases and the storing of containers shall be done in a room separate from other milk handling equipment.

9. Equipment used for moisture-proofing, bactericidal treatment, filling or otherwise handling paper or similar materials to be used for milk containers shall conform to the requirements of the United States Public Health Service for milk handling equipment used in grade A milk plants.

2700 10. In the filling and handling of the container, milk shall be so handled to prevent adulteration, and the contents of the container shall not be contaminated by micro-organisms, chemicals or other substances contained in the material forming the wall.

September 16, 1939.

Mr. George D. Scott,
Sales Manager,
Pur-Pak Division, Ex-Cell-O Corp.,
1200 Oakman Boulevard,
Detroit, Michigan.

Dear Mr. Scott:

Your Washington attorney, Mr. Sumner S. Kittelle, requested us, under date of September 15, to send you certain information relative to the requirements for paper milk bottles in the Milk Ordinance and Code recommended by the Public Health Service.

Section 10 now provides that milk and milk products sold in distributors' containers in quantities of less than one gallon shall be delivered in standard milk bottles. This has been amended so as to add "or in single-service containers," and will so appear in the forthcoming printed 1939 edition, which is to be issued in about two months.

The specifications for single-service containers, etc., which will appear in the new edition will require bactericidal treatment equivalent to contact with paraffin for at least 25 seconds at at least 180° F. or for at least 35 seconds at at least 175° F. in approved equipment operated in an approved manner. (These time-temperature combinations are, however, subject to change as a result of further tests now being conducted.) Contact with paraffin at the required temperature for part of the required time combined with contact with hot air at the required temperature for the remainder of the required time will be

interpreted as complying with this requirement unless and until such combination is demonstrated to be inadequate for proper bactericidal treatment.

Very truly yours,
A. W. Fuchs,
A. W. Fuchs,
Senior Sanitary Engineer, for Chief,
Sanitation Section.

Microbiology in Pulp and Paper Manufacture.

J. R. Sanborn
New York Agricultural Experiment Station,
Geneva, New York.

Scope of Pulp and Paper Mill Microbiology.

Many pulp and paper mills are slow to correlate mill problems in biology and sanitation with the requirements of sanitarians in their applications of paper products to new uses. The perennial biological problem of pulp and paper mills is slime which has been shown to affect paper quality.(1) What the average paper maker calls slime, however, is only a small part of pulp and paper mill microbiology. The growths which may be produced in mill systems are as varied as the diversified predominating types of organisms, including species responsible for decomposition, discoloration and spotting of pulp and paper. It is obvious that slime problems should not be looked upon as restricted or transient conditions. They represent general microbiological hazards requiring the application of consistent programs of prevention.

Several years ago this situation was seriously considered by certain mills in the light of possible effects upon the sanitary condition of paper products. It was found, for example, that container board for food packaging may harbor thousands of mico-organisms per gram of paper, including coliform organisms and filamentous fungi. Problems of sanitation and food spoilage from the use of highly contaminated container board were immediately investigated. Studies such as these have brought to the attention of the industry the fundamental importance of microbiology and practical mill sanitation.

2713 Mills are now viewing critically their water supplies and the condition of raw materials. They are studying the problem of white water utilization from the standpoint of recontamination of the system by undesirable bacteria, as well as from economic and operative aspects.

Presented before the Empire State Section of the Technical Association of the Pulp and Paper Industry, Syracuse, New York, November 13, 1937.

Plants so fortunately situated as to have naturally pure process water do not ordinarily find it difficult to control the development of micro-organisms. Polluted supplies present at the outset a serious obstacle to mill sanitation, requiring careful attention to purification problems which may be aggravated by wide fluctuations in degrees of pollution. Nearly all of the undesirable mill contamination comes from water, though occasionally evidence points to organisms from pulp wood, lap stock, and various raw materials. Conditions in piles of pulp wood sometimes favor the development of fungi. Spores and growth fragments may be carried to the mill by air dissemination or on the boots and clothing of workers.

Besides wood rotting fungi which may be isolated, such as members of the genera Fomes, Polyporus, and Stereum, other fungi, more or less troublesome in pulp and paper manufacture, are sometimes present, including Trichoderma, Botrytis, Penicillium, Aspergillus, Alternaria, and Stemphilium.

Lap stock of virgin pulp, improperly stored, frequently shows marked evidence of fungus growth, discoloration and decomposition. A few types exert a bleaching action on pulp. The fungi causing numerous discoloration difficulties consist of a number of well-known species and various slime-formers, such as

Trichoderma sp.	Chaetomium sp.
Cladosporium sp.	Trichothecum roseum
Verticillium sp.	Aspergillus oryzae
Sporotrichum sp.	Aspergillus niger
Alternaria sp.	Acrostalagmus sp.
Penicillium sp.	

In addition to effective water purification, therefore, methods of practical mill sanitation must be followed to prevent colonization and spread of undesirable bacteria and fungi. Table 1 presents a brief comparison of six mills manufacturing miscellaneous grades of paper, illus-
2714 trating concisely, though incompletely, the complex microbiological conditions existing at some of these plants. The counts were obtained by the plating method using standard agar.

This table shows the variations in raw water counts among the rivers of these regions but gives no indication

of the fluctuations which some of them exhibit. In the mills of the Northeast, slimes caused by typical river water bacteria increase during summer months. Fungus growths may cause greatest difficulty in the fall and late winter. Periodic discoloration troubles also occur due to growth of algae in raw water and development of iron bacteria in pipe lines. Reference has previously been made to these various groups of organisms found in pulp and paper mills.(1) (2)

Table 1. Approximate Microbiological Conditions at Representative Pulp and Paper Mills of the Northeast

Mill	Raw Water Colonies per cc. 32°C.-48 Hrs.	Chlorinated Fresh Water 32°C.-48 Hrs.	Heaviest Contamination	Average Count in System	Count During Periods of Best Control	Season of Greatest Slime Difficulty	Troublesome Types of Organisms
1	500	10	3,435,000 (Ground Wood Mill)	424,000	Less than 100 (Sulfite Mill)	October, July and August	Non-Spore-bearing Bacteria. Spore-bearing Bacteria. Filamentous and Yeast-like Fungi.
2	13,600	5	4,820,000 (Secondary Stock)	92,260	Less than 100 (Bleached Sulfite Stock)	May to August	Non-Spore-bearing Bacteria. Spore-bearing Bacteria. Micrococci.
3	290	8	5,760,000 (Paper Mill White Water)	603,225	6,000 (Sulfite Mill)	February and March, June to August	Yeast-like and Filamentous Fungi. Non-spore-forming Bacteria.
4	22,700	10	5,000,000 (Paper Mill White Water)	990,850	122,500 (Sulfite Mill)	April to August	Non-spore-bearing Bacteria. Spore-forming Bacteria. Filamentous and Yeast-like Fungi.
5	2,150	0	2,250,000 (Paper Mill White Water)	158,570	Practically Free of Micro-organisms (Ground Wood White Water)	October	Filamentous Fungi.
6	2,000	17	280,000 (Ground Wood Mill)	7,450	Less than 100 (Bleached Sulfite Stock)	June to August	Non-spore-forming Bacteria. Spore-forming Bacteria. Filamentous Fungi.

2716 Development of Micro-organisms in Mill Systems.

Examinations of blow pit stock before introduction of white water, show that the pulp produced by sulfite mills is sterile. In the case of ground wood, it has been found that, while stock taken directly from grinders is frequently practically sterile, heat-resistant organisms may persist. Unless steps are taken to reduce contamination from recirculating white water, large numbers of bacteria may be introduced into pulp from this source. The situations at various mills are indicated by the following figures:

Table 2.

Contamination of Pulp by Organisms from White Water.

	Mill A	Mill B	Mill C		Mill D
	Grinder Stock	Blow Pit	Grinder	Blow Pit	Blow Pit
Fresh Pulp..... (Colonies developing per cc. in 48 hrs. at 32°C. on standard agar).	0	0	0	0	0
Bacterial Count per cc. in Reused White Water	600	155,000	1,000,000	2,104,000	415,000

Starting with this original contamination, further increases during subsequent operations or decreases in bacterial numbers due to germicidal treatments have been described elsewhere.(1) Effective control of white water contamination is being maintained at a number of mills. This is done through the use of fresh water make-up and direct application of bactericidal agents. The effective use of bactericidal treatments is essential not only to efficient mill operation and paper quality but also to the production of paper which meets the sanitary requirements of public health authorities.

2717 Microbial Content of Finished Paper.

For the purposes of the present discussion, pulp and paper mill micro-organisms may be divided into two classes, the heat-resistant and non-heat-resistant species. The former group includes various slime-producing organisms, spore-bearing bacteria, and micrococci. Many non-spore-

bearing bacteria from water supplies and a number of filamentous fungi occur in the non-heat-resistant class. Abundant contamination with miscellaneous types of organisms takes place at deckers, screens, head boxes and in paper machine white water.

As the sheet goes over the driers, the surface of the paper reaches temperatures of 80° to 100°C., or over. It is difficult to determine the actual temperature of the interior of the sheet and experimental results vary. While there are considerable reductions in bacterial numbers during this process, drier temperatures cannot be relied upon to eliminate all of the non-spore-forming bacteria in pulp, nor spore-producing species usually present in appreciable numbers. Container board made from virgin pulp produces on standard agar less than 500 colonies per gram of disintegrated stock. In types of container board where less attention is paid to sanitation in manufacturing operations or quality of pulps employed, counts may be much higher than 500.

It would be decidedly advantageous to the pulp and paper industry to produce consistently sterile paper for the packaging of perishable foods and sanitary protection of other easily contaminated products. Definite progress toward this goal is being made by the majority of mills producing milk container board. The beneficial results achieved by plants which persistently practive cleanliness and microbiological control are reflected in the improved sanitary condition of food paper containers used for perishable food products such as milk.

The entire industry should be cognizant of and prepared to apply this sanitary technique, which is based upon intimate knowledge of mill microbiology and specific preventive measures. Public Health authorities are watching with interest the hygienic developments in the making and handling of bacteria-free paper.

2728 DEFENDANT'S EXHIBIT NO. 16.

Sec. 10. Transferring or Dipping Milk; Delivery Containers; Handling of More Than One Grade; Delivery of Milk at Quarantined Residences.

Except as permitted in this section, no milk producer or distributor shall transfer milk or milk products from one container to another on the street, or in any vehicle or store, or in any place except a bottling or milk room especially used for that purpose. The sale of dip milk is hereby prohibited.

All pasteurized milk and milk products shall be placed in their final delivery containers in the plant in which they are pasteurized, and all raw milk and milk products sold for consumption in the raw state shall be placed in their final delivery containers at the farm at which they are produced. Milk and milk products sold in the distributor's containers in quantities less than one gallon shall be delivered in standard milk bottles. It shall be unlawful for hotels, soda fountains, restaurants, groceries, and similar establishments to sell or serve any milk or milk product except in the original container in which it was received from the distributor or from a bulk container equipped with an approved dispensing device; provided that this requirement shall not apply to cream consumed on the premises, which may be served from the original bottle or from a dispenser approved for such service.

No milk or milk products shall be permitted to come in contact with equipment with which a lower grade of milk or milk product has been in contact unless such equipment has first been thoroughly cleaned and subjected to bactericidal treatment.

Bottled milk or milk products, if stored in water, shall be so stored that the tops of the bottles will not be submerged.

It shall be the duty of all persons to whom milk or milk products are delivered to clean thoroughly the containers in which such milk or milk products are delivered before returning such containers. Apparatus, containers, equipment, and utensils used in the handling, storage, processing, or transporting of milk or milk products shall not be used for any other purpose without the permission of the health officer.

The delivery of milk or milk products to and the collection of milk or milk-products containers from quarantined residences shall be subject to the special requirements of the health officer.

2729 DEFENDANT'S EXHIBIT NO. 17.

(Section 10 as it will appear in the 1939 printed Public Health Service Milk Code.)

"Sec. 10. Transferring or Dipping Milk; Delivery Containers: Handling of More Than One Grade; Delivery of Milk at Quarantined Residences.

"Except as permitted in this section, no milk producer or distributor shall transfer milk or milk products from one container to another on the street, or in any vehicle or store, or in any place except a bottling or milk room especially used for that purpose. The sale of dip milk is hereby prohibited.

"All pasteurized milk and milk products shall be placed in their final delivery containers in the plant in which they are pasteurized, and all raw milk and milk products sold for consumption in the raw state shall be placed in their final delivery containers at the farm at which they are produced. Milk and milk products sold in the distributors' containers in quantities less than one gallon shall be delivered in standard milk bottles or in single-service containers. It shall be unlawful for hotels, soda fountains, restaurants, groceries, and similar establishments to sell or serve any milk or milk product except in the original container in which it was received from the distributor or from a bulk container equipped with an approved dispensing device: Provided, That this requirement shall not apply to cream consumed on the premises, which may be served from the original bottle or from a dispenser approved for such service. It shall be unlawful for any hotel, soda fountain, restaurant, grocery, or similar establishment to sell or serve any milk or milk products which have not been maintained, while in its possession, at a temperature of 50° F. or less.

"No milk or milk products shall be permitted to come in contact with equipment with which a lower grade of milk or milk product has been in contact unless such equipment

has first been thoroughly cleaned and subjected to bactericidal treatment.

"Bottled milk or milk products, if stored in water, shall be so stored that the tops of the bottles will not be submerged.

"It shall be the duty of all persons to whom milk or milk products are delivered to clean thoroughly the containers in which such milk or milk products are delivered before returning such containers. Apparatus, containers, equipment, and utensils used in the handling, storage, processing, or transporting of milk or milk products shall not be used for any other purpose without the permission of the health officer.

"The delivery of milk or milk products to and the collection of milk or milk-products containers from residences in which cases of communicable disease transmissible through milk supplies exist shall be subject to the special requirements of the health officer.

4351				185°	5.7	5.8	5.8	1.2

The above table indicates that, when paraffin is heated, some of the paraffin is decomposed into acid products. This decomposition increases with rise of temperature.

Dr. Herman N. Bundesen
Board of Health,
Chicago, Ill.

Dear Dr. Bundesen:

We would like to make application to meet the Board of Health as soon as possible in order to present to them the facts regarding delivering milk to the City of Chicago in paper containers instead of bottles.

At that time we will be very glad to have all the facts and figures on what is going on in other cities, like Philadelphia, New York, etc., and will appreciate it very much if you can get permission for us to be present at the next meeting of your Board.

Awaiting your reply, and thanking you for many past favors, we are

Yours truly
Dean Milk Company.

SED:LD.

2744 DEFENDANT'S EXHIBIT NO. 23.

August 2, 1938

Dr. Herman N. Bundesen, President
Board of Health
City Hall
Chicago, Illinois

Dear Dr. Bundesen:

Thank you for your letter of July 25, written in reply to my letter of July 8, which I had addressed to Mr. Paul Krueger, of your Department, and in which we again respectfully requested permission be granted to milk plants located in the City of Chicago to distribute their dairy products in Pure-Pak single service containers in your city.

While, in your direct reply to my letter, you did not state your current position in regard to Pure-Pak containers, you did enclose a carbon copy of a letter written by you, July 22, and addressed to Mr. S. E. Dean, Jr., which does explain your present attitude . . . which is extremely interesting to us.

With reference to the third paragraph of your letter to Mr. Dean—particularly to the fact that your records are not in accordance with the statement in Mr. Dean's letter, regarding favorable reports from investigators—I would like to say, Dr. Bundesen, that, in all investigations we have had conducted by nationally accepted leaders in bacteriology, research, and dairy husbandry, we, too, have found all of them favorably impressed with the sanitary aspects of Pure-Pak containers.

Not having a copy of Mr. Dean's letter to you, nor any knowledge of its contents, we, of course, do not know to whom he referred as a "committee". Neither do we know which member of the "committee" is not in accordance with Mr. Dean's statement, according to your records. However, if you will let us know which member is not in accordance, and what his objections are, we shall be more than glad to get in touch with him and make available to him all data, and make every possible effort to clear up any points about which this gentleman is still doubtful. Will you be kind enough to submit this information to us?

We are aware of the fact that you enforce in Chicago

the Milk Ordinance of the U. S. Public Health Service. We believe this is a very fine procedure on your part, and that the laws of milk sanitation would be generally upon a higher plane today if all local health ordinances followed more closely—at least in spirit—to the model
2745 ordinance laid down by the U. S. Public Health Service.

You see, Dr. Bundesen, we in the single service paper milk bottle industry—and I am speaking particularly for Pure-Pak—have absolutely no quarrel with the National Milk Code and Ordinance, nor with those authorities who operate under it. The National Code and Ordinance is in no way, either in letter or spirit, antagonistic towards single service containers. True, its fundamental principles were written a great many years ago, and would not include the present, more sanitary milk receptacle—because it was then unknown.

We do feel, however, that the omission of reference to single service containers should not deter progressive health authorities, in this country, from the acceptance of something new in milk sanitation, if the thing, or method, is proven to be better by a preponderance of evidence, as is the case with the single service container.

For a period of about 8 months, I have personally kept in very close touch with the sanitary development of single service containers, and with those authorities who have been making detailed investigations as to their merits. Among a great many other authorities have been individuals in the U. S. Public Health Service—particularly Mr. Leslie C. Frank.

Immediately upon receipt of your letter of July 25, I took the liberty of contacting Mr. Frank by telephone in Washington, D. C., and asked him to advise me as to the progress being made toward identifying single service containers by inserting regulatory paragraphs governing their distribution in the National Ordinance.

Mr. Frank told me that a great deal of progress had been made. In fact he told me that his department had completed a "modification of the U. S. Public Health Service Ordinance and Code, to provide for the use and sanitary control of single service containers", and that these modifications had been mailed to each member of his National Advisory Board, for consideration prior to their vote of acceptance or rejection at the forthcoming meeting in Washington.

Now, Dr. Bundesen, we know that you enforce the U. S. Public Health Service Milk Ordinance and Code in your city. The ordinance, as now written, is not antagonistic or unfriendly to single service containers. Mr. Frank has told me that a tentative ordinance for the use and sanitary control of single service containers has already been written by his department. You say that you "look to the U. S. Public Health Service for technical advice with respect to public health problems. The U. S. Public
2746 Health Service has seen fit to recognize single service containers by issuing tentative modification of the code for their use and control. I wonder, then, if this fact will be accepted by you as sufficient evidence that there are no health hazards involved in the use of Pure-Pak containers for dairy products. If so, will you now give us permission to move equipment into Chicago? You could then personally go over the sanitary angles of same, under actual dairy conditions, with a view toward issuing us the necessary permit to begin operations in your city.

I want to assure you of my most sincere appreciation of your consideration of this request, and thank you for a reply at your earliest convenience.

Very truly yours,

.....

Sales Manager—Pure-Pak Division
Ex-Cell-O Corporation.

DEFENDANT'S EXHIBIT NO. 24 is omitted at this point as it appears as Exhibit A to the Defendant's Answer.

2786 DEFENDANT'S EXHIBIT NO. 25.

Resolution.

The following Resolution was adopted as a part of the rules and regulations of the Board of Health at its meeting of August 6, 1935:

Whereas, it has come to the attention of the Board of Health of the City of Chicago that butter made from cream from unhealthy cattle has been shipped into the city of Chicago for human consumption; and

Whereas, this condition, if allowed to prevail, will become a distinct health menace to the City of Chicago; and

Whereas, There is not now in force and effect in the city of Chicago any ordinance or rule or regulation of the Board of Health of the City of Chicago affecting the general sale of butter within the said City of Chicago; and

Whereas, It becomes necessary to provide conditions governing the sale and distribution of butter in the city of Chicago; therefore

Be It Resolved By the Board of Health of the City of Chicago, County of Cook and State of Illinois that:

1. It shall be unlawful for any person, firm or corporation to sell, offer for sale or have in his possession for the purpose of selling or giving away to any person or persons in the city of Chicago, County of Cook and State of Illinois any butter other than that made of cream from healthy cows from officially accredited tuberculin tested areas;

2. When butter is sold or offered for sale in the City of Chicago there shall appear on the label the following certification:

"Made of cream from healthy herds from officially accredited tuberculin tested areas";

3. The Board of Health of the City of Chicago or its authorized agents shall seize and condemn any butter sold, offered for sale or given away in the City of Chicago if said butter does not conform to the requirements set forth in sections 1 and 2 of this resolution.

Herman N. Bundesen, M.D.
President, Board of Health.
Louis E. Schmidt, M.D.
Secretary, Board of Health.

Date of publication:
Aug. 10, 1935.

2787 DEFENDANT'S EXHIBIT NO. 26.

Resolution.

The following Resolution was adopted as part of the rules and regulations of the Board of Health at its meeting on November 12, 1935:

Whereas, the present increase in the number of cases of scarlet fever in the city of Chicago is increasing the possibility of milk-borne infections, and

Whereas, it now becomes urgent and necessary for milk and milk products used in the city of Chicago to be dispensed only in unopened original containers, as received from the distributor, therefore

Be it resolved, that all milk and milk products shall be sold, served or dispensed to the final consumer only in unopened original containers as received from the distributor; and no fractional portion or part of any original package or container shall be served or dispensed for consumption, except for manufacturing purposes.

Herman N. Bundesen, M.D.
President, Board of Health.
Louis E. Schmidt, M.D.
Secretary, Board of Health.

2788 DEFENDANT'S EXHIBIT NO. 27.

Resolution.

Whereas, Section 3092 of the Mayor Kelly Milk Ordinance specifies that bacterial plate counts of milk and milk products shall be made in conformity with the latest standard methods recommended by the American Public Health Association, or any other method approved by the Board of Health, and

Whereas, A new seventh edition (1939) of standard methods of milk analysis, bearing the title "Standard Methods for the Examination of Dairy Products", has been issued by the American Public Health Association, and

Whereas, Changes in this edition, as published in the December, 1938, issue of the Journal of the American Public Health Association, include a provision that beginning July 1, 1939, tryptone, glucose, skim-milk agar be used to make bacterial plate counts of milk, and

Whereas, Experience indicates that we may expect higher bacterial counts with this medium than with the standard agar at present used for this work, and

Whereas, The standards for allowable bacterial counts, as expressed in the Mayor Kelly Milk Ordinance, were established from a consideration of the data obtained in the determination of bacterial counts with the standard agar, as specified in the sixth edition (1934) of the Standard Methods of Milk Analysis of the American Public Health Association, and

Whereas, The media recommended in the seventh edition of the American Public Health Association Standard is an enrichment media, and the bacterial counts would consequently be two, three, or more times above those obtained by methods recommended in the sixth edition (1934); therefore; be it

2789 Resolved, That until further notice the bacterial plate counts of milk and milk products be made by the Department of Health in accordance with the standard procedure as published in the sixth edition (1934) of Standard Methods of Milk Analysis of the American Public Health Association.

Herman N. Bundesen, M.D.
President, Board of Health.

DEFENDANT'S EXHIBIT NO 28 is omitted at this point as it appears in the record as the Stipulation filed June 29, 1939 in the District Court.

2800 DEFENDANT'S EXHIBIT 29.

The following Resolution was introduced by Doctor Bundesen, asking the City Council to modify the milk ordinance so that single service containers may be used in Chicago:

Since my only concern as President of the Chicago Board of Health with regard to paper containers has been to have as positive assurance as possible that fresh fluid milk can safely be delivered in such containers, and

Because the U. S. Public Health Service, whose standard milk ordinance has been adopted by the City of Chicago

has not heretofor included definite standards for the manufacture of single service containers, and

Because it was believed that we would not be acting in the best interests of safety in permitting the use of these containers until the U. S. Public Health Service had adopted suitable regulations for their manufacture and use, and

Because we have in the past followed closely the requirements of the Service, it was deemed advisable to prohibit the use of these containers in the absence of such regulations, and

Since it has now been brought to our attention that such standards have now been adopted by the Service, it is moved that

The Board of Health recommend to the City Council that Section 154-15 of the Municipal Code of Chicago be amended by adding the words "or in single service containers" after the words "standard milk bottles" in the third sentence of such section, and

That the Board adopt such standards as have been promulgated and recommended by the U. S. Public Health Service for the manufacture and handling of single service containers and which are herewith attached.

2801 U. S. Public Health Service
Washington.

October 7, 1939.

(Section 10 as it will appear in the 1939 printed Public Health Service Milk Code.)

"Sec. 10. Transferring or Dipping Milk; Delivery Containers; Handling of More Than One Grade; Delivery of Milk at Quarantined Residences.

"Except as permitted in this section, no milk producer or distributor shall transfer milk or milk products from one container to another on the street, or in any vehicle or store, or in any place except a bottling or milk room especially used for that purpose. The sale of dip milk is hereby prohibited.

"All pasteurized milk and milk products shall be placed in their final delivery containers in the plant in which they are pasteurized, and all raw milk and milk products sold for consumption in the raw state shall be placed in their final delivery containers at the farm at which they are produced. Milk and milk products sold in the distributors'

containers in quantities less than one gallon shall be delivered in standard milk bottles or in single-service containers. It shall be unlawful for hotels, soda fountains, restaurants, groceries, and similar establishments to sell or serve any milk or milk product except in the original container in which it was received from the distributor or from a bulk container equipped with an approved dispensing device; Provided, That this requirement shall not apply to cream consumed on the premises, which may be served from the original bottle or from a dispenser approved for such service. It shall be unlawful for any hotel, soda fountain, restaurant, grocery, or similar establishment to sell or serve any milk or milk products which have not been maintained while in its possession, at a temperature of 50° F. or less.

"No milk or milk products shall be permitted to come in contact with equipment with which a lower grade of milk or milk product has been in contact unless such equipment has first been thoroughly cleaned and subjected to bactericidal treatment.

"Bottled milk or milk products, if stored in water, shall be so stored that the tops of the bottles will not be submerged.

2802 "It shall be the duty of all persons to whom milk or milk products are delivered to clean thoroughly the containers in which such milk or milk products are delivered before returning such containers. Apparatus, containers, equipment, and utensils used in the handling, storage, processing, or transporting of milk or milk products shall not be used for any other purpose without the permission of the health officer.

"The delivery of milk or milk products to and the collection of milk or milk-products containers from residences in which cases of communicable disease transmissible through milk supplies exist shall be subject to the special requirements of the health officer.

"The purpose of this section is to prevent, so far as practicable, exposing the milk to contamination from the time it is placed in its container at the dairy or milk plant until the time it is delivered to the final consumer. The practice, formerly quite prevalent, of transferring milk from a bulk container located in the delivery vehicle to the household container, either by dipping or by drawing from a faucet, is dangerous because of the opportunity for contamination

by dust and flies or manually. This practice has now practically died out, but may occasionally be discovered by the inspector.

"Another practice on the part of some distributors, still occasionally observed, is the filling of returned bottles, which have not been treated with a bactericide, with milk or milk products along the milk route, particularly at retail depots. This section expressly forbids this practice.

"The use of standard milk bottles or single-service containers for delivering milk and milk products in quantities less than one gallon is required in order to prohibit delivery in such containers as buckets, fruit jars, etc., which may be difficult to wash and to subject to adequate bactericidal treatment, which cannot be filled and capped with the proper equipment used for these purposes, and which it is often difficult to label properly.

"The portion of this section dealing with the method of selling or serving of milk or milk products in restaurants, groceries, etc., is designed to prevent contamination of the milk in handling or serving. Such contamination is frequently observed in the dipping of milk from a bulk container into the container or glass in which it is sold or served to the customer, the container or glass frequently overflowing and the milk coming in contact with the fingers and then dripping back into the bulk container from which it was dipped. Furthermore, even if milk is poured into glasses from bottles in the kitchen there is more opportunity for carelessness and consequent contamination than if it is served in the original container, because the transferring is done out of sight of the customer.

2803 "The selling or serving of milk in the original container has been found to be practical. In fact, many establishments report increased sales because of the reaction of the consumer to the improved service sanitation, and to the fact that he is assured of receiving all of the cream in the original container.

"However, there are rapidly being developed sanitary bulk dispensers which may result in reducing the cost of milk distribution. For this reason this section is so worded as to permit the selling or serving of milk or milk products from approved sanitary bulk dispensers which insure correct mixing of the milk and cream. The health officer should not approve any bulk dispenser which does not satisfy the following design and operation requirements:

"(1) It shall comply with the requirements of item 10p, construction and repair of equipment.

"(2) No surfaces with which milk or milk products come in contact shall while in use be accessible to manual contact, droplet infection, dust, or flies, but the delivery orifice may be exempted from this requirement.

"(3) All parts of the dispensing device with which milk comes in contact, including any measuring device, shall be cleaned and subjected to bactericidal treatment at the milk plant, not at the retail vendor's establishment.

"(4) The dispensing device shall be filled and sealed with two seals at the milk plant in such manner as to make it impossible to withdraw any part of its contents without breaking one seal and impossible to introduce any substance without breaking the other.

"(5) It shall mix the milk and cream thoroughly and automatically with each dispensing operation. This requirement may be waived in the case of milk products which remain homogeneous without mixing.

"In the case of milk drinks mixed at soda fountains, etc., this section shall be interpreted as requiring that the milk used shall include the entire contents of the original container or shall be from an approved bulk dispenser. The sanitary control of methods used in mixing such milk drinks is considered to be within the province of a restaurant or food ordinance rather than the milk ordinance.

"In enforcing this section the health officer may make an exception in the case of cream served with coffee, cereals, etc., as in this case it is impracticable to serve in the original container because of the fact that it is impossible for the distributor to deliver cream to the establishment in the unit-size containers which would be required in each case. Furthermore, the use of expensive bulk dis-
2804 pensers as described above may not be defensible requirement for all soda fountains, restaurants, and similar establishments in the case of cream used for coffee, cereals, etc. For such service the health officer may permit transferring from the original bottle, or from a pump, urn, or other dispenser which complies with requirements (1) and (2) above, and which is filled in a sanitary manner, kept clean, and frequently subjected to bactericidal treatment complying with the requirements of item 12p.

"Bottled milk should not be submerged in water for cooling because the contraction of the contents accompanying the cooling process may create a sufficient vacuum within the bottle to suck in water around the edge of the cap. Tests have shown that milk may thus be contaminated."

Address the Surgeon General U. S. Public Health Service
U. S. Public Health Service

Washington
Sanitation Section June 27, 1939.
D. Q. Division

Public Health Service Sanitation Advisory Board Action on Single Service Containers, Etc. at June 1939 Meeting.

The following sentence is to be added to items 10p and 12r of the forthcoming 1939 printed edition of the Public Health Service Milk Ordinance:

"The manufacture, packing, transportation, and handling of single-service containers and container caps and covers shall be conducted in a sanitary manner."

The following paragraph is to be added to Public Health Reason under items 10p and 12r:

"Single-service containers, etc. which have not been manufactured and handled in a sanitary manner may contaminate the milk."

The following material is to be added under Satisfactory Compliance of items 10p and 12r:

"(5) The manufacture, packing, transportation and handling of single-service containers and container caps and covers are conducted in accordance with the following requirements. Inspections required herein may be made by the health officer or by any agency authorized by him.

(a) The buildings and rooms in which single-service containers and container caps and covers are manufactured, packed, stored, and handled shall be clean, well lighted and ventilated, and free of dust and flies, as prescribed in items 1p, 2p, 3p, 4p, 6p, 7p, 8p, and 11p.

(b) The average bacterial plate count of the stock from which single-service containers and container caps and covers are made shall not exceed 100 colonies per gram. No substance shall be present in finished single-service containers and container caps and covers which is toxic.

(c) All operations at the fabrication plant and during transportation of the manufactured articles shall be so conducted as to reduce to a minimum the possibility of contaminating the manufactured articles, as prescribed in items 13p, 14p, and 15p.

2806 (d) All of those parts of machinery and equipment with which the article being manufactured comes in contact shall be kept clean.

(e) All single-service containers and container caps and covers shall be so treated as to be as impervious to milk and milk products as practicable.

The porous condition of paraffined containers now available and the sloughing off of particles of paraffin into the product are undesirable, and manufacturers of single-service containers are urged to make every effort to provide a non-absorbent non-flaking surface.

(f) All single-service containers and container caps and covers shall prior to use be given bactericidal treatment equivalent to contact with paraffin for at least 30 seconds at at least 180° F.* in approved equipment operated in an approved manner. The bactericidal treatment equipment shall be provided with approved indicating and recording thermometers, and shall be so designed as automatically to insure the required temperature and contact time.

* This time-temperature subject to change as a result of further studies being conducted by National Institute of Health.

Address the Surgeon General
U. S. Public Health Service
(Stamp) Received Jul 5—1939 Board of Health

June 27, 1939

Dr. Herman N. Bundesen
President, Board of Health
Chicago, Illinois

Dear Dr. Bundesen:

In response to your communication of June 23, there is attached a copy of the regulations governing the manufacture, packing, transportation, and handling of single-service containers, milk bottle caps and covers, as adopted by the Public Health Service Sanitation Advisory Board at its June 1939 meeting.

Very truly yours,
Thomas Ranan
Surgeon General

CC: Dr. Haskell

2808 **DEFENDANTS' EXHIBIT 31.**

Proposed Standards for Paper Milk Containers:

The Dairy Products Section of the Chicago Board of Health reported through Dr. Arnold that experiments concerning the use of paper containers for the distribution of milk and milk products have been continued, and further studies have been made of the literature which has been published pertaining to this subject, and that, from this further study, the Dairy Products Section has formulated requirements pertaining to the use of paper containers.

Doctor Arnold stated that it was his judgment, and the judgment of the Dairy Products Section, that the use of paper containers may be permitted, without attendant hazards to the public health, when the principles of the requirements enumerated below are complied with and carried out.

Doctor Arnold also stated that the requirements enumerated below are substantially identical with the following suggestions which have previously been made by this section:

"The following general principles should be followed in the consideration of the sanitary quality of single service paper containers for milk and milk products.

The surface of the container in contact with milk shall be smooth and unbroken. The surface of the container in contact with milk shall be impermeable and nonporous.

The surface of the container in contact with milk shall be sterile or constructed of such materials that it can be disinfected in the dairy before use.

The contents of the container shall not be contaminated by microorganisms, chemicals or other substances contained in the material forming the wall."

The following proposed standards to be met by paper milk containers were prepared by the dairy inspection section and were approved by Doctor Arnold. They were submitted to the Board by Doctor Arnold, and, after discussion, motion was made by Doctor Arnold, seconded by Mr. Reynolds and carried, that it is the sense of the Board that the use of paper containers may be permitted without attendant hazards to public health when the principles of the following proposed standards are carried out:

2809 Proposed Standards To Be Met by Paper Milk Containers

1. The surfaces of paper milk containers coming in contact with milk shall be impermeable and non-porous, and shall be smooth and unbroken. Paraffin-immersion treatment, as employed at present, is not considered as meeting this definition.

2. The surface of the container in contact with milk shall be sterile or constructed of such materials that it can be disinfected in the dairy before use.

3. The material forming the surface shall be inert and

of such composition that it will not react with milk, or "flake-off" into the milk. No toxic material which may be deleterious to health shall be present in paper, moisture-proofing materials, adhesives or other materials used in the manufacture or subsequent treatment of paper milk containers.

4. Containers shall be made from virgin pulp or other suitable material and such board or material, prior to moisture-proofing, shall not have a bacterial count exceeding 500 colonies per gram.

Paper and similar materials to be used in the fabrication of milk containers shall be manufactured under the supervision and inspection of an official agency such as the United States Public Health Service. Such materials shall be manufactured under sanitary conditions and the plant, surroundings, equipment and method in paper
2810 mills and conversion plants shall meet the requirements of the United States Public Health Service for grade A milk plants.

Paper rolls, packages or boxes in which milk containers or materials for fabricating milk containers are shipped shall bear an approval stamp of the official inspection agency and such stamp shall identify, by number or other approved method, the source of the product.

Only water meeting the Federal standard for safe drinking water shall be used in the treatment of pulp or other materials and in any subsequent treatment of containers.

Unless used immediately after manufacture, container blanks shall be wrapped, sealed and protected from contamination until used. When used the outside sheet on rolls or the top and bottom sheets of sheeted stock shall be discarded in all cases.

5. All stock and containers shall be handled mechanically in the conversion plant as far as possible. Following fabrication, until final filling and sealing in the milk plant, container surfaces with which milk or milk products come in contact shall be protected from contamination.

6. Throughout the processes of printing, folding, sealing, adhesive application, or packing prior to shipment to milk plant, all stock and containers shall, as far as
2811 feasible, be handled mechanically and be suitably wrapped or packaged before shipping.

Packaged container stock at milk plants shall be kept in a clean, dry place and opened only for immediate use. Where it is necessary to form or manipulate containers,

all surfaces with which milk or milk products may come in contact, shall be protected from human handling.

7. The gluing or sealing of container board shall be accomplished by means of non-fermentable adhesives. Adhesives must not contaminate containers in any manner, nor contain any substance in amounts detrimental to health.

8. Cases for shipping empty containers shall be constructed of board or wrapping designed adequately to protect containers from injury or abuse due to tearing or breaking. Containers shall be stored in sealed, dry, unbroken cases, in a dry, vermin-proof location. Partly empty shipping cases of prefabricated containers shall be resealed, rewrapped, or otherwise protected from contamination during storage. Empty containers shall not be exposed to contamination at any time.

The opening of shipping cases and the storing of containers shall be done in a room separate from other milk handling equipment.

9. Equipment used for moisture-proofing, bactericidal treatment, filling or otherwise handling paper or similar materials to be used for milk containers shall conform to the requirements of the United States Public Health Service for milk handling equipment used in grade A milk plants.

10. In the filling and handling of the container, milk shall be so handled to prevent adulteration, and the contents of the container shall not be contaminated by microorganisms, chemicals or other substances contained in the material forming the wall.

May 11, 1939.

2475 And on, to wit, the 27th day of April, A. D. 1940 came the Defendants by their attorneys and filed in the Clerk's office of said Court their certain Objections to Depositions in words and figures following, to wit: Filed Apr. 27, 1940.

2476 IN THE DISTRICT COURT OF THE UNITED STATES.
• • (Caption—316) • •

OBJECTIONS TO DEPOSITIONS.

Filed Feb. 14, 1940. Jacob I. Grossman, Master in Chancery.

The defendants object to the following portions of the depositions offered in evidence in this case upon the grounds stated below:

1. To all testimony contained in the depositions taken in New York City on April 25, 1939 and at Philadelphia, Pennsylvania on April 27, 1939, which pertains to the use of paper containers for milk in municipalities other than the City of Chicago, upon the ground that such testimony is neither relevant nor material to any issue in this case.

2. (a) To plaintiff's Exhibits 5, 6, 7, 8 and 10 (letters identified during the taking of depositions at Philadelphia on April 27, 1939) because each of said exhibits is incompetent in that it contains statements of the opinion of the respective writer concerning the sanitary qualities of paper milk containers. These statements and the ex-
2477 hibits containing them constitute secondary and hearsay evidence and their admission would deny to the defendants their right of cross-examination.

(b) Said exhibits were identified and offered as permits received from various municipalities. It appears from the face of each of the exhibits that they are not such permits but are letters written at the solicitation of a witness for the plaintiff. (Philadelphia Deposition, pp. 66-72.)

Barnet Hodes,
Corporation Counsel.
Walter V. Schaefer,
Assistant Corporation Counsel.
Charles P. Horan,
Assistant Corporation Counsel.
Attorneys for Defendants.

Filed Apr. 27, 1940. 2452 And on, to wit, the 27th day of April, A. D. 1940, there was filed in the Clerk's office of said Court a certain Master's Report in words and figures following, to wit:

2454 IN THE DISTRICT COURT OF THE UNITED STATES.

* * (Caption—316) * *

MASTER'S REPORT.

Pursuant to the reference I held hearings at which the following were present: Messrs. Gariepy & Gariepy, by Mr. Fred A. Gariepy, representing the plaintiff, and Mr. Barnet Hodes, Corporation Counsel of the City of Chicago, by Messrs. Walter V. Schaefer and Charles P. Horan, Assistant Corporation Counsel representing the defendants. At the same time, the evidence was being taken as a deposition in the case of Ex-Cell-O Corporation *vs.* City of Chicago, et al., D. C. No. 456, pending in this court. The attorneys for the plaintiff in that case were Messrs. Eckert & Peterson and Mr. Owen Rall, who appeared by Mr. Owen Rall.

2455 Plaintiff asks for an injunction to restrain defendants, the City of Chicago and the Board of Health of the City, from interfering with plaintiff's sale of milk in Pure-Pak paper milk containers. It also asks for a declaratory judgment that paper milk bottles are "standard milk bottles" within the meaning of the Chicago Milk Ordinance, so that the ordinance does not prohibit the use of said containers; and, in the alternative, if those containers are not standard milk bottles and are prohibited, that the ordinance and regulations thereunder are invalid.

Plaintiff applied for a permit to use single service containers in Chicago. The Board of Health neither granted nor denied the application. In July 1938, on the ground that the safety of paper containers had not yet been established, the Board stated to plaintiff that it was waiting the recommendation of the United States Public Health Service, whose model ordinance and advice furnish the lead for municipalities throughout the country (Stipulation, quoted in ptfs. brief pp. 18-19). Plaintiff, having asked in January 1939 for a permit, filed this suit in Feb-

ruary 1939. In June 1939 the Sanitation Advisory Board of the United States Public Health Service made a report (Ptfs. Ex. 61) in which among other things it recommended that the model ordinance should be amended so as to include paper containers in addition to standard milk bottles. In that report, however (p. 3), the Board included a criticism of paper containers, as follows:

"The porous condition of paraffined containers now available and the sloughing off of particles of paraffin into the product are undesirable, and manufacturers of single-service containers are urged to make every effort to provide a non-absorbent non-flaking surface."

In October 1939 the United States Public Health Service amended its model ordinance to add paper containers (Ptfs. Ex. 92; Defts. Ex. 29; Rec. 1567). Thereafter on October 16, 1939, the Chicago Board of Health recommended to the City Council similar action.

In the meantime hearings in this suit had begun and were being held at such times as expert witnesses from other states could appear. The defendants' case was closed on October 13, 1939. On October 16, 1939, the Board of Health made its recommendation to the City Council. On October 19, 1939, defendants requested and were granted leave to reopen proofs and submit further testimony. Accordingly on October 23rd the defendants offered further evidence and again closed their case. The plaintiff completed its proofs on October 26th. The recommendation of the Board of Health was referred by the Council to its Committee on Health. While the matter was under consideration by the Committee, plaintiff's brief was not filed before me. On November 22, 1939, the Committee on Health voted to defer action upon an amendment to the ordinance pending the outcome of this case. Thereafter briefs were filed in the case at bar,—the plaintiff's brief on December 19, 1939, the defendants' brief on January 27, 1940, and the plaintiff's reply brief on February 15, 1940. Further proceedings were had in the case on March 9, 1940, the transcript of which is made a part of the record. Additional memoranda based upon those
2456 further proceedings were filed on March 15, 1940, and on April 13, 1940. On April 26, 1940, the record was reopened for the purpose of formally incorporating certain facts pertaining to the action of the City Council. The record consists of 2214 pages which I certify as com-

plete, true, and correct, and a number of exhibits, which are herewith transmitted.

Plaintiff is a Michigan corporation licensed to do business in Illinois. It has a milk plant at Chemung, Illinois, and sells milk at wholesale and at retail in a number of cities and villages in Illinois. In quantities of less than one gallon it delivers its milk only in Pure-Pak paper containers and does not use glass milk bottles. In the expectation that it would be permitted to use its paper containers for the sale of milk in Chicago, it obtained contracts for such sale in Chicago, and, in order to fulfill the contracts, it purchased a number of milk trucks and other equipment, and made contracts with milk producers for a large supply of milk. On account of its inability to sell the milk in paper containers in Chicago, it has been unable to use it trucks and equipment which as a consequence have suffered a large depreciation in value, it has had to take large losses on the milk supply which it had contracted to purchase, and has lost the profit which it would have made from such sales in Chicago.

I find that the matter in controversy exceeds, exclusive of interest and costs, the sum or value of $3,000 and is between citizens of different states, and that the court has jurisdiction of the subject matter and the parties.

Section 3094 of the Revised Chicago Code (Defts. Ex. 24, p. 76) provides (italics added):

"* * * All pasteurized milk and milk products shall be placed in their final *delivery* containers in the plant in which they are pasteurized, and all certified milk and milk products sold for consumption in the raw state shall be placed in their final *delivery* containers at the farm at which they are produced. Any milk or milk products sold in quantities of less than one gallon shall be *delivered* in *standard milk bottles; provided, however,* that nothing herein contained shall be construed to prohibit hotels, soda fountains, restaurants, and similar establishments from *dispensing* milk or milk products from sanitary *dispensers* approved by the board of health."

The issues are whether plaintiff's paper container is a "standard milk bottle" within the meaning of the Chicago Milk Ordinance, and, if not, whether the ordinance is invalid. Both parties take the position that if the paper container is not a standard milk bottle, the ordinance prohibits the use of paper containers.

A paper container is not a "standard milk bottle":

Plaintiff's container is a prismatic box about 6½ inches high and 4½ inches wide, with a gable top, made of paper and paraffined on the inside and outside (Rec. 508). In the middle of one of the slanting surfaces of the gable top is a so-called pouring lip which is about an inch square and which is pulled out like an ear when milk is to be poured out of the container.

On January 4, 1935, when the ordinance was passed, the standard milk bottle was, and up to the present time in Chicago has been, made of glass. Glass milk
2457 bottles have constituted a distinct and definite class of bottles (see Report of U. S. Biennial Census of Manufacturers for 1935, quoted in defts. brief p. 9). Dr. Tracy, plaintiff's witness, testified that if he were selling milk at retail in Chicago, the term "standard milk bottle" would mean to him a glass milk bottle of a certain size and shape (Rec. 681-4). Its shape has certain general characteristics, of which courts will take judicial notice,—narrower at the top than at the bottom and bulging to its full width at about the middle of the bottle. It is quite apparent that a person of average intelligence would experience no difficulty in selecting a milk bottle from an array of other bottles.

On the other hand, paper containers are of comparatively recent development and were not in contemplation at the time the ordinance was passed. To classify plaintiff's paper container as a "bottle" would require considerable straining of the definitions of a bottle.

The general understanding of standard milk bottles has always been that they are of the familiar shape and are made of glass. This is reflected by the rules and regulations approved by the United States Public Health Service and by the City of Chicago for the filling and cleaning of milk bottles. One of the reasons stated (Defts. Ex. 24, p. 77) for requiring standard milk bottles was the difficulty of washing other containers and subjecting them to bactericidal treatment. Washing must have reference to a glass milk bottle. The report of the Chief of the Bureau of Animal Industry to the Secretary of Agriculture dated September 1, 1938, shows clearly a distinction between the glass milk bottle and the single service paper container (Stipulation, Rec. 1027-49, copied in ptfs. main brief, p. 14). That report also shows that up to its date, September 1,

1938, paper containers were not being used to any extent in delivering milk to homes.

Plaintiff itself has distinguished between bottles and paper containers. In the original application to the Board of Health, plaintiff asked to present the facts regarding delivery of milk "in paper containers instead of bottles" (Defts. Ex. 22). The sales-manager of Ex-Cell-O Corporation which manufactures the Pure-Pak container, in a letter to the Board of Health dated August 2, 1938, stated that the Code and Ordinance of the United States Public Health Service were written a great many years ago and would not include the present, more sanitary receptacle—because it was then unknown (Defts. Ex. 23, p. 2, quoted in defts. brief pp. 12-13).

I find that the standard milk bottle specified in the ordinance is a glass bottle of the type, shape and proportions well-known to the trade and the community in Chicago as having been used for many years for the delivery of milk at retail. I also find that plaintiff's paper container is not a standard milk bottle within the meaning of the ordinance.

Validity of the ordinance:

I shall first dispose of two contentions that the ordinance is invalid for indefiniteness and for delegation of legislative power. I shall then deal with the contentions based upon alleged unreasonableness, deprivation of property without due process, and discriminatory enforcement.

2458 It is insisted that the ordinance is invalid because it does not define what constitutes a standard milk bottle, and that the ordinance thus contains an invalid delegation of legislative power. I find that the phrase "standard milk bottle" is self-definitive. The only thing that the ordinance leaves to be done is the ascertainment of a fact. As hereinabove suggested, what constitutes a standard, customary, or ordinary milk bottle is a fact which may even be judicially noticed. Such enactments are valid (e. g., *People* v. *Flaningam*, 347 Ill. 328, 333-5, and cases cited, "moral character"; *Proffitt* v. *County of Christian*, 370 Ill. 534. See also *U. S.* v. *Chemical Foundation, Inc.*, 272 U. S. 1, 12 "in the public interest"; *Buttfield* v. *Stranahan*, 192 U. S. 470, 491, 493, 496 (standard of purity, quality and fitness for consumption)).

It is also urged that the requirement for delivery in "standard milk bottles" must fall on account of the al-

leged invalidity of the proviso that that requirement shall not prohibit hotels, soda fountains, restaurants, and similar establishments from dispening milk or milk products from "sanitary dispensers" approved by the Board of Health. The whole section up to the proviso refers to the delivery of milk; the proviso refers to dispensing of milk from sanitary dispensers. These dispensers contained the milk in bulk, which was to be poured into a glass to be served to the patron (see Defts. Ex. 29, U. S. Public Health Service bulletin, p. 3, par. 2). The thought behind the proviso apparently was that in the case of restaurants and other such places where milk was consumed upon the premises, the milk might be considered as delivered upon its arrival at such place, and that the subsequent dispensing of the milk from the large container into glasses for service to the patrons in the place should not be considered as another delivery, but that the milk should be dispensed from sanitary milk dispensers. The theory was that if the dispenser were sanitary, the chances of contamination of the milk in such cases would be so much less than in the case of transfer from one container to another between pasteurizing plant or farm and the place of delivery, as to warrant the classification. I cannot say that this was not a reasonable basis for classification (cf. *Block.* v. *City of Chicago,* 239 Ill, 259, 261).

Neither can I say that there is a delegation of legislative power to the Board of Health in the matter of approving "sanitary dispensers" from which restaurants and other such places may dispense milk. The ordinance has prescribed definitely that such dispensers must be sanitary. That is a mere detail, a fact to be ascertained and maintained by the Board of Health. The Board is not in my opinion given legislative power by this proviso (see *People* v. *Flaningam,* 347 Ill. 328, 333-5, and other cases cited supra; and *Mayor* v. *Bloecher & Schaff,* 132 Atl, 160 (Court of App. of Md.) ("sanitary")).

Furthermore, since plaintiff herein does not come within the classification of restaurants and other such places, and has not as a member of such class applied for and been denied a permit for a sanitary dispenser, I find that the plaintiff is in no position to complain of the alleged invalidity of the proviso.

2459 I cannot say that the City Council would not have passed the section without the proviso. The proviso seems to me to be a mere guard against misinterpretation

of the section. It might well be that, even without the proviso, the serving of milk by a restaurant to its patrons would not be considered as a "delivery" of milk within the meaning of the ordinance.

Moreover, at all times since plaintiff applied for a permit in this case, the Board of Health had in effect a resolution adopted on November 12, 1935, concerning the sanitary dispensers which it would approve under this proviso (Defts. Ex. 26). That resolution provides "that all milk and milk products shall be sold, served or dispensed to the final consumer only in unopened original containers as received from the distributor; and no fractional portion or part of any original package or container shall be served or dispensed for consumption, except for manufacturing purposes." It seems to me that the question here raised is moot, in that no actual discrimination or prejudice to this plaintiff has yet been shown (e. g., *Jewel Tea Co.* v. *City of Troy*, 80 F. (2d) 366, 368-9 (CCA 7)).

I accordingly find that plaintiff's contentions based upon alleged invalidity of the proviso should be overruled.

This brings us to the important issue whether the ordinance is a legitimate exercise of the police power.

The controlling principles are well established. An act under the police power may not be arbitrary but must have a reasonable and manifest relation to the protection of the public health, safety or welfare. It must be an appropriate means and adapted to the object sought (*Jones* v. *Portland*, 245 U. S. 217, 256; *Pacific States Box & Basket Co.* v. *White*, 296 U. S. 176, 182; *Koy* v. *City of Chicago*, 263 Ill. 122, 130-1). In health measures (*Gundling* v. *City of Chicago*, 176 Ill. 340, 349), particularly those relating to milk, great latitude is given to the legislative body (*Koy* v. *City of Chicago*, 263 Ill. 122, 130-1; *Lieberman* v. *Van de Carr*, 199 U. S. 552, 561-2).

In the Koy case the court declared that regulation of the sale of milk is "an imperative duty" in order that the milk shall not only be free from disease but shall be pure and wholesome, and that the power to regulate extends not only to the health and keeping of the cows but also to the character of the receptacles in which milk is contained. The court also said that the object is the preservation of public health, and, as a means to that end, protection of the public against "dishonest vendors of milk."

It may be observed that the "means" which may be dealt with need not itself be a source of disease or peril

to health. The police measure is not necessarily narrowly confined to health, but may be enacted for the more general purpose of the public welfare.

Before an act will be held unconstitutional, its invalidity must palpably and unmistakably appear (*Schmidinger* v. *City of Chicago*, 226 U. S. 578, 588-9, affirming 245 Ill. 317). This rule of decision has also been somewhat differently phrased, that is to say, that the invalidity must appear beyond a reasonable doubt (*People* v. *Brady*, 272 Ill. 401, 407; *Joel* v. *Bennett*, 276 Ill. 537, 539), and that the invalidity must be "entirely free from doubt" (*United*
2460 *States, ex rel* v. *Quincy*, 4 Wall. 536, 549). The attack must fail if there is a conceivably rational ground on which the legislative body may have based its judgment (*Pacific States Box & Basket Co.* v. *White*, 296 U. S. 176, 182; *Sinking Fund Cases*, 99 U. S. 700, 718).

If the power to regulate exists, it is a matter of legislative judgment whether there shall be entire suppression rather than regulation (*Powell* v. *Pennsylvania*, 127 U. S. 678, 685; *Price* v. *Illinois*, 238 U. S. 446, 452). A valid general regulation or prohibition affecting a class of persons or things is not rendered invalid because a particular person or thing, belonging to the class, considered alone, is harmless. Thus in *Hacker* v. *Barnes*, 166 Wash. 558, 7 Pac. (2d) 607, the court held that the fact that the plaintiff's cattle were healthy did not constitute a reason for enjoining against the tuberculin test. In *City of Milwaukee* v. *Childs Co.*, 217 N. W. 703, the Wisconsin Supreme Court sustained an ordinance requiring the sale of milk in original containers even though defendant's dispensing method was as sanitary as that prescribed by the ordinance. See also *Hebe* v. *Shaw*, 248 U. S. 297, 303.

If there may be a reasonable difference of opinion, the legislative judgment controls (*Price* v. *Illinois, supra; Hebe* v. *Shaw, supra*). Thus enactments requiring vaccination or tuberculin tests have been sustained, notwithstanding evidence by objectors that such inoculations were in fact harmful and injurious (*Jacobson* v. *Massachusetts*, 197 U. S. 11, 30-1; *Adams* v. *Milwaukee*, 228 U. S. 572, 582, 583-4).

In *Laurel Hill Cemetery Co.* v. *San Francisco*, 216 U. S. 358, 365, the court in an opinion by Mr. Justice Holmes upheld an ordinance prohibiting burial within the city and county limits. The opinion went so far as to say:

"If every member of this bench clearly agreed that

burying grounds were centers of safety, and thought the Board of Supervisors and the Supreme Court of California wholly wrong, it would not dispose of the case. * * * Opinion still may be divided, and if, on the hypothesis that the danger is real, the ordinance would be valid, we should not overthrow it merely because of our adherence to the other belief. Similar arguments were pressed upon this court with regard to vaccination, but they did not prevail. On the contrary, evidence that vaccination was deleterious was held properly to have been excluded. *Jacobson* v. *Massachusetts*, 197 U. S. 11; see *Otis* v. *Parker*, 187 U. S. 606, 608, 609."

Legislation must be sustained, even if the rational ground therefor is established by less than a preponderance of the evidence, and even if the court from a preponderence of the evidence may reach an opposite judgment.

I shall now state my findings and comment upon the significance of the many steps in the manufacture, processing, and filling of paper containers. I shall also state my findings and comment upon the six particulars or characteristics which the City's brief sets forth as sufficient basis for legislative prohibition. The City's six divisions are:

Paper containers are absorbent;

Paraffin from the paper containers gets into the milk;

Paper containers are not sterile; they do not receive effective bactericidal treatment before they are filed with milk;

2461 Paraffin oxidizes at high temperatures, so that an odor is imparted to the containers;

Effective sanitary control of paper containers requires supervision and control of all processes in the manufacture of paper and its conversion into containers;

Paper containers are not transparent, and the cream does not rise to the top in them.

Manufacture, processing, and filling of paper containers:

The paper board is made in paper mills usually near wooded areas, in states other than Illinois. The paper for plaintiff's Pure-Pak container is made at the Cherry River mill in West Virginia. Three types of material are used for containers (Rec. 80): prime pulp, which is used in the manufacture of containers for milk and dairy products; a second class, not necessarily prime, which is high

grade, which may be used for containers of dried food, such as breakfast food; and a third class, called the waste paper class, consisting of material collected from unknown sources, used in the manufacture of boxes such as shoe boxes. The evidence is that plaintiff's paper board is made out of prime spruce pulp.

The logs for the prime spruce pulp are cut, washed, chipped, and placed in chemical digesters containing a cooking acid. The chips are digested under high steam pressure. This removes the encrusting materials. The cooking liquor is then washed out and the pulp is washed and then bleached to whiteness. The water is pressed out and the fibers are disintegrated in water. At Cherry River mill, chlorine, which has the effect of a bactericide (Rec. 100-1) is placed in the water (Rec. 64). Water is such an important part in the making of pulp and paper, that water should not contain bacteria. The pulp is further diluted in the machine with water which according to the record is sterile at Cherry River mill (Rec. 64).

The fibrous material then goes to a machine where the fibers are webbed or matted together and the water drawn from the fibers. The matted fibers then go over a series of steam heated cylinders or rolls, which at their surface are about 360° F. The temperature of the surface of the paper board in contact with the heated cylinder is between 175 and 200° F. The moisture of the paper board is thus reduced, but the paper board still contains some moisture.

As the paper board comes off of the machine, it is sprinkled with water (which at Cerry River is chlorinated) and ironed out to give it a gloss. It is then either rolled or cut into flat sheets, and wrapped in clean paper and sealed. At Cherry River, the paper board is then transported to a freight car which has been cleaned and lined with paper, and shipped to the converting plant of the Gardner-Richardson Co. at Middleton, Ohio, which cuts and trims the flat paper and prints on it as directed (Rec. 124).

The evidence is that at the Cherry River mill the employees engaged in the operations observe sanitary precautions as to clean hands and behavior; that there are numerous hand-washing facilities close to the operations; that the pulp and stock are mechanically handled, and the paper board is not allowed to come in contact with

2462 the floor; and that the paper board does not come into manual contact other than as may be necessary for adequate inspection.

In the case of Cherry River paper board, the Gardner-Richardson Company sends some of it to plaintiff's dairy ready for use in the Ex-Cell-O machine. That machine forms, paraffins, and fills the container (Rec. 87). As part of the filling process at plaintiff's dairy, the paper board receives a paraffin bath of fully refined paraffin at a temperature of from 172 to 176° F. The primary purpose of the paraffining is to provide moisture-proofing for the paper container (Rec. 85). In addition, the paraffining may act as an additional sanitary safeguard in that certain bacteria may be killed by the temperature of the melted paraffin (Rec. 85-6). However, paraffining will not kill all of the bacteria in the paper (Defts. Ex. 28, p. 2). It is also possible that the paraffing seals in any organisms that may be within the paper board (Rec. 86). On a hot day the paraffin on the board may become soft. Paraffin is shipped in slabs contained in burlap bags which are lined with muslin or some clean material. That paraffining does not effectively sterilize is confirmed by the recognition of the importance of sanitary conditions at the mill.

Two men are used on plaintiff's Ex-Cell-O machine for processing or filling in the paper board blanks and turning out the finished containers of milk. From the time the blanks are inserted in the machine until they come out sealed and filled with milk, the only manual handling is when the blanks are placed in the machine and after the containers have been filled, sealed and stapled and are ready for delivery (Rec. 90). The wire used in the containers is heated to a high temperature at the time it is inserted (Rec. 90). Ordinary sanitary precautions are taken as to the employees.

Facilities are provided for dismantling certain portions of the machine for purposes of cleaning (Rec. 91).

One of the methods of testing paper is the disintegration method which, briefly, is cutting the paper board into sections and placing them into sterile dishes. The paper is kept as sterile as possible for the test and the cutting instruments are sterile. The sections are then placed in sterilized water. Without going into further detail, by this method the bacterial content of the paper board can be determined (Rec. 84).

Another method is the rinse test, which is the test used

on glass bottles. Sterile water is introduced into a container for the purpose of rinsing organisms from the walls of the container, and taking out by bacteriological means the rinse water and counting the bacteria (Rec. 103).

Dr. Sanborn, as a result of 350 tests on Cherry River paper board received since January 1, 1939, at the laboratory in Geneva, New York, in the early part of 1939, testified that the shipments, collected under bacteriological control and shipped to the converters, were essentially sterile (Rec. 69). He testified that out of 240 tests made over a period of two years from June 1937, 88% showed less than 100 colonies per gram of disintegrated paper board. He stated that through research, 500 colonies
2463 per gram has been suggested as a safe maximum (Rec. 70). The regulation suggested in the recent amendment by the United States Public Health Service is 100 colonies per gram (Defts. Ex. 29, p. 6, par. 5b).

Dr. Sanborn testified that in his experiments he had not found any pathogenic (disease-producing) bacteria in paper board (Rec. 95), and that the paper board when it leaves the Cherry River mill does not contain enough moisture for pathogenic or other bacteria to live on (Rec. 97), that is, to develop and multiply, but does contain enough to enable them to continue to exist (Rec. 222-3). He testified that upon storage in a factory or warehouse at a temperature of 70° F., under sanitary conditions, the bacterial count in paper board would decrease (Rec. 99).

Much of this testimony was corroborated by other experts.

Dr. Prucha, one of plaintiff's witnesses, a bacteriologist on the staff of the University of Illinois, testified that the paper board was self-purifying, in that as the moisture in the paper board evaporated both as it went over the hot rollers and afterwards, bacteria, which must have moisture to exist and multiply, would tend to disappear (Rec. 1074). He testified that on account of this self-purification and the heating and drying to which the paper was subjected, it was immaterial whether the water at the mill was contaminated or not; that as far as he was concerned it would make no difference whether the water used had been taken from the Sanitary District channel in Chicago (Rec. 1074). Later, however, he testified that such water should not be used, as it might have a public health significance (Rec. 1193). And he also gave testi-

mony that bacteria including the non-spore forming disease producers, might remain in the paper for some time after it had been manufactured (Rec. 1194-99).

Dr. Tracy, one of plaintiff's witnesses, also on the staff of the University of Illinois, testified among other things that he considered the Pure-Pak container a "sanitary" container but not a "sterile" container (Rec. 701).

Dr. Woodman, Chief of the Health Department of Evanston, plaintiff's witness, tested 100 of plaintiff's containers. While he found that as much as 7% of them contained more than the permitted maximum of 1000 colonies of bacteria per quart (Rec. 1002), he also found 12 with 500 to 1,000; 20 with 100 to 500; 29 with less than 100; and 33 sterile. Other plaintiff's witnesses testified that their tests showed results within the permitted maximum; that the bacteria found in paper board were spore-forming aerobic organisms (living on organic material), were not pathogenic (Rec. 517), and presented no health problem (Rec. 520, 542).

Dr. Tracy testified that the bacteria pick-up on paper container machines used for filling was no greater than that found on glass bottle machinery (Rec. 735), and that the sterilization process on glass bottles, like the paraffining on paper containers, was not perfect (Rec. 739). However, he also testified that in experiments with 162 glass bottles which had been washed in apparatus operated essentially as in the City of Chicago he found no more than 600 colonies per bottle as compared with
2464 the permitted maximum of 1000 per bottle. The only basis of comparison between glass bottles and paper containers is after glass bottles have been washed. Upon completion of manufacture and before use, glass bottles are absolutely sterile, while paper board is only "essentially" sterile (Sanborn Rec. 72).

On the other hand, defendants, dealing with the subject of paper containers as a class, rely on evidence emphasizing possible sources of contamination and health hazards on account of variations from ideal procedure which might be found in mills generally (e. g., Rec. 1725 et seq.; Sanborn, 125). Thus there was testimony to the effect that the condition of the physical equipment of the mill might present sources of contamination; the vats might be of rough surface cement as opposed to tile, so as to give opportunity for the adhesion of a substantial amount of pulp which would furnish a breeding spot for bacteria;

the pipes might be of iron instead of copper, which might have a somewhat similar effect; the artificial blower or drying system might not be adequate, so that there might be contamination from the air, dependent upon the direction of the wind and upon atmospheric conditions; the water used on the driers might not be sterile; if a mill making containers for milk also made other types of containers in which inferior pulp was being used, there might be a residue of the inferior material which might mix with the pulp used for milk containers. It was also suggested that paper in transit might not be adequately protected from dirt or from moisture.

I find that the evidence is such that a legislative body might reasonably conclude that at one or more of the many steps and stages from the pulp to the sealed container, contamination might occur through carelessness, desire to save expense, inadequate facilities, or other reason.

Absorbency of paper containers:

The possibility of bacteria getting into the paper board has no significence unless such contamination can get into the milk in the finished container. I find that despite the paraffining, the finished paper containers are absorbent (Dr. Prucha, Defts. Ex. 28; Rec. 1234; Dr. Tracy, Rec. 728; U. S. Public Health Service statement, Ptfs. Ex. 61, p. 3, and that such bacteria as may be contained in the walls of the paper containers may thus get into and spread through the milk. Experiment 1, Defts. Ex. 28).

I find that there is evidence tending to show that the walls of the finished container may contain bacteria. Plaintiff's witness Dr. Sanborn testified on direct examination (Rec. 116-18) that the sanitary condition of the paper board blank determines the sanitary condition of the finished container; that paper with high bacterial counts will result in finished containers with high bacterial counts; that it is essential that the paper board have a low bacterial count. The paraffining is not an effective sterilizing agent.

Dr. Tracy, another of plaintiff's witnesses, testified that the condition of the mill is a significant factor in the condition of the finished paper container; that the sanitary condition of the water used in the paper mill bears
2465 a relation to the sanitary condition of the finished container; that dirty contaminated paper board must

never be used, because bacteriological tests on such board, even after the board has been well paraffined, are not satisfactory; that tests made of the water at two paper mills engaged in making paper for milk containers showed the presence of sewage or intestinal bacteria (Rec. 706-9). One of these was the unchlorinated water at the mill at which the paper for plaintiff's containers is manufactured, but the chlorinated water used by that mill was free of bacteria (Rec. 708).

With the best method of sterilization, it is possible to obtain a sterile glass bottle. On the other hand, I find that on the basis of the above evidence, a legislative body might reasonably be of the opinion that there is some danger that the walls of the finished paper container may contain bacteria, and that, by reason of the absorbency of the container walls, even when paraffined, the baeteria may get into the milk. The amount of absorbency is unimportant, the weight to be given for the determination of the legislative body (*City of Chicago v. Arbuckle Bros.*, 344 Ill. 597, 604-5).

Paraffin particles in the milk:

I find that there is a sloughing off of particles of paraffin into the milk (U. S. Public Health Service statement, Ptfs. Ex. 61, p. 3, quoted ante p. 3; Ptfs. witness Dr. Tracy, Rec. 727, 716-17; Defts. witness Martinek (1612-13). Dr. Black, a pediatrician, testified that he preferred to have milk for children not adulterated with paraffin; that in the handling of babies even the appearance of evil is to be avoided. On this subject plaintiff introduced evidence to show that paraffin was not harmful, and that the particles were so small as to be unimportant. The question here is not what the court may think regarding the harmfulness of such foreign substance in the milk. I find that the legislative body entrusted with the "imperative duty" (*Koy* v. *City of Chicago*, 263 Ill. 122, 130-1) of seeing to the purity of milk might, in view of this evidence, not unreasonably refuse to permit such foreign substances in milk, especially in milk for babies (by statute in Illinois the addition of "any" foreign substance to milk is forbidden: Ill. Stats. Ch. 38, par. 14).

Odors from paraffin or bacteria:

The city contends that paraffin oxidizes at high temperatures, with the result that an odor is imparted to the

paper containers and the milk therein. The City refers to the testimony of plaintiff's witness Keyser that oxidation of paraffin begins at a relatively low temperature and that the nature of the products of oxidation is acid (Deposition 27-8). Dr. Sanborn, another plaintiff's witness, when asked whether the container had been paraffined (Rec. 299-300), smelled it. He explained that paraffin may sometimes be heated too hot and that in such case certain products of decomposition may be detected. In that connection he mentioned that if the paraffin in the paraffin bath is not renewed and kept fresh, overheating is likely to occur at a lower temperature than with fresh paraffin; that if the paraffin in the bath is permitted to remain for two or three weeks without change and cleaning the tank, the paraffin may take on an off color and an odor (Rec. 318-20).

2466 The City makes the point that milk absorbs odors and if paraffin is allowed to get into such state the purity of the milk may be affected. It also makes the point that if paper board contains a high count of bacteria, such bacteria may not only be disease-producing but may give off very objectionable odors which may be absorbed by the milk (testimony of Dr. Rice, Rec. 527-32).

On the other hand, plaintiff contends that pure clean paraffin is harmless; that in fact plaintiff's container does not have such odors. It refers to the testimony of Howard R. Peterson (Rec. 1489-93) to the effect that paraffin oxidizes at 210° F., and even then only after twenty-four hours; that the fresh paraffin used has a sweet odor, free from any trace of rancidity; and that a paraffined milk container left in the sun will not permit of oxidation unless it be left there for many hundreds of hours. Plaintiff contends that the paraffin used in the Ex-Cell-O machine at plaintiff's plant is changed daily; that there is no public hazard if the sweet odor gets into the milk, and that there is no testimony that the oxidation of paraffin has any harmful effect.

Here again we have a conflict of views. I find that the City Council in prohibiting paper containers might conceivably have taken into consideration, along with other items, possible staleness of the paraffin, oxidation of the paraffin, and the possibility of rancid odors from oxidized paraffin being imparted to the milk. Since the duty of the City is not only to protect against disease-producing milk but also to insure pure unadulterated milk, I find that the City Coun-

cil may also have taken into consideration even the so-called sweet odors of pure paraffin and have decided that milk should not have a foreign odor, whether rancid or sweet and whether harmful or not. I also find that the City Council, in its effort to insure purity of milk, may likewise have been influenced to some extent by the possibility of objectionable odors from large counts of bacteria in the paper getting into the milk.

Effective Sanitary Control of Paper Containers:

As is apparent from the description of the various steps in the manufacture, transportation, processing and filling of paper containers, the sanitary condition of various paper mills may vary from time to time as either natural conditions change or the required precautions are not maintained. Economic considerations may influence relaxation in such precautions (Rec. 191-206).

Dr. Sanborn, plaintiff's witness, testified that, without knowledge and control of the sanitary conditions at the mill, rinse tests might be misleading (Rec. 232) and even disintegration tests alone might not always be relied upon (Rec. 188-9, 214), and that in the interest of public health, standards governing the production, processing and handling of paper board until filling of the container, should be adopted by public health authorities (Rec. 210-11).

In an address by Dr. Prucha in October, 1937, to milk sanitarians, he emphasized that they should inspect paper mills and check on the pulp and the water because some mills might not have proper control over contamination in water supply; that medical examination of the workers handling and packing the paper should be required; and that
2467 the plant where the paper is cut and printed should be inspected and visited (Ptfs. Ex. 62, pp. 1, 2).

Dr. Sanborn also testified (Rec. 224-5) that a consistently high standard of quality of paper depended largely upon constant voluntary adherence by the mills themselves to an adequate micro-biological control; that that would be the only means of control, unless laboratory tests by qualified bacteriologists within municipalities were made sufficiently comprehensive and complete so that the test of the finished product received in a municipality might be considered an index to the sanitary condition of manufacture; that the foregoing had occurred to him as of January, 1938, but that such a procedure depended upon the development of meth-

ods, and it might be some time before such a procedure could be worked out to be called an effective means (Rec. 225-6).

Plaintiff points to the testimony of various expert witnesses that the disintegration test is severe and satisfactory (Rec. 2502, 1265-6, 1292); that physical and chemical tests on paper containers at the dairy are adequate to indicate their sanitary condition. With reference to the evidence of Drs. Sanborn and Prucha concerning the advisability of inspection at mills and converting plants, plaintiff argues that they were investigators who were seeking detailed information on the subject; that one becoming an outstanding expert in this field would naturally start at the beginning, but that health officers in various municipalities which are using the single service containers have not felt it necessary to go to the mills or converting plants because they have adequate control after the containers arrive in the municipality, the same as they have over glass bottles, milk, or food products and food containers generally which are brought into their jurisdictions. (This latter point may be disposed of by the suggestion—also made in another connection in this report—that a legislative body may hit at one abuse which it has found, even though it has failed to strike at another (*United States* v. *Carolene Products Co.*, 304 U. S. 144, 151)).

Plaintiff further argues that the recent amendment to the model code of the United States Public Health Service (Sec. 10, Ptfs. Ex. 92; Defts. Ex. 29) does not require inspection and control at the mill, and that the resolution of the Board of Health of the City of Chicago of October 16, 1939, recommending an amendment to the Chicago ordinance, did not insert a condition requiring inspection at the mill. Plaintiff argues that the disintegration test furnishes and has been found to furnish adequate control without necessitating inspection at the mills, and that the sanitary qualities of its containers are as good as, if not better than, the washed glass bottle containers.

The City takes issue with the plaintiff as to what the United States Public Health Service now requires by quoting the following from the amendment to the model ordinance, Item 10p thereof:

"Single-service containers, etc., which have not been manufactured and handled in a sanitary manner may contaminate the milk.

"Satisfactory Compliance.—This Item shall be deemed to have been satisfied if—

• • • • •

2468 "(5) The manufacture, packing, transportation, and handling of single-service containers and container caps and covers are conducted in accordance with the following requirements. Inspections required herein may be made by the health officer or by any agency authorized by him."

The City also argues that it is possible effectively to sterilize a glass milk bottle at the dairy (Rec. 75, Dr. Sanborn), while a paper container requires constant inspection of manufacture and processing at remote places.

This discussion brings us back to the holdings that a legislative body in exercising the police power may decide to prohibit entirely or to regulate, and that the power is not to be denied simply because some innocent articles or transactions may be found within the proscribed class. It also emphasizes the evidence of plaintiff's own experts that conditions at the mill are important and significant, and that therefore adequate control requires not only inspection of the finished product, but also inspection and control of the preceding steps in the manufacture and converting, as a preventive. If this evidence conceivably furnishes a rational basis for legislative judgment that paper containers do possess hazards and deficiencies, it is immaterial that the court on all of the evidence may entertain a different judgment.

The record shows some paper containers, not plaintiff's, with high bacterial counts. In tests on 23 samples, 3 had less than 1000 colonies per container, 5 had 1000 per container, and 13 had above 1000 and up to 26,000, with very objectionable odors from the bacterial colonies (Rec. 527-32). There are a number of companies which manufacture paper containers, under varying conditions. Some of them, possibly many of them, may not observe the ideal precautions. Even plaintiff's container may not always be manufactured with the maximum of safeguards!

It is not a question whether a particular manufacturer or group of manufacturers may observe safeguards. Here we have a case where the legislative body may perhaps out of caution, but upon evidence in the record, have decided that the choice should be against the use of paper containers. And it may have decided that even if paper con-

tainers may serve the purpose of health regulations well, glass bottles serve it better, thus giving us the situation presented by the case of *Pacific States Box & Basket Co.* v. *White,* 296 U. S. 176, hereinafter mentioned; or it may have decided that the cost of inspection and control of paper containers was prohibitive (cf. *Block* v. *City of Chicago,* 239 Ill. 251, 261).

Non-transparency of paper containers:
Non-rising of cream to top:

As further reasons for the prohibition against paper containers, the City cites the fact that paper containers are not transparent and that the cream does not rise to the top in them. It argues that there is a sanitary advantage in a transparent milk container, and that in the glass milk bottle the cream line is visible and the consumer has an opportunity to judge as to the quality of the milk, and, it might be added, as to whether dirt or any other visible foreign body is in the milk; while in the paper container the butter fat content can be determined only by spe-
2469 cial tests (Rec. 688-9) and the milk is for some reason so affected that the cream does not rise to the top as in glass bottles.

The City cites the case of *Pacific States Box & Basket Co.* v. *White,* 296 U. S. 176, in which the Supreme Court upheld an Oregon regulation prescribing hallocks as standard containers for fruits and vegetables. The regulation prescribed not only the capacity, but also the dimensions and form of the containers. Plaintiff had for years sold its containers in Oregon, and because of the expense involved could not change to the new form. The opinion of the Supreme Court says that to fix both the dimension and form "may be" deemed necessary in order to assure observance of the prescribed capacity and to effect other purposes of the regulation; that it "may be" that in Oregon buyers at retail are "less likely" to be deceived as to the "condition and quality" of the berries if sold in the prescribed containers; that the character of the container "may be" an important factor in prescribing the condition of the berries; that a shallow container like the hallock "may conceivably" better preserve the fruits; that a container with perpendicular side "may conceivably" preserve them better than a metal-rim cup with outward sloping sides. The opinion mentions other possible advan-

tages, and says that there may be a reasonable difference of opinion as to the type best adapted to the "protection" of the public.

Plaintiff contends that Section 3094 of the Chicago ordinance here involved is not designed in any respect to prevent fraud in selling milk with too little butter fat, and is not an ordinance on weights and measures; that it is purely a health regulation; that if the consumer does not desire to buy milk because he cannot see the cream line, that is his privilege; that if the cream does not localize at the top and the consumer wants to pour off the cream, he may buy his milk in a glass container; that granting that privilege does not require or authorize depriving plaintiff of the right to sell milk in paper, or depriving other customers of the right to buy their milk in paper; that where the cream concentrates is meaningless from a public health standpoint, as long as it is present in the required amount; that there is nothing in the ordinance regarding transparency of milk containers or directions as to where the cream must localize.

The case of *Koy* v. *City of Chicago*, 263 Ill. 122, 130-1, holds that the "imperative duty" of the municipality includes not only regulation of the sale of milk but also the manner in which purity, wholesomeness and freedom from disease shall be secured "and made to appear"; that to that end the milk containers may be required to be "of prescribed character and capacity;" and that the object of all such restrictions is the preservation of the public health "and as a means to that end the protection of the general public against dishonest vendors of milk."

It may well be a legislative matter whether milk shall be sold in standard transparent glass milk bottles rather than in paper containers in order to protect the public health and to guarantee that milk sold contains the usual amount of cream. As said by the Supreme Court of the
2470 United States in *Pacific States Box & Basket Co.* v. *White*, 296 U. S. 176, *supra:* "Whether it was necessary in Oregon to provide a standard container for raspberries and strawberries, and, if so, whether that adopted should have been made mandatory, involved questions of fact and of policy, the determination of which rests in the legislative branch of the State government. * * * We may inquire only whether it is arbitrary or capricious."

Discriminatory enforcement:

Plaintiff on the basis of *Yick Wo* v. *Hopkins,* 118 U. S. 356, argues that the ordinance is invalid because of alleged discriminatory enforcement. The point is that despite the resolution of the Board of Health passed November 12, 1935, providing that milk shall be dispensed in hotel and restaurants only in original containers, no steps have been taken to enforce the resolution, and that therefore the Board has, at least by acquiescence, approved paper containers as sanitary dispensers within the proviso. Plaintiff relies upon evidence of several such purchases from drug stores in Chicago, and also upon an agreement (Stipulation, see Ptfs. brief p. 15) that ice cream, butter, lard, cheese, oysters, pickles, soft drinks, and liquid coffee are sold at retail daily in Chicago in paraffined cartons made of virgin spruce pulp.

I find that the evidence in this record does not furnish a basis for application of the *Yick Wo* case. There the evidence indicated that the ordinance concerning laundries was in fact directed against Chinese; that while the ordinance in terms applied to all laundries in wooden buildings, it was being given widespread enforcement only against Chinese. There is no such evidence here. The most that can be said is that the City has either not been able to watch every drug store and restaurant, or has not been as vigilant as possible in enforcing the Board's resolution concerning sales of milk in such places. That, however, does not in my opinion affect the validity of the ordinance.

The fact that foods other than milk are sold in containers to which objection may possibly be made does not invalidate the ordinance regarding milk. Aside from the answer that such other foods may be sufficiently different as to fall within a different class from milk, a still further answer is that a legislative body "may hit at an abuse which it has found, even though it has failed to strike at another" (*United States* v. *Carolene Products Co.,* 304 U. S. 150, 151; see also *Block* v. *City of Chicago,* 239 Ill. 251, 259-60).

Certain Contentions of Plaintiff Which Have Not Been Herein Specifically Mentioned:

Even if it may be considered that a number of other municipalities permit paper containers, it may also be considered that there are a much larger number of mu-

nicipalities throughout the country which have not permitted paper containers. The fact that police regulations of a certain kind are in effect in one part of the country does not prove that contrary police regulations in effect in other parts of the country are unreasonable.

The fact that disease or death has not been traced to paper containers presents merely a matter of emi-
2471 phasis and degree, proper for consideration in the formation of legislative judgment. The power to regulate the sale of milk includes the power not only to protect it against disease, but also against impurity. It also includes the power to provide that milk shall meet certain standards of quality. It includes power over the milk receptacles as a means of protecting not only against disease but also against impurity and lack of required quality. Courts in reviewing legislative judgment are concerned only with the question whether there exists evidence furnishing a rational basis for a conclusion that there is possibility or potentiality of a result against which the enactment is directed (*Standard Oil Co.* v. *City of Marysville*, 279 U. S. 582, 586).

Plaintiff refers to Section 15 of the 1939 Illinois Act concerning pasteurized milk and milk products (Ill. Rev. Stats. 1939, Ch. 56½, par. 129), and to the regulation of the State Department of Public Health thereunder, which recognize single service containers. However, Section 19 of that Act preserves the pre-existing home rule of municipalities on that subject. The existence of this statute may be very persuasive to the legislative bodies of municipalities, but where they may be reasonable ground for a conclusion either way, courts cannot substitute their judgment for that of the legislative body.

The same may be said of the action of the United States Public Health Service in the fall of 1939 in amending its model ordinance by adding single service containers (Ptfs. Ex. 92; Defts. Ex. 29; Rec. 1567). In this connection it is to be observed that as late as June, 1939, in the report adding paper containers to standard milk bottles in its model ordinance, the United States Public Health Service Sanitation Advisory Board included a criticism of paper containers (Ptfs. Ex. 61, p. 3; and see quotation *ante* p. 3).

The United States Public Health Service is merely advisory to municipalities. After that body in October, 1939, added single service containers, the Board of Health of

the City of Chicago in the same month passed a resolution recommending to the City Council that it amend the ordinance so as to permit the use of single service containers in addition to standard milk bottles. The City Council has not yet acted on that recommendation. The resolution of the Board will no doubt be given due weight by the City Council. The validity of the action of the City Council, wise or unwise, will depend only upon whether its decision has a reasonable basis. At the present time the ordinance of the City prohibits the use of single service containers. The resolution of the Board of Health does not establish that there is no basis for the prohibition; it merely is evidence that possibly a contrary policy should be adopted.

Plaintiff relies on *People* v. *Carolene Products Co.*, 345 Ill. 166, 168, to the effect that the legislature may not arbitrarily interfere with private business, and holding invalid a prohibition of carolene. In that case, however, the wholesomeness of carolene was admitted. In *United States* v. *Carolene Products Co.*, 304 U. S. 145, involving a federal prohibition of the same product, where wholesomeness was not admitted and the court considered the evidence (pp. 148-9), the prohibition was sustained. In the case at bar, not only does the city contend that
2472 paper containers are not sanitary, but evidence is relied upon to sustain the contention. The only question here is whether that evidence affords the necessary basis.

Pendency Before City Council, Summary and Recommendations:

The application is for an injunction and for a declaratory judgment. The issuance of an injunction is not a matter of absolute right but rests in the sound discretion of the court (*Petroleum Exploration, Inc.* v. *Public Service Commission*, 304 U. S. 209, 218). The issuance of a declaratory judgment also rests in the sound discretion of the court (*American Automobile Ins. Co.* v. *Freundt*, 103 F. (2d) 613, 619 (CCA 7). Since one of the objects necessarily implied in this proceeding is an amendment to the milk ordinance, it is noted that the issuance of a mandatory injunction or mandamus also rests in the sound discretion of the court (*Morrison, et al.* v. *Work, et al.*, 266 U. S. 481, 490).

Both parties agree that, if the phrase "standard milk

bottles'' does not include paper containers, the ordinance prohibits their use. However, in view of the fact that paper containers are of comparatively recent development, it would be more accurate to say that the ordinance does not yet permit them. Innovations, whether in health or other matters, have to stand the test of time and experience before they are adopted. We have a situation where the matter is actually before the City Council and the court is called upon to decide with reference to the same thing. According to the record, health measures first pass through the United States Public Health Service. If that body recommends their adoption, municipalities may or may not follow the lead. Here the United States Public Health Service has only recently taken its action and the Board of Health of the City of Chicago has promptly recommended to the City Council that it amend the ordinance. This matter, therefore, seems to be taking the regular course.

There is, in my opinion, strong basis for a finding that plaintiff has proved by a preponderance of the evidence that its containers are meritorious and should be permitted to be used. However, as already pointed out, in order that plaintiff may prevail, it must prove its case beyond a reasonable doubt; in other words, the question is whether there is enough evidence, even less than a preponderance, to establish a rational basis for the legislative decision. If there is such basis, it is immaterial that the court may have a different opinion as to the wisdom of such decision. And if there is such basis, the constitutional objections must be overruled.

The presumption is that the legislative judgment is valid. I find that there is evidence in the record, from plaintiff's own witnesses, independent of the corroborative testimony of Dr. Arnold, the City's witness, from which the City Council could reasonably have concluded that prohibition of paper containers was necessary and appropriate to protect the purity and wholesomeness of milk, or, to state the proposition another way, it is at least doubtful whether plaintiff has proved that there is not sufficient evidence tending to establish a reasonable basis for such conclusion.

2473 I find that the legislative body may reasonably have based its decision on evidence tending to prove the following:

There are steps in the manufacture, conversion and fil-

ling of paper containers in which bacteria may get into the walls of the containers.

Paper containers, even when paraffined, are to some extent absorbent and the milk may absorb such bacteria.

Sanitary conditions differ from one paper mill to another and even in the same mill from time to time.

The sanitary condition of the mill is a significant factor as to the condition of the finished container.

The sanitary condition of the paper board blank determines the sanitary condition of the finished container.

Particles of paraffin get into the milk and constitute a foreign substance which preferably should not be in milk, especially for babies.

Odors from paraffin, whether the paraffin is fresh or not, may get into the milk.

If the paper board contains a high amount of bacteria, they may exude objectionable odors which may get into the milk.

The control and precautions by paper manufacturers themselves may not be adequate.

In the case of glass bottles, the City has the cleaning process at hand locally and can exercise complete control; in the case of paper containers, inspection at remote places may be necessary, but impractical or too expensive.

Some paper containers have been shown to contain high bacterial counts.

Paper containers are not transparent as glass bottles, so that it is difficult to observe the quality of the milk or whether the milk contains dirt or other foreign body.

Cream does not rise to the top in paper containers, so that purchasers may not readily know whether they are getting milk of the required fat content.

The United States Public Health Service Sanitation Board in June 1939 criticized paper containers on account of their absorbency and the sloughing off of paraffin.

A reasonable basis for the legislative judgment being present, I conclude that the court must hold the ordinance valid and the prohibition of paper containers reasonable.

The findings and conclusions hereinbefore set forth may be considered as the declarations recommended in answer to the request for a declaratory judgment in this case. I shall not repeat every finding, but among them are included the following:

A paper container is not a standard milk bottle within the meaning of Section 3094 of the Revised Chicago Code.

The ordinance is not invalid as indefinite, as a delegation of legislative power, as unreasonable, as a deprivation of property without due process, or on account of discriminatory enforcement.

The acts of the defendants in denying plaintiff the use of its paper containers in the City of Chicago are in
2474 pursuance of the ordinance, and the ordinance, in view of the facts and the applicable rules of law, must be held a valid and reasonable exercise of the police power.

* * * * *

Upon the facts in this record, including the actual pendency of the whole matter before the City Council, I conclude and recommend that the court in the exercise of its sound judicial discretion, and with due regard for comity, public convenience, and the decisions regarding encroachment by the judicial department upon the domain of the legislative department, should not issue the injunction or render the declaratory judgment requested.

Dated at Chicago, Illinois, this 27th day of April, 1940.

Respectfully submitted,

Jacob I. Grossman,

Master in Chancery.

2814 And on, to-wit, the 7th day of May, A. D. 1940, came the Plaintiff by its attorneys and filed in the Clerk's office of said Court its certain Notice and Objections to Final and Modified Report of Master in Chancery Jacob I. Grossman, in words and figures following, to-wit: Filed May 7, 1940.

2815 IN THE DISTRICT COURT OF THE UNITED STATES.

NOTICE.

To:

Barnet Hodes,
Corporation Counsel,
#1300—139 N. Clark Street.
Walter V. Schaefer,
First Assistant Corporation Counsel,
#1300—139 N. Clark Street.
Charles P. Horan,
Assistant Corporation Counsel,
#1300—139 N. Clark Street.
Chicago, Illinois.

You are herewith served with a true copy of plaintiff's Objections to the Final and Modified Report of Master in Chancery Jacob I. Grossman; and said Objections attached are being filed by plaintiff pursuant to the Rules of Court for hearing and disposition by the trial court, before whom said cause is now pending.

Gariepy & Gariepy,
V. P. Frank & F. A. Gariepy,
Attorneys for Plaintiff.

Received a copy of this notice and the above described objections this 7th day of May, 1940.

Barnet Hodes,
Walter V. Schaefer,
Charles P. Horan.

Filed May 7, 1940. 2816

In the

DISTRICT COURT OF THE UNITED STATES.

OBJECTIONS TO MASTER'S REPORT.

Now comes the plaintiff, Fieldcrest Dairies (Inc.), and files and states its objections to the Amended and Modified Report of Jacob I. Grossman, Master in Chancery, dated April 15th, 1940, and filed April 27th, 1940, as follows:

(1) The Master erroneously stated (Page 5 of the Master's Report) that "the issues are whether plaintiff's paper container is a 'standard milk bottle' within the meaning of the Chicago Milk Ordinance, and, if not, whether the ordinance is invalid. Both parties take the position that if the paper container is not a standard milk bottle, the ordinance prohibits the use of paper containers."

Whereas, the Master should have stated the issues as follows: "Does the clause 'standard milk bottle' exclude the use of plaintiff's container? Does the failure of the ordinance to define 'standard milk bottle' render the ordinance invalid? Is the ordinance unreasonable? Has the ordinance been unreasonably administered by the Board of Health?

(2) The Master erroneously found (Page 6 of the Master's Report) that "glass milk bottles have constituted a distinct and definite class of bottles;" whereas
2817 the Master should have found and fails to find as established by the evidence that "glass milk bottles have constituted a distinct and definite class of glass bottles."

(3) The Master erroneously found (Page 6 of the Master's Report) that Dr. Tracy, plaintiff's witness, testified that if he were selling milk at retail in Chicago, the term "standard milk bottle" would mean to him a glass milk bottle of a certain size and shape (Record Pages 481-4. Whereas, the Master should have found and fails to find as established by the evidence (Record Page 681) that Dr. Tracy testified as follows: "There is a standard glass milk bottle but there is no standard milk bottle that I know of."

(4) The Master erroneously found (Page 6 of the Master's Report) that "a person of average intelligence would experience no difficulty in selecting a milk bottle from an array of other bottles." Whereas, the Master should have found and fails to find as established by the evidence, that milk bottles in use in the United States differ as to materials, shape, size and weight, and that, therefore, there is no such thing as a "standard milk bottle."

(5) The Master erroneously found (Page 6 of the Master's Report) that "to classify plaintiff's paper container as a 'bottle' would require considerable straining of the definitions of a bottle." Whereas, the Master should have found and fails to find as established by the evidence that a bottle is defined as a 'vessel designed to hold liquids constructed of various materials and in various forms' or 'a hollow mouthed vessel of glass, wood, 2818 leather or other material for holding and carrying liquid, and that plaintiff's paper container clearly comes within the definition of a bottle."

(6) The Master erroneously found (Page 7 of the Master's Report) that "the general understanding of standard milk bottle has always been that they are of the familiar shape and are made of glass." Whereas, the Master should have found and fails to find as established by the evidence "that there is no such bottle as a 'standard milk bottle,' and that milk bottles of various shapes, sizes and materials are used throughout the United States."

(7) The Master erroneously found (Page 8 of the Master's Report) that "the standard milk bottle specified in the ordinance is a glass bottle of the type, shape and proportion well known to the trade and community in Chicago as having been used for many years for the delivery of milk at retail and that plaintiff's container is not a standard milk bottle within the meaning of the ordinance." Whereas, the Master should have found and fails to find as established by the evidence that the ordinance does not define a 'standard milk bottle,' that the term 'standard milk bottle' is not self-definitive; that the term 'bottle' is now so loosely used that its limit of application is not well defined; and that plaintiff's paper container is a standard milk bottle within the meaning of the ordinance.

(8) The Master erroneously found (Page 9 of the Master's Report) that "the phrase 'standard milk bottle'

is self-definitive." Whereas, the Master should have found and fails to find that the term 'standard milk bottle' is not
defined by the ordinance, and the definition thereof
2819 must be supplied by the officer who executes the ordi-
nance, which is an unwarranted delegation of legislative authority to an executive officer, which renders this provision of the ordinance invalid."

(9) The Master erroneously found that (Page 12 of the Master's Report) "the proviso permitting hotels, soda fountains, restaurants and similar establishments to dispense milk from sanitary dispensers approved by the Board of Health does not give the Board of Health legislative power and is therefore valid." Whereas, the Master should have found and fails to find "that the proviso creates an unreasonable basis for classification, is a delegation of legislative authority without rules to guide the action of the Board of Health; and that inasmuch as the Court cannot say that the City Council would have passed the ordinance unaccompanied by this invalid proviso, the entire act is invalid."

(10) The Master erroneously found that (Page 15 of the Master's Report) "legislation must be sustained, even if the rational ground therefor is established by less than a preponderance of the evidence, and even if the Court from a preponderance of the evidence may reach an opposite judgment." Whereas, the Master should have found and fails to find that "some rational ground for the enactment of legislation should be established at least by a preponderance of the evidence, and that the Court cannot find that some rational ground exists for the passage of the ordinance unless such ground is proven by such a preponderance."

(11) The Master erroneously found that (Page 25 of the Master's Report) "the evidence is such that a legislative
body might reasonably conclude that at one or
2820 more of the many steps and stages from the pulp to the
sealed container, contamination might occur through carelessness, desire to save expense, inadequate facilities, or other reason." Whereas, the Master should have found and fails to find as established by the evidence that "the evidence is such that a legislative body could not reasonably conclude that at any of the steps and stages from the pulp to the sealed container, contamination might occur in any manner whatsoever, that the plaintiff has proved by a clear

preponderance of the evidence that no contamination can occur in the plaintiff's container from the many steps and stages in its manufacture from the pulp to the finished, filled and sealed container, and that plaintiff's container is sanitary, sterilized and not in violation of the provisions of the Ordinance or the rules and regulations of the Board of Health."

(12) The Master erroneously found (Page 26 of the Master's Report) that "the finished paper containers are absorbent; and that the walls of the finished container may contain bacteria; that paraffining is not an effective sterilizing agent." Whereas, the Master should have found and fails to find as established by the evidence that "the slight amount of absorption present in the paper container presents no health hazard."

(13) The Master erroneously found (Page 27 of the Master's Report) that "a legislative body might reasonably be of the opinion that there is some danger that the walls of the finished paper container may contain bacteria, and that, by reason of the absorbency of the container walls, even when paraffined, the bacteria may get into the milk."

Whereas, the Master should have found and fails to
2821 find as established by the uncontradicted evidence in the record that there are no injurious bacteria in the paper board and that the slight absorption existing in the paper container creates no health hazard. That no legislative body could reasonably be of the opinion that any health hazard exists by reason of absorption of milk by plaintiff's container.

(14) The Master erroneously found (Page 28 of the Master's Report) that "the Legislature might not unreasonably refuse to permit the use of paper containers because there is a sloughing off of particles of paraffin into the milk." Whereas, the Master should have found and fails to find as established by the uncontradicted evidence in the record that paraffin particles so sloughed off are so small as to be unimportant, that paraffin is not harmful and that any action of a legislative body in refusing to permit the use of a paper carton because of the possibility of the sloughing off of minute particles of paraffin is unreasonable.

(15) The Master erroneously found (Pages 30 and 31 of the Master's Report) that "the City Council in prohibiting paper containers might conceivably have taken into

consideration possible staleness of the paraffin, oxidation of the paraffin, the possibility of rancid odors from oxidized paraffin being imparted to the milk, and the possibility of objectionable odors in large counts of bacteria in the paper getting into the milk." Whereas, the Master should have but failed to find as established by the uncontradicted evidence in the record, that the paraffin used in plaintiff's cartons is clean, pure, harmless, contains no odors, is
2822 not heated to such a degree as to oxidize, is changed daily at plaintiff's plant and there is no health hazard in the use of paraffin in plaintiff's containers. That there is no evidence in the record of large counts of bacteria in plaintiff's container and that therefore no objectionable odors could get into the milk from bacteria. That the City Council would have been unreasonable in excluding plaintiff's container because of the possibility of staleness of paraffin, oxidation and rancid odors where no such possibility exists as to plaintiff's container.

(16) The Master erroneously found (Pages 35 and 36 of the Master's Report) that "the City Council may have reasonably determined that even if paper containers may serve the purpose of health regulations well, glass bottles serve it better, and that the cost of inspection and control of paper containers was prohibitive." Whereas, the Master should have found but failed to find as established by the evidence that the paper carton serves the purpose of health regulations better than the glass container, and that it is unnecessary to inspect and control at the mill, inasmuch as the tests on paper containers at the dairy are severe, satisfactory and adequate to determine their sanitary condition. That to exclude paper containers because of the unwarranted suggestion that control should be had at the mill would constitute an unreasonable assumption by the City Council.

(17) The Master erroneously finds (Page 36 of the Master's Report) that "inasmuch as the record indicates that some paper containers (not plaintiff's) have high bacterial counts, some companies might not observe the ideal precautions (taken by the manufacturers of plain-
2823 tiff's container) and that plaintiff's container might not always be manufactured with the maximum of safeguards." Whereas, the Master should have found but fails to find that conditions as to other containers should have no bearing on a finding that plaintiff's carton is sterile,

sanitary and presents no health hazards; and that it should be presumed that the condition of sanitation and sterility of plaintiff's container will continue to exist.

(18) The Master erroneously finds (Pages 37 to 40 of the Master's Report) that "it may well be a legislative matter whether milk shall be sold in transparent containers so that the public might be able to determine the quality of the milk sold, and whether any visible foreign body is in the milk; also that cream does not rise to the top in single service containers." Whereas, the Master fails to find and should have found that the ordinance does not specifically provide that milk shall be sold only in transparent containers nor does it provide that there should be a "cream line." That the ordinance by its other provisions adequately protects the public against fraud by adulteration and low butter-fat content.

(19) The Master erroneously found (Pages 41 and 42 of the Master's Report) that "the sale by drugstores of milk in paper containers, and also the sale of ice cream, butter, lard, cheese, oysters, pickles, soft drinks and liquid coffee at retail in paper containers in the City of Chicago is not discriminatory." Whereas, the Master should have found but fails to find that the ordinance has been discriminately enforced against paper cartons for the delivery of milk.

2824 (20) The Master erroneously found (Page 43 of the Master's Report) that "evidence of the permitted use of single service containers in a large number of communities without a single health hazard is immaterial and unworthy of consideration."

(21) The Master erroneously found (Page 44 of the Master's Report) that "the action of the State Legislature in permitting the use of single service containers is merely persuasive to the City Council." Whereas, the Master should have found but fails to find that the provision of the State Statute determines the public policy of the State and all its subordinate bodies, and that although the City under the "home rule provision" of the Statute can regulate the use of paper containers it cannot prohibit their use.

(22) The Master erroneously found (Page 45 of the Master's Report) that "at the present time the ordinance of the City prohibtis the use of single service containers." Whereas, the Master should have found but fails to find that there is no prohibition in the ordinance against the use of single service containers.

(23) The Master erroneously found (Page 46 of the Master's Report) that "not only does the City contend that paper containers are not sanitary, but evidence is relied upon to sustain the contention." Whereas, the Master should have found but fails to find that "the Board of Health, by recommending to the City Council the passage of an ordinance permitting the use of single service containers, has admitted that the paper containers are sanitary."

(24) The Master erroneously found (Page 48 of the Master's Report) that "the plaintiff must prove its
2825 case beyond a reasonable doubt.

(25) The Master erroneously found (Page 49 of the Master's Report) that "It is at least doubtful whether plaintiff has proved that there is not sufficient evidence tending to establish a reasonable basis for the conclusion of the City Council to prohibit the paper container." Whereas, the Master should have found but fails to find that the defendant should have proved but has failed to prove that there is sufficient evidence tending to establish a reasonable basis for the conclusion of the City Council to prohibit the paper container.

(26) The Master erroneously found (Pages 49 and 50 of the Master's Report) that "the legislative body might reasonably have based its decision to exclude single service containers on evidence tending to prove certain alleged facts (therein set forth)." Whereas, the Master should have found but fails to find that the reasons set forth are not existent in the case of plaintiff's containers, are mere guesses not based on any proof, are possibilities and not probabilities, and do not form any reasonable basis for the exclusion by the City Council of plaintiff's containers.

(27) The Master erroneously found that there is reasonable basis for the legislative judgment. Whereas, the Master should have found but fails to find that the City Council has failed to exercise its legislative judgment.

(28) Plaintiff objects to the following conclusions of the Master:

(a) That the ordinance is valid.

(b) That the prohibition of paper containers is reasonable.

2826 (c) That a paper container is not a standard milk bottle within the meaning of the ordinance.

(d) That the ordinance is not invalid, as indefinite, as

a delegation of legislative power, as unreasonable, as a deprivation of property without due process, and on account of discriminating enforcement.

(e) That the acts of the defendants in denying plaintiff the use of its paper containers in the City of Chicago are in pursuance of the ordinance, and the ordinance is a valid and reasonable exercise of the police power.

(f) That the Court should not issue the injunction or render the declaratory judgment requested.

(29) That the Master should have found but has failed to find as established by evidence, the following:

(a) That plaintiff's plant and pasteurization equipment, methods and conditions have been approved by the State Board of Health for sale of milk in its single service containers.

(b) That plaintiff has a permit from the Board of Health to sell its unpasteurized milk in the City of Chicago at wholesale.

(c) That plaintiff's plant has been inspected and approved by the Board of Health for sale of milk at wholesale.

(d) That the plaintiff (by and through the Dean
2827 Milk Company or J. C. Wieland-Dean Company or by itself) applied for a permit to use single service containers in the City of Chicago on January 13, 1936; November 5, 1936; December 4, 1937; January 23, 1939 and January 31, 1939; that the necessary sums were paid to the City of Chicago on January 23, 1939 for said permit; and that no action has been taken upon said application.

(e) That ice cream, butter, lard, cottage cheese, other cheese, pickles, soft drinks and liquid coffee are sold daily in the City of Chicago, at retail, in paraffined paper cartons made of virgin spruce pulp.

(f) That ice cream is sold daily in the City of Chicago in metal cans with a thin paraffined paper liner between the ice cream and the metal container; thin paraffined paper is permitted by the Board of Health of the City of Chicago to be placed across the top of metal milk cans underneath the metal cover of such cans; and paraffined drinking cups and paper straws are used daily in the City of Chicago, as well as paraffined paper liners for dishes in which ice cream is served.

(g) That prior to the commencement of this suit and ever since the plaintiff has sold liquid milk and milk prod-

ucts in its single service containers in sixty-eight (68) municipalities in the Counties of Cook, Lake and DuPage, Illinois.

2828 (h) That no new or unusual health hazard exists in the use of paper milk bottles.

(i) That there is no evidence in the record that any public health hazard has been or will be created by the use of paper milk bottles in 485 cities and villages in the United States where it is used daily.

(j) That bacteriological control over the single service container is adequate and sufficient and is at least equal to the control over the glass milk bottle.

(k) That the possibility of contamination from a diseased employee is greater in the case of a glass milk bottle than in paper bottles.

(l) That health hazards in a paper bottle dairy are far less than in a glass bottle dairy.

(m) That no health problem exists in the use of paper bottles which does not exist with glass bottles.

(n) That the bacteria count on glass bottles ready to be filled with milk has been generally found to be higher than on paper bottles.

(o) That paper milk bottles are superior to the glass milk bottle, since there is no chance to spread infectious disease organisms from household to household by a single service container.

(p) That the paper board in the single service container is so free from bacteria that the absorption of milk in the board presents no health problem.

(q) The rinse and disintegration test gives as
2829 adequate control over paper containers as over glass containers, to the end that the public health authorities can determine whether or not the cartons are sterile or contaminated without visiting the mills to examine the paper-making and converting process.

(r) That no strange or offensive odors exist as the result of the use of paper bottles, nor is there any strange taste in the milk distributed in paper bottles.

(s) That since there are no dangerous bacteria in the board to mix with bacteria commonly found in milk, there is no health hazard by reason of absorption of milk into the walls of the paper container.

(t) That paper containers are superior to glass bottles from a public health angle for the distribution of milk be-

cause all chance of spreading disease by re-use of the container is avoided in the use of the single service container.

(u) That the adhesive used in the container is sterile and without bacteria growth; and the taste, color, odor and health giving properties of milk is not harmed by contact with this adhesive.

(v) The paraffin bath used in single service containers is sterile and without bacteria, serves to seal in and destroy any bacteria present, and the chipping off of slivers of paraffin in milk presents no health problem.

(w) The possibility of oxidation of paraffin presents no health hazards.

(x) The paraffin used in plaintiff's container is free from all traces of rancidity or odors.

2830 (y) That sunlight, heat and cold have a more injurious effect upon glass bottles than on paper.

(z) That plaintiff's container is being used successfully in practical operation in 481 municipalities, including New York City, Philadelphia, Baltimore, Washington, D. C., Dayton, Ohio; Indianapolis, Detroit, Seattle, Los Angeles, San Francisco, Oakland, Phoenix; Flint, Michigan and Louisville, Kentucky, and that three to four hundred thousand of said containers are being sold daily.

(aa) That the United States Public Health Service has approved the use of single service containers and has recommended regulations for their control, and the Board of Health of the City of Chicago has recommended an amendment to the ordinance to include single service containers.

(bb) The ordinance does not expressly exclude the use of the single service container for the delivery of milk in quantities of less than one gallon.

(cc) The term "bottle" is loosely used and includes receptacles made of materials other than glass.

(dd) Milk bottles are of various sizes, shapes and colors and there is no such receptacle as a "standard milk bottle."

(ee) The ordinance does not define a "standard milk bottle."

(ff) The ordinance gives the Board of Health un-
2831 limited power to determine what is a "standard milk bottle", which is an unwarranted delegation of legislative power to an executive officer.

(gg) The proviso in the ordinance giving the Board of Health power to approve sanitary dispensers for milk in

hotels, soda fountains and restaurants is an unlawful delegation of legislative powers to an administrative body and invalidates the requirement of "standard milk bottles."

(hh) If the ordinance can be construed as prohibiting the use of plaintiff's single service container, it is unreasonable, unjust and oppressive and is therefore void.

(ii) The city ordinance is invalid because repugnant to the policy of the State as declared by the State Legislature which permits the use of paper containers and provides regulations for their use.

(jj) The exclusion of single service containers is unreasonable inasmuch as the Board of Health has recommended an amendment to the ordinance permitting their use.

(kk) The public health safety, comfort or welfare is not interfered with by the use of paper containers and the action of the City of Chicago in excluding its use deprives the plaintiff of property without due process of law in violation of the State and Federal Constitutions.

(ll) The "Public Health Reasons" in the regulations of the Board of Health of the City of Chicago explaining the purposes of Section 3094 of the Ordinance clearly indicate that the use of the single service container would eliminate all of the evils which this section seeks to prevent, and far better than by the use of glass containers.

2832 (mm) If the ordinance excludes the use of plaintiff's container it arbitrarily interferes with private business and prohibits a lawful occupation or imposes unreasonable and unnecessary restrictions upon them, and thus deprives plaintiff of property without due process of law in violation of the State and Federal Constitutions.

(nn) The ordinance denies to plaintiff the Equal Protection of the law in violation of the State and Federal Constitutions because the discrimination against paper bottles is unreasonable and has no substantial relation to the object of the ordinance.

(oo) The ordinance is contrary to the Federal and State Constitutions in that it has been discriminately enforced by the Board of Health in permitting the use of paper containers for the sale of milk in drug stores and restaurants while at the same time denying the right of the plaintiff to sell milk in its paper containers.

(30) The Master should have but fails to recommend a declaratory judgment in this cause to the effect that:

(a) Plaintiff's single service container is a standard milk bottle within the meaning of Section 3094 of the Revised Chicago Code.

(b) The ordinance is invalid as indefinite, as a delegation of legislative power, as unreasonable, as a deprivation of property without due process of law and on account of discriminatory enforcement.

(c) The ordinance is not a valid and reasonable exercise of the police power.

(31) The Master should have found but failed to
2833 find that the only reason given by the Board of Health for its failure to issue a permit to plaintiff for the use of its container in the delivery of milk was that it was awaiting the recommendation of the United States Public Health Service, whose model ordinance and advice furnish the lead for municipalities through the country; that the United States Public Health Service subsequently recommended the use of single service containers; that the Board of Health has recommended to the City Council an amendment to the ordinance so as to expressly provide for the use of such a container; that the failure of the City Council to pass such an amendment or the Board of Health to issue to plaintiff a permit as requested is unreasonable; and the plaintiff is entitled to the protection of the Courts, as against the unreasonable and discriminatory conduct of the defendants.

(32) The Master should have recommended the issuance of an injunction as prayed in the Complaint.

(33) The plaintiff objects to each and all of the recommendations and conclusions of the Master as stated in said Report.

Gariepy & Gariepy and
V. P. Frank,
Attorneys for the Plaintiff.

Filed May 14, 1940.

2834 And on, to wit, the 14th day of May, A. D. 1940 there was filed in the Clerk's office of said Court a certain Notice, in words and figures following, to wit:

2835 IN THE DISTRICT COURT OF THE UNITED STATES.

* * (Caption—316) * *

NOTICE.

To: Messrs. Gariepy and Gariepy,
1 N. La Salle Street, Chicago, Illinois.
Mr. Victor P. Frank,
33 N. La Salle Street, Chicago, Illinois.

You are hereby notified that on Tuesday, May 14, 1940, at the opening of court or as soon thereafter as counsel may be heard, we shall appear before the Honorable Charles E. Woodward, Judge of the United States District Court for the Northern District of Illinois, Eastern Division, and shall present a motion for the entry of a decree in accordance with the report of the Master in Chancery in this case, a copy of which motion is herewith served upon you.

Barnet Hodes,
Corporation Counsel,
Walter V. Schaefer,
Assistant Corporation Counsel,
Charles P. Horan,
Assistant Corporation Counsel,
Attorneys for Defendants.

Received a copy of the foregoing notice and of the motion therein referred to this 13th day of May, 1940.

Gariepy & Gariepy, (NWE)
Victor P. Frank,
Attorneys for Plaintiff.

2836 And on, to wit, the 14th day of May, A. D. 1940 came the Defendants by their attorneys and filed in the Clerk's office of said Court, their certain Motion in words and figures following, to wit:

2837 IN THE DISTRICT COURT OF THE UNITED STATES. Filed May 14, 1940.

* * (Caption—316) * *

MOTION.

The defendants, by their attorneys, respectfully represent to the court that on April 27, 1940 the report of Jacob J. Grossman, Master in Chancery in this case, making findings of fact and recommending that the court should not issue the injunction or render the declaratory judgment requested, was filed with the clerk of this court. Subsequently, on May 7, 1940, objections to the report of the Master in Chancery were filed by the plaintiff.

The defendants respectfully move for the entry of a decree in accordance with the report of the Master in Chancery.

City of Chicago, a municipal corporation,
Board of Health of the City of Chicago,
Dr. Robert A. Black, Health Commissioner and Acting President of the Board of Health of the City of Chicago,
Defendants.

By Barnet Hodes,
Corporation Counsel,
Walter V. Schaefer,
Assistant Corporation Counsel,
Charles P. Horan,
Assistant Corporation Counsel,
Attorneys for Defendants.

2838 And afterwards, to wit, on the 14th day of May, A. D. 1940, being one of the days of the regular May term of said Court, in the record of proceedings thereof, in said entitled cause, before the Honorable Charles E. Woodward, District Judge, appears the following entry, to wit:

Entered May 14, 1940.

2839 IN THE DISTRICT COURT OF THE UNITED STATES.
• • (Caption—316) • •

Tuesday, May 14, A. D. 1940.

Present: Hon. Charles E. Woodward, District Judge.

This day comes the defendant by its attorneys and enters its motion for entry of decree in accordance with the Master's Report which motion is entered and set for hearing October 16, A. D. 1940 at 10 A. M.

Filed Oct. 18, 1940.

2840 And on, to wit, the 18th day of October, A. D. 1940 there was filed in the Clerk's office of said Court a certain Memorandum by Judge Woodward, in words and figures following, to wit:

2841 IN THE DISTRICT COURT OF THE UNITED STATES.
• • (Caption—316) • •

MEMORANDUM.

October 18, 1940.

WOODWARD, *District Judge:*

The argument of the exceptions to the Master's report has taken a wide range. But this lawsuit, like many other lawsuits, resolves itself into very simple elements.

The great preponderance of the evidence is to the effect that the milk containers of the plaintiff—referred to as single service containers—contain no new or unusual health hazard. The evidence shows that they are safe and sanitary containers in which milk may be delivered. The uncontradicted evidence shows also that containers and receptacles less meritorious in structure and design from those of plaintiff's are in daily use in the City of Chicago for the sale of milk, chocolate milk, ice cream, and other liquids by drug stores, hotels, restaurants and soda fountains. Paper containers are also in common use for

2842 cheese, cottage cheese, butter, meat, fruit, foods, drinks and other edibles. The dispensing of such articles—including milk and milk products—in paper

containers is not, as shown by the evidence, deemed to create any hazard to the public health. Moreover, in the cities and villages where similar containers have been used over a substantial period, no epidemic, disease or any public health hazard has been created or suspected as being traced to the use of paper containers. In fact, so far as the evidence shows, no individual instance of serious disease or minor ailment has been traced to the use of paper containers. The results of practical experience are more persuasive than the opposing theories of experts.

The Court finds that the single service containers of the plaintiff, offered and admitted in evidence in this case, conform with the sanitary and health requirements of the city ordinances of the City of Chicago.

The Chicago city ordinance provides that milk and milk products, when sold in quantities of less than one gallon, shall be delivered in "standard milk bottles."

The Court has no difficulty in holding that plaintiff's single service container offered and admitted in evidence in this case is a "milk bottle" within the meaning of the ordinance. The definition of the word "bottle" given by practically all lexicographers, as well as the meaning
2843 of the word as used in common speech, shows that the word has no limited and restricted meaning. It is a word of broad and extensive connotation. Webster's New International Dictionary states, among other things, that the word "bottle is now so loosely used that its limit of application is not well-defined."

There is no requirement either in common speech, or by the dictionary definitions, that a bottle should be made of glass. Historically, in ancient times and in our times in certain parts of Southern Europe, as we are told by the Encyclopedia Brittanica, bottles made of skins were and are now used for containing and transporting liquids. While, in modern times, bottles have usually been made of glass, yet of the material out of which bottles have been made may be mentioned, besides glass and skins, hard stone, wood, ivory, bone, porcelain, glazed pottery and common earthenware. In fact, a bottle is not characterized by the material out of which it is made. Whether made of skins or glass or other hard substance a bottle must have certain characteristics. It must be an open mouthed vessel, it must have a neck with an aperture which may be closed with a plug, string or a stopper; and it must be

capable of containing liquids. The Master has described plaintiff's single service container as follows:

2844 "Plaintiff's container is a prismatic box about 6½ inches high and 4½ inches wide, with a gable top, made of paper and paraffined on the inside and outside. In the middle of one of the slanting surfaces of the gable top is a so-called pouring lip which is about an inch square and which is pulled out like an ear when milk is poured out of the container."

Plaintiff's single service container, as described by the Master, has all the characteristics of a "milk bottle", and, as indicated, the Court holds that it is a "milk bottle" within the meaning of the ordinance.

Having found that plaintiff's single service container is a "milk bottle" within the meaning of the ordinance, the next inquiry is, Is it a "standard milk bottle"?

The ordinance contains no definition of the word "standard." No reference is made in the ordinance to any statute, other ordinance or official regulation by which the meaning of the word may be ascertained.

In the absence of official prescription, resort must first be had to the meaning of the word as given by lexicographers. One meaning given to the word by all lexicographers is that which is

> "set up and established by authority as a rule for the measure of quantity, weight, extent, value or quality." (Webster's New International Dictionary.)

It also has the significance of

> "an accepted or established rule or model." (Webster's New International Dictionary.)

2845 Funk & Wagnall's New Standard Dictionary defines "standard" as

> "having the accuracy or authority of a standard; serving as a gauge, test, guide or model."

A "standard", therefore, may be said to be a type or model accepted as correct.

A standard, if not prescribed by statute or ordinance, would be a type, model or criterion recognized and approved by the class of persons engaged in the particular industry or business under consideration. The industry here under consideration is the milk industry—the delivery of milk for human consumption. If, in any given industry or business, the Court is called upon to declare whether a certain article is a standard article in that industry or

business, resort must be had to what is recognized in such industry or business as a correct and accepted type, model or criterion. The word "standard", as used in the ordinance, must be construed with reference to what articles are accepted in the milk industry as correct and proper containers.

It is perfectly proper, therefore, in construing the word "standard", as used in the ordinance, to consider what is recognized as a "standard milk bottle" in the milk industry, by boards of health, by state statutes and by the United States Public Health Service. In construing the word, the Court is not confined to any local construc-
2846 tion which may be given by the local board of health in construing its own ordinance, but may resort to the custom, type or model which is recognized generally in the industry. In other words, the country-wide standard is the one to be determined and applied. The ordinance is not static. The words are general and continuing in their operation. The ordinance must be construed in the light of new and changing conditions and current thought and practice. If, in the course of time, the advancement of science has produced a container which serves the same purpose as a glass container, and if the product delivered therein conforms to the requirements of sanitation prescribed by the health ordinances, then the ordinance must be given such construction as to permit the use of the later developed scientific container.

The record contains much evidence as to the use of the paper containers in New York City, Philadelphia, Boston, Detroit, Cleveland, San Francisco and 480 other cities and villages, including many cities and villages and municipalities in Cook, Lake and DuPage Counties, Illinois. In these cities and municipalities the use of the paper container for the delivery of milk is recognized by ordinance, custom, usage and common acceptance as being a standard
2847 article in which milk may be delivered. Besides, under the statutes of the State of Illinois (Ill. Rev. Stat.) 1939, Ch. 56½, par. 129) single service paper containers are recognized as proper and safe receptacles for the delivery of milk in the State of Illinois. The United States Public Health Service also has recommended a model ordinance for adoption for the City of Chicago which expressly permits the use of paper containers.

The Court holds that plaintiff's single service paper con-

tainers, as offered and admitted in evidence, are "standard milk bottles" within the meaning of the ordinance.

The ordinance thus construed has no constitutional infirmity.

Any other construction would render the ordinance void. Moreover, the Court is of opinion that under the recent statute of Illinois, heretofore referred to, the city is without power to prohibit the use of single service containers if such containers conform with the provisions of the statute.

2848 The Court will enter a declaratory judgment in accordance with the prayer of the complaint finding that plaintiff's single service containers are in conformity with the ordinance and enjoining the defendant from interfering with plaintiff in the sale and delivery of milk and milk products in single service containers.

A formal order on exceptions to the Master's report, findings of fact and conclusions of law, and a decree in conformity with this recommendation may be tendered after notice.

Filed Oct. 23, 1940.

2852 And afterwards, to wit, on the 23rd day of October, A. D. 1940, being one of the days of the regular October term of said Court, in the record of proceedings thereof, in said entitled cause, before the Honorable Charles E. Woodward, District Judge, appears the following entry, to wit:

2853 IN THE DISTRICT COURT OF THE UNITED STATES.

* * (Caption—316) * *

FINDINGS OF FACT.

The Court finds the facts herein specially as follows:

1. The plaintiff is a resident and citizen of Michigan and the defendants are residents and citizens of the State of Illinois.

2. The amount in controversy exclusive of interest and costs exceeds Three Thousand Dollars ($3,000.00).

3. An actual and bona fide controversy exists between the plaintiff on one hand and the defendants on the other as to the interpretation and validity of Section 3094 of the Revised Chicago Code of 1931, as amended on Janu-

ary 4, 1935 (now re-enacted as section 154-15, Municipal Code of Chicago, 1939, but hereinafter for convenience called "Section 3094".)

4. The defendants prior to the institution of this suit and at all times thereafter have contended that section 3094 prohibits the use of the "Pure-Pak" paper milk bottle referred to in the complaint and evidence herein for delivering milk in the city of Chicago in less than gallon
2854 quantities. They also contended and still contend that as so interpreted, said section 3094 is valid.

5. The plaintiff has contended and still contends that section 3094 does not prohibit said use of the Pure-Pak paper milk bottle and that if the section is construed so as to prohibit such use it is unreasonable, discriminatory, and void and in violation of section 2 of article 2 of the Constitution of the State of Illinois and of section 1 of the 14th Amendment to the Constitution of the United States.

6. The defendants have threatened to and unless enjoined by the Court will arrest and prosecute the plaintiff's officers, agents and employees if they deliver milk in the City of Chicago in less than gallon quantities in said Pure-Pak paper milk bottles. The actions and threats of the defendants irreparably damage the plaintiff. The plaintiff has no adequate remedy at law.

7. Section 3094 provides in part:

"The sale of dipped milk and milk products is hereby expressly prohibited. • • • Any milk or milk products sold in quantities of less than one gallon shall be delivered in standard milk bottles; provided, however, that nothing herein contained shall be construed to prohibit hotels, soda fountains, restaurants and similar establishments from dispensing milk or milk products from sanitary dispensers approved by the Board of Health. • • • "

8. The Pure-Pak paper milk bottle is a standard milk bottle.

9. The Pure-Pak paper milk bottle contains no new or unusual health hazard and they are safe and sanitary containers for the delivery of milk, cream and milk products.

10. The Pure-Pak paper milk bottle conforms with the sanitary and health requirements of the city ordinances of the City of Chicago.

2855 11. The Pure-Pak paper milk bottle conforms with the provisions of the state statute of Illinois (Illinois

Revised Statutes, 1939, chapter 56½, para. 129, item 10,) and the regulations of the Illinois Department of Health.

12. If section 3094 were to be construed to prohibit the use of plaintiff's Pure-Pak paper milk bottle for the delivery of milk in the City of Chicago in less than gallon quantities, said ordinance would be unreasonable and discriminatory and without any reasonable basis.

Enter this 23rd day of October, A. D. 1940.

Charles E. Woodward,
Judge.

Filed Oct. 23, 1940.

2856 And afterwards, to wit, on the 23rd day of October, A. D. 1940, being one of the days of the regular October term of said Court, in the record of proceedings thereof, in said entitled cause, before the Honorable Charles E. Woodward, District Judge, appears the following entry, to wit:

2857 IN THE DISTRICT COURT OF THE UNITED STATES.

* * (Caption—316) * *

CONCLUSIONS OF LAW.

The Court concludes as matters of Law:

1. This Court has jurisdiction of this suit on account of diversity of citizenship and presence of the jurisdictional amount.

2. This suit is properly brought and prosecuted under the Federal Declaratory Judgment statute (48 Stat. L. 955) and the Federal Rules of Civil Procedure relating thereto.

3. The Court has equitable jurisdiction to grant an injunction herein as prayed in the plaintiff's complaint.

4. Section 3094 of the Revised Chicago Code, 1931, as amended (reenacted August 30, 1939 as Section 154-15 of the Municipal Code of Chicago, 1939, but hereinafter for convenience referred to as "Section 3094") properly interpreted does not prohibit the delivery of milk or milk products in the plaintiff's "Pure-Pak" paper milk bottle
2858 in quantities of less than one gallon in the City of Chicago.

5. If Section 3094 were to be construed to prohibit the use of plaintiff's single-service paper containers, said con-

struction would render said provision and requirements of the ordinance void.

6. The plaintiff is entitled to a declaratory judgment that its said single-service container complies with the ordinances of the City of Chicago.

7. The plaintiff is entitled to an injunction restraining the defendants, their officers and agents from interfering with plaintiff in the sale and delivery of milk and milk products in said Pure-Pak paper milk bottles.

8. The plaintiff is equitably entitled to have the costs of this proceeding taxed against and paid by the defendants.

Enter this 23rd day of October, A. D. 1940.

Charles E. Woodward,
Judge.

2859 And afterwards, to wit, on the 23rd day of October, A. D. 1940, being one of the days of the regular October term of said Court, in the record of proceedings thereof, in said entitled cause, before the Honorable Charles E. Woodward, District Judge, appears the following entry, to wit: Entered Oct. 23, 1940.

2860 IN THE DISTRICT COURT OF THE UNITED STATES.

DECREE.

This cause coming on to be heard on the pleadings herein, the stipulations of the parties filed herein, the report of the Master in Chancery to whom this suit was referred and the evidence taken before him, and the written objections to the said master's report and the Court having heard the arguments of counsel on said objections and being fully advised in the premises,

Doth File herein this day its finding of facts and its conclusions of law duly authenticated by the signature of the judge of this Court, and

Doth Further Order, Adjudge and Decree:

1. That a declaratory judgment be and the same is hereby entered in this cause that the plaintiff's Pure-Pak single-service paper milk bottle is a "standard milk bottle" and that the same conforms with the city ordinances of the City

of Chicago and with the provisions of the State statute of Illinois (Illinois Revised Statutes (1939) Chapter 56½, Paragraph 129, Item 10) and the regulations of the Illinois Department of Health.

2861 2. That the defendants and each of them, and their officers, attorneys, agents, inspectors, employees, and all persons acting in privity with them or any of them, be and they hereby are restrained and enjoined perpetually (or until the further order of this Court) from in any manner or by any means preventing or in anywise interfering with the sale and delivery by the plaintiff, its officers, agents and employees, of milk and milk products in the City of Chicago in less than gallon quantities in the plaintiff's Pure-Pak paper milk bottle; provided that the sale and the delivery of said milk and milk products by the plaintiff in Pure-Pak single-service paper milk bottles conforms with the ordinances of the City of Chicago and the statutes of the State of Illinois. And the Clerk of this Court is hereby directed to issue an injunction under the seal of this Court to the defendants, restraining and enjoining them accordingly.

3. That the Master's fee for his services herein is hereby fixed at the sum of $3500.00, which sum is hereby taxed as costs herein.

4. It appearing that the services of a court reporter were necessary to take down and to transcribe the evidence heard before the Master and that the fair, reasonable and customary charge for said services is the sum of $1284.00, said sum is hereby taxed as costs herein.

5. That said costs as taxed aforesaid (less any amounts heretofore paid by said defendants on account of Master's fee and on account of the attendance of the court reporter before the Master and the original transcript of evi-

2862 dence) be paid by the defendants herein to Jacob I. Grossman, Master in Chancery, within thirty (30) days of this date. The Master shall from said payment, when received, refund to the plaintiff all sums heretofore advanced by the plaintiff on account of Master's fee and on account of the attendance of the court reporter before the Master and the original transcript of evidence.

6. That the plaintiff do have and recover of and from the defendants its costs by it expended herein, to be taxed by the Clerk of this Court and that execution on said judgment for costs issue against the individual defendants here-

in if requested by the plaintiff and that said judgment against the City of Chicago be paid by it in due course of law.

7. That the plaintiff's cash deposit with the Clerk of this Court for costs, less any sum expended therefrom, and less the Clerk's statutory fee be returned by the Clerk to the plaintiff.

Objections to the report of the Master in Chancery standing as exceptions are hereby sustained.

Enter, this 23rd day of October, A. D. 1940.

Charles E. Woodward,
Judge.

2849 And on, to-wit, the 23rd day of October, A. D. 1940, there was in the Clerk's office of said Court a certain Master's Certificate, in words and figures following, to-wit: Filed Oct. 23, 1940.

2850 IN THE DISTRICT COURT OF THE UNITED STATES.

• • (Caption—316) • •

MASTER'S CERTIFICATE.

Shortly after this reference was made the parties requested an early hearing, and hearings were held during the summer and early fall of 1939. The hearings extended during the period from May 31 to October 26, 1939. They were held at times convenient to out of town expert witnesses. The evidence was quite technical. Through suggestions of the Master, agreements were made by which costly experiments which would have taken a number of months, were eliminated. A number of briefs were filed, the last of which was submitted in March, 1940. It was necessary to have a stenographic transcript of the proceeding. The transcript of the testimony, exclusive of exhibits, totaled 2157 pages. The stenographic bill of the parties themselves was $1941.45, including carbons. The total taxable for attendance and original copy of transcript is $1284. This amount has been paid to the stenographers by the parties in proportion to the amount of testimony introduced by them, that is to say, $984.50 by plaintiff and $299.50 by defendant. On account of Master's fees plaintiff advanced $1800 and defendant $650. The Master spent more than 200 hours in exam-

ining pleadings, hearing the evidence, conferring with counsel, reading and considering the voluminous briefs and the evidence, preparing a report and considering
2851 objections, and revising the report. On a finding of the issues in its favor plaintiff is entitled to recover from defendant the amounts advanced by it.

Dated at Chicago, Illinois, this 21st day of October, 1940.

Respectfully submitted,

Jacob I. Grossman,

Jacob I. Grossman,
Master in Chancery.

Filed Oct. 23, 1940.

2863 And on, to-wit, the 23rd day of October, A. D. 1940, came the Defendants, by their attorneys and filed in the Clerk's office of said Court their certain Notice of Appeal in words and figures following, to-wit:

2864 IN THE DISTRICT COURT OF THE UNITED STATES.

For the Northern District of Illinois,

Eastern Division.

Fieldcrest Dairies, Inc., *Plaintiff*, *vs.* City of Chicago, a municipal corporation, Board of Health of the City of Chicago, Dr. Robert A. Black, Health Commissioner and Acting President of Board of Health of the City of Chicago, *Defendants.*	No. 316 In Chancery.

NOTICE OF APPEAL TO CIRCUIT COURT OF APPEALS FOR THE SEVENTH CIRCUIT UNDER RULE 73 (b).

Notice is hereby given that City of Chicago, a municipal corporation, Board of Health of the City of Chicago, Dr. Robert A. Black, Health Commissioner and Acting President of the Board of Health of the City of Chicago, defendants above named hereby appeal to the Circuit Court of Appeals for the Seventh Circuit from the final decree

entered in this action on the 23rd day of October, 1940, which decree embraced a declaratory judgment, appeal from which is hereby taken as well as from all other portions of said decree.

Barnet Hodes,
Corporation Counsel of the City of Chicago, Attorney for said Defendants.
511 City Hall,
Chicago, Illinois.

Alexander J. Resa,
J. Herzl Segal,
L. Louis Karton,
Assistant Corporation Counsel, of Counsel.

2877 And on, to-wit, the 15th day of November, A. D. 1940, came the Defendants-Appellants by their attorneys and filed in the Clerk's office of said Court their certain Statement of Points, in words and figures following, to-wit: Filed Nov. 15, 1940.

2878 In the District Court of the United States.

* * (Caption—316) * *

STATEMENT OF POINTS UPON WHICH APPELLANTS INTEND TO RELY ON APPEAL.

The appellants intend to rely on the following points on appeal to secure a reversal of the decree in this case:

1. The District Court erred in entering a declaratory judgment that the plaintiff's Pure-Pak single-service paper containers is a "standard milk bottle" and that the same conforms with the city ordinances and with the statutes of the State of Illinois and the regulations of the Illinois Department of Health.

2. The District Court erred in refusing to hold that the plaintiff's Pure-Pak single-service paper container is not a "standard milk bottle" within the meaning of the city ordinances of the City of Chicago.

3. The District Court erred in ordering an injunction to issue restraining the defendants from preventing or interfering with the sale and delivery by the plaintiff of milk and milk products in the plaintiff's Pure-Pak paper container.

2879 4. The District Court erred in not dismissing the complaint for want of equity.

5. The District Court erred in not overruling the objections to the report of the master in chancery standing as exceptions.

6. The District Court erred in sustaining the objections to the report of the master in chancery standing as exceptions.

7. The District Court erred in entering judgment against the defendants for plaintiff's costs by it expended herein.

8. The District Court erred in the following findings of fact:

"8. The Pure-Pak paper milk bottle is a standard milk bottle.

"9. The Pure-Pak paper milk bottle contains no new or unusual health hazard and they are safe and sanitary containers for the delivery of milk, cream and milk products.

"10. The Pure-Pak paper bottle conforms to the sanitary and health requirements of the city ordinances of the City of Chicago.

"11. The Pure-Pak paper milk bottle conforms with the provisions of the state statute of Illinois (Illinois Revised Statutes, 1939, chapter 56½, para. 129, item 10), and the regulations of the Illinois Department of Health.

"12. If section 3094 were to be construed to prohibit the use of plaintiff's Pure-Pak paper milk bottle for the delivery of milk in the City of Chicago in less than gallon quantities, said ordinance and without any reasonable basis."

9. The District Court erred in the following conclusions of law:

2880 "4. Section 3094 of the Revised Chicago Code, 1931, as amended (re-enacted August 30, 1939, as Section 154-15 of the Municipal Code of Chicago, 1939, but hereinafter for convenience referred to as 'Section 3094') properly interpreted does not prohibit the delivery of milk or milk products in the plaintiff's 'Pure-Pak' paper milk bottle in quantities of less than one gallon in the City of Chicago.

"5. If Section 3094 were to be construed to prohibit the use of plaintiff's single-service paper containers, said construction would render said provision and requirements of the ordinance void.

"6. The plaintiff is entitled to a declaratory judgment that its said single-service container complies with the ordinances of the City of Chicago.

"7. The plaintiff is entitled to an injunction restraining the defendants, their officers and agents from interfering with plaintiff in the sale and delivery of milk and milk products in said Pure-Pak paper milk bottles.

"8. The plaintiff is equitably entitled to have the costs of this proceeding taxed against and paid by the defendants."

Barnet Hodes,
Corporation Counsel of the City of Chicago; Attorney for said defendants-appellants.

Alexander J. Resa,
J. Herzl Segal,
L. Louis Karton,
Assistant Corporation Counsel,
Of Counsel.

Received a copy of the foregoing statement of points this 15th day of November, 1940.

Fred A. Gariepy, (W. E.)
Attorney for plaintiff-appellee.

2865 IN THE DISTRICT COURT OF THE UNITED STATES.

* * (Caption—316) * *

I, Hoyt King, Clerk of the United States District Court for the Northern District of Illinois, Eastern Division, keeper of the Seal and Records of said Court, do hereby certify that on the 24th day of October, A. D. 1940, I did cause to be mailed to Messrs. Gariepy and Gariepy, Attorneys for the Plaintiff, at One LaSalle Street, Chicago, Illinois, a copy of the Notice of Appeal filed by the defendant, The City of Chicago, a municipal corporation, on October 23, A. D. 1940, in accordance with Rule 73(b) of the Rules of Civil Procedure for the District Courts of the United States, in the above entitled cause.

In Testimony Whereof, I have hereunto subscribed my name and affixed the seal of the aforesaid Court, at Chicago, Illinois, this 7th day of January, A. D. 1941.

Hoyt King,
Clerk.

(Seal)

Filed Oct. 24, 1940.

2872 And on, to wit, the 24th day of October, A. D. 1940 came the Defendants-Appellants by their attorneys and filed in the Clerk's office of said Court their certain Designation of Contents of Short Record on Appeal in words and figures following, to wit:

2873 IN THE DISTRICT COURT OF THE UNITED STATES.

* * (Caption—316) * *

APPELLANTS' DESIGNATION OF CONTENTS OF SHORT RECORD ON APPEAL.

The Clerk of the District Court of the United States, Northern District of Illinois, Eastern Division, is hereby requested to prepare a short record for transmittal to the Circuit Court of Appeals for the Seventh Circuit, said short record to be made up so as to include the following documents:

1. Final decree entered in the above entitled cause on, to wit, October 23, 1940.
2. Notice of appeal filed on, to wit, October 23, 1940.
3. Motion of the defendants filed on, to wit, October 24, 1940 for supersedeas.
4. Notice together with proof of service thereof filed on, to wit. October 24, 1940 of aforesaid motion for supersedeas.
5. Order entered on, to wit, October 24, 1940 denying defendants' motion for supersedeas.
6. This designation of contents of short record on appeal together with proof of service thereof filed on, to wit, October 24, 1940.

Barnet Hodes,
Corporation Counsel of the City of Chicago,
Attorney for said Defendants.

Alexander J. Resa,
J. Herzl Segal,
L. Louis Karton,
Assistant Corporation Counsel.
Dated: October 24, 1940.

Received a copy of the foregoing appellants' designation of contents of short record on appeal this 24th day of October, 1940.

Fred A. Gariepy, (WE)
Attorney for Plaintiff.

2874 And on, to wit, the 8th day of November, A. D. 1940 came the Defendants-Appellants by their attorneys and filed in the Clerk's office of said Court their certain Bond on Appeal, in words and figures following, to wit: Filed Nov. 8, 1940.

2875 IN THE DISTRICT COURT OF THE UNITED STATES.

* * (Caption—316) * *

BOND ON APPEAL.

Know All Men by These Presents, That we, City of Chicago, a municipal corporation, The Board of Health of the City of Chicago, and Dr. Robert A. Black, Health Commissioner and Acting President of the Board of Health of the City of Chicago, as principals, and United States Fidelity and Guaranty Company, a Maryland corporation, as surety, are held and firmly bound unto Fieldcrest Dairies, Inc., a corporation, in the full and just sum of Two Hundred and Fifty Dollars ($250.00) to be paid to the said Fieldcrest Dairies, Inc., a corporation, its attorneys, executors, administrators or assigns; to which payment, well and truly to be made, we bind ourselves and our successors in office, jointly and severally, firmly by these presents. Sealed with our seals and dated this 31st day of October in the year of our Lord One Thousand Nine Hundred and Forty.

Whereas, lately at a session of the District Court of the United States for the Northern District of Illinois, Eastern Division, in a suit pending in said court between Fieldcrest

2876 Dairies, Inc., a corporation, plaintiff, and City of Chicago, a municipal corporation, The Board of Health of the City of Chicago, and Dr. Robert A. Black, Health Commissioner and Acting President of the Board of Health of the City of Chicago, defendants, a decree was rendered against the said City of Chicago, a Municipal corporation, The Board of Health of the City of Chicago, and Dr. Robert A. Black, Health Commissioner and Acting President of the Board of Health of the City of Chicago, and the said City of Chicago, a municipal corporation, The Board of Health of the City of Chicago, and Dr. Robert A. Black, Health Commissioner and Acting President of the Board of Health of the City of Chicago, having filed their

notice of appeal to the United States Circuit Court of Appeals for the Seventh Circuit in the clerk's office of the said District Court to reverse the decree of the aforesaid suit in the United States Circuit Court of Appeals for the Seventh Circuit to be holden at Chicago within forty days from the date hereof.

Now the condition of the above obligation is such, that if the said City of Chicago, a municipal corporation, The Board of Health of the City of Chicago, and Dr. Robert A. Black, Health Commissioner and Acting President of the Board of Health of the City of Chicago, shall prosecute their said appeal to effect, and shall answer all costs that may be awarded against them if they fail to make their plea good, then the above obligation to be void; otherwise to remain in full force and virtue.

City of Chicago, a Municipal Corporation,
By Edward J. Kelly,
(City Seal) *Mayor of the City of Chicago.*

Attest:
Ludwig D. Schreiber,
Clerk of the City of Chicago.

Board of Health of the City of Chicago,
By Herman N. Bundesen,
President.

Attest:
Frances A. Dulak,
Secretary.

United States Fidelity and Guaranty Company, a Maryland corporation,
By Edmond J. Moroney,
(Corp. Seal) *Attorney-in-fact.*

Approved as to Form
Joseph F. Grossman,
First Assistant Corporation Counsel.

2868 And on, to wit, the 24th day of October, A. D. 1940 there was filed in the Clerk's office of said Court a certain Notice, in words and figures following, to wit:

2869 IN THE DISTRICT COURT OF THE UNITED STATES. Filed Oct. 24, 1940.
• • (Caption—316) • •

NOTICE.

To: Gariepy & Gariepy,
1 N. La Salle St.,
Chicago, Illinois.

Please Take Notice that on Thursday, October 24, 1940, at the opening of court in the forenoon or as soon thereafter as counsel may be heard, we shall appear before the Honorable Charles E. Woodward, Judge of the United States District Court and shall move on behalf of the defendants in the above entitled cause that the final decree (including the declaratory judgment therein embraced) heretofore entered on October 23, 1940, be stayed and that the injunction therein granted be suspended during the pendency of the appeal which has been perfected from said decree, and shall move that the supersedeas be effective without the filing of any bond by said defendants and that the court enter such order or orders as it may consider proper pursuant to the powers vested in the court by Rule 62 of the Rules of Civil Procedure for the District Courts of the United States, a copy of which motion is herewith served upon you; at which time and place you may appear if you so see fit.

Barnet Hodes,
Corporation Counsel of the City of Chicago,
Attorney for said Defendants,
511 City Hall, Chicago, Illinois.

Alexander J. Resa,
J. Herzl Segal,
L. Louis Karton,
Assistant Corporation Counsel.

Received a copy of the foregoing notice, together with motion therein referred to this 23rd day of October, A. D. 1940.

Gariepy & Gariepy,
Attorneys for Plaintiff.

Filed Oct. 24, 1940.

2866 And on, to wit, the 24th day of October, A. D. 1940 came the Defendants by their attorneys and filed in the Clerk's office of said Court their certain Motion, in words and figures following, to wit:

2867 IN THE DISTRICT COURT OF THE UNITED STATES.

* * (Caption—316) * *

MOTION.

Now come City of Chicago, a municipal corporation, Board of Health of the City of Chicago, Dr. Robert A. Black, Health Commissioner and Acting President of the Board of Health of the City of Chicago, defendants in the above entitled cause and having heretofore filed their notice of appeal to the Circuit Court of Appeals for the Seventh Circuit from the decree heretofore entered on October 23, 1940, move the court that during the pendency of said appeal said decree (including the declaratory judgment therein embraced) be stayed and that the injunction therein granted be suspended, and further move that by reason of the fact that the defendants are a municipal corporation and officers thereof acting in their official capacities that said defendants be excused from filing any bond as a prerequisite of the supersedeas herein requested, and that the court enter such other and further orders relating to said supersedeas as it considers proper pursuant to the power vested in the court by Rule 62 of the Rules of Civil Procedure for the District Courts of the United States.

Barnet Hodes,
Corporation Counsel of the City of Chicago,
Attorney for said Defendants,
511 City Hall, Chicago, Illinois.

Alexander J. Resa,
J. Herzl Segal,
L. Louis Karton,
Assistant Corporation Counsel,
of Counsel.

2870 And afterwards, to wit, on the 24th day of October, A. D. 1940, being one of the days of the regular October term of said Court, in the record of proceedings thereof, in said entiled cause, before the Honorable Charles E. Woodward, District Judge, appears the following entry, to wit: Entered Oct. 24, 1940.

2871 IN THE DISTRICT COURT OF THE UNITED STATES.

* * (Caption—316) * *

ORDER.

This cause coming on to be heard on defendants' motion, after due notice; and the defendants now moving for a stay of the judgment and suspension of the injunction pursuant to the powers vested in this Court under Rule 62 of the Rules of Civil Procedure for the District Courts of the United States; and the Court being fully advised in the premises and having jurisdiction of the parties and the subject matter,

It Is Ordered that said motion of the defendants for a stay of the judgment and a suspension of the injunction be, and the same is hereby denied.

Enter:

Woodward,
Judge.

October 24, 1940.

2887 And on, to wit, the 15th day of November, A. D. 1940, came the Defendants-Appellants by their attorneys and filed in the Clerk's office of said Court their certain Designation of Portions of Record, Proceedings and Evidence to be contained in the Record on Appeal, in words and figures following, to wit:

2888 IN THE DISTRICT COURT OF THE UNITED STATES.

* * (Caption—316) * *

APPELLANTS' DESIGNATION OF THE PORTIONS OF THE RECORD, PROCEEDINGS AND EVIDENCE TO BE CONTAINED IN THE RECORD ON APPEAL.

The Clerk of the District Court of the United States, Northern District of Illinois, Eastern Division, is hereby requested to prepare the record for transmittal to the Circuit Court of Appeals for the Seventh Circuit, said record to be made up so as to include the following documents:

1. Complaint and exhibit attached thereto filed on, to-wit, February 2, 1939.
2. Plaintiff's Exhibit A filed on, to-wit, February 2, 1939.
3. Answer of defendants filed on, to-wit, February 27, 1939 with exhibits attached thereto.
4. Order entered on, to-wit, May 12, 1939 referring the cause to Master Grossman.
5. All depositions filed on, to-wit, May 24, 1939, or in lieu thereof a condensed statement in narrative form of the testimony contained in said depositions if the same be furnished by the parties hereto.
6. Notice filed on, to-wit, May 25, 1939.
7. Order approving stipulation entered on, to-wit, May 25, 1939.
7. Order approving stipulation entered on, to-wit, May 25, 1939.
8. Stipulation filed on, to-wit, June 29, 1939.

2889 9. Order approving stipulation entered on, to-wit, June 29, 1939.

10. Master's report filed on, to-wit, April 27, 1940.
11. Objections to depositions filed on, to-wit, April 27, 1940.
12. All of the plaintiff's and defendants' exhibits filed on, to-wit, April 27, 1940.
13. Transcript of testimony before the master in chancery consisting of three volumes filed on, to-wit, April 27, 1940, or in lieu thereof a condensed statement in narrative form of all or part of the testimony if the same be furnished by the parties hereto.
14. Notice and objections to final and modified report of the master in chancery filed on, to-wit, May 7, 1940.

15. Notice filed on, to-wit, May 14, 1940.
16. Motion of defendants filed on, to-wit, May 14, 1940.
17. Order entered on, to-wit, May 14, 1940.
18. Memorandum of Woodward, District Judge, filed on, to-wit, October 18, 1940.
19. Master's certificate filed on, to-wit, October 23, 1940.
20. Findings of fact filed on, to-wit, October 23, 1940.
21. Conclusions of law filed on, to-wit, October 23, 1940.
22. Final decree entered on, to-wit, October 23, 1940.
23. Notice of appeal filed on, to-wit, October 23, 1940.
24. Proof of service of notice of appeal.
25. Motion of defendants for supersedeas filed on, to-wit, October 24, 1940.
26. Notice filed on, to-wit, October 24, 1940.
27. Order entered on, to-wit, October 24, 1940 denying motion for supersedeas.

2890 28. Designation of contents of short record on appeal together with proof of service thereof filed on, to-wit, October 24, 1940.

29. Cost bond on appeal filed on, to-wit, November 8, 1940.
30. This designation of contents of the record on appeal.
31. Statement of points on which defendants intend to rely on the appeal to be filed herein.
32. Any documents hereafter filed, orders hereafter entered, or proceedings hereafter had in this case prior to the transmittal of the record to the Circuit Court of Appeals.

Dated: November 15, 1940.

Barnet Hodes,
Corporation Counsel of the City of Chicago, Attorney for said defendants-appellants.

Alexander J. Resa,
J. Herzl Segal,
L. Louis Karton,
Assistant Corporation Counsel,
Of Counsel.

Received a copy of the foregoing designation of contents of record on appeal this 15th day of November, 1940.

Fred A. Gariepy,
Attorney for plaintiff-appellee.

Entered Nov. 28, 1940.

2881 And afterwards, to wit, on the 28th day of November, A. D. 1940, being one of the days of the regular November term of said Court, in the record of proceedings thereof, in said entitled cause, before the Honorable Charles E. Woodward, District Judge, appears the following entry, to wit:

2882 IN THE DISTRICT COURT OF THE UNITED STATES.

• • (Caption—316) • •

Thursday, November 28, A. D. 1940.

Present: Hon. Charles E. Woodward, District Judge.

This cause coming on to be heard upon the motion of the defendant by its attorneys to extend the time to file the record on appeal to and including January 20, A. D. 1941 It Is Ordered that said motion be and the same is hereby allowed and the time to file the record on appeal in the Circuit Court of Appeals for the Seventh Circuit be and the same is hereby extended to and including January 20, A. D. 1941.

Filed Jan. 13, 1941.

2883 And on, to wit, the 13th day of January, A. D. 1941, there was filed in the Clerk's office of said Court a certain Stipulation in words and figures following, to wit:

2884 IN THE DISTRICT COURT OF THE UNITED STATES.

• • (Caption—316) • •

STIPULATION.

It is stipulated by and between the parties hereto by their attorneys that all original documentary exhibits received in evidence on behalf of the plaintiff and the defendants may be incorporated and used in the record in this cause on appeal to the Circuit Court of Appeals for the Seventh Circuit.

It is hereby stipulated by and between the parties hereto by their attorneys that the original depositions of Paul V. Keyser, Jr. and Herbert M. Packer, Elkan H. Yunker,

Florence Johnston and A. E. Carpenter, filed in this cause on May 24, 1939, may be used in the transcript of the record on appeal in lieu of copies thereof.

Barnet Hodes,
Corporation Counsel of the City of Chicago,
By James A. Velde,
Assistant Corporation Counsel, Attorney for Defendants.

Gariepy & Gariepy,

Plaintiff-Appellee,
vs.
City of Chicago, a municipal corporation, et al.,
Defendants-Appellants.
} No. 7502.

STIPULATION.

It Is Hereby stipulated by and between the parties hereto, by their attorneys, that the Clerk of the Circuit Court of Appeals, in printing the record, may make the following omissions:

1. Plaintiff's Exhibit B attached to complaint filed in the District Court on February 2, 1939 and defendants' Exhibit 24 filed in the District Court on April 27, 1940 may be omitted and in the place of each exhibit an appropriate

notation may be inserted by the clerk to the effect that the exhibit omitted appears in the record as Exhibit A attached to the answer of the defendants filed in the District Court on February 27, 1939.

2. Two documents in the record filed in the District Court on April 27, 1940, one entitled "List of Plaintiff's Exhibits" and the other "List of Defendants' Exhibits" may be omitted.

3. Plaintiff's Exhibit 15 may be omitted with an appropriate notation inserted in its place that the exhibit appears in the record as Figures 2 and 3 of Plaintiff's Exhibit 12.

4. Plaintiff's Exhibit 15 marked "Withdrawn" may be omitted.

5. Plaintiff's Exhibit 20 may be omitted with an appropriate notation inserted in its place that the exhibit appears in the record as part of Plaintiff's Exhibit 4.

6. Except for the front cover sheet, all of Plaintiff's Exhibit 42 may be omitted.

7. Defendants' Exhibit 28 may be omitted with an appropriate notation inserted in its place that the exhibit appears in the record as the stipulation filed in the District Court on June 29, 1939.

UNITED STATES CIRCUIT COURT OF APPEALS

For the Seventh Circuit.

I, Kenneth J. Carrick, Clerk of the United States Circuit Court of Appeals for the Seventh Circuit, do hereby certify that the foregoing printed pages contain a true copy of Volume 3 of the printed record, printed under my supervision, and filed on the twenty-first day of February, 1941, which, together with Volumes 1 and 2, constitutes the record in the following entitled cause:

Cause No. 7502.

Fieldcrest Dairies (Inc.),
Plaintiff-Appellee,

vs.

City of Chicago (a Municipal Corporation), Board of Health of the City of Chicago, Dr. Robert A. Black, Health Commissioner and Acting President of Board of Health of the City of Chicago,
Defendants-Appellants,

as the same remains upon the files and records of the United States Circuit Court of Appeals for the Seventh Circuit.

In Testimony Whereof I hereunto subscribe my name and affix the seal of said United States Circuit Court of Appeals for the Seventh Circuit, at the City of Chicago, this 5th day of September, A. D. 1941.

Kenneth J. Carrick,
(Seal) *Clerk of the United States Circuit Court of Appeals for the Seventh Circuit.*

At a regular term of the United States Circuit Court of Appeals for the Seventh Circuit held in the City of Chicago and begun on the first day of October in the year of our Lord one thousand nine hundred and forty of our Independence the one hundred and sixty-fifth.

Fieldcrest Dairies (Inc.),
Plaintiff-Appellee,
vs.
City of Chicago (a Municipal Corporation), Board of Health of the City of Chicago, Dr. Robert A. Black, Health Commissioner and Acting President of Board of Health of the City of Chicago,
Defendants-Appellants.

No. 7502

Appeal from the District Court of the United States for the Northern District of Illinois, Eastern Division.

And, to-wit: On the fourth day of August, 1941, there was filed in the office of the Clerk of this Court, the Opinion of the Court, which said Opinion is in the words and figures following, to-wit:

IN THE UNITED STATES CIRCUIT COURT OF APPEALS

For the Seventh Circuit.

No. 7502. **October Term, 1940, April Session, 1941.**

FIELDCREST DAIRIES (Inc.), *Plaintiff-Appellee,*

vs.

CITY OF CHICAGO (a Municipal Corporation), BOARD OF HEALTH OF THE CITY OF CHICAGO, DR. ROBERT A. BLACK, Health Commissioner and Acting President of Board of Health of the City of Chicago, *Defendants-Appellants.*

Appeal from the District Court of the United States for the Northern District of Illinois, Eastern Division.

August 4, 1941.

Before SPARKS and MAJOR, *Circuit Judges*, and LINDLEY, *District Judge*.

MAJOR, *Circuit Judge*. This appeal is from a declaratory judgment decree in favor of plaintiff and awarding an injunction against defendants, entered October 23, 1940. The suit was commenced by a bill of complaint, filed February 2, 1939, which sought a judicial declaration that a milk ordinance of the City of Chicago, requiring milk to be delivered in "standard milk bottles" did not prohibit the sale of milk in plaintiff's paper containers, or that, if it does, the ordinance is invalid. An injunction was also sought restraining the defendants from interfering with the sale of milk in such containers. A hearing was had before a Master who recommended a denial of the relief sought. The court sustained objections to the Master's report and entered the decree in controversy.

Thus, the issues for decision are: (1) Does the ordinance forbid the delivery of milk in plaintiff's paper containers, and (2) if so, is the ordinance valid. Under the latter issue it is contended that any power which the City Council of the City of Chicago might have had to prohibit the sale of milk in such containers was withdrawn by an Act of the Illinois Legislature enacted in 1939, and, irrespective of this, that the ordinance was and is so unreasonable and arbitrary, both as a matter of law and fact, as to make it invalid.

The Master decided all issues in favor of the defendants, while the court concluded that plaintiff's container was a standard milk bottle within the meaning of the ordinance, and further concluded that any other construction of the ordinance would render it void.

Before discussing the merits of the issues presented, it is appropriate to state that the Master made a number of purported findings of fact which, in part at least, were not accepted by the court. The defendants contend that the court was obligated under Rule 53 (e) (2) of the Federal Rules of Civil Procedure to accept such findings "unless clearly erroneous." We think it is unnecessary to discuss to what extent, if any, this rule should be given application for the reasons: (1) The purported findings are in the nature of conclusions rather than findings of fact, and (2) for the more important reason that we have reached the conclusion that the cause should be disposed of on a legal rather than factual basis.

On January 4, 1935, there was enacted by the City Council of the City of Chicago, an ordinance regulating the production and distribution of milk in the city. Shortly thereafter there was promulgated by the Chicago Board of Health, regulations in conformity therewith. The provision of the ordinance now under attack is the third sentence of Section 3094:

> "Any milk or milk products sold in quantities of less than one gallon shall be delivered in standard milk bottles; provided, however, that nothing herein contained shall be construed to prohibit hotels, soda fountains, restaurants, and similar establishments from dispensing milk or milk products from sanitary dispensers approved by the board of health."

Prior to the institution of suit, plaintiff repeatedly sought from the Chicago Board of Health a permit to

retail milk in the city which was denied on the ground that the container in which plaintiff proposed to deliver its milk was not a "standard milk bottle" within the meaning of the ordinance. Thus, the first issue in dispute revolves solely around the interpretation of those words as used in the ordinance. It is the contention of the plaintiff, sustained by the lower court, that such words should be construed to include its paper container, while the defendants contend that they should be construed to include glass bottles only.

Any detailed description of plaintiff's business, or the process employed in the manufacture of plaintiff's container appears irrelevant to a construction of the ordinance. At this point, therefore, we make only a brief reference to the same. Plaintiff, a wholly owned subsidiary of the Dean Milk Company, a Corporation, is engaged in the distribution of milk and milk products. Its plant is located at Chemung, McHenry County, Illinois, where it has two machines leased from the Ex-Cell-O Corporation, used for packaging milk in paper containers bearing the trade name "Pure-Pak." Its facilities are such that it is unable to use glass bottles. Its container is manufactured from paper obtained from a mill in West Virginia. The paper is cut, trimmed and printed at a manufacturing plant located in Ohio. The product is shipped to plaintiff's plant and assembled into the type of containers now in controversy. Such containers are commonly and, we think, generally referred to by Governmental officials and those interested in the trade as "Single Service Containers." This follows from the fact that they are destroyed after a single use. Thus they are distinguished from a multi-container, such as a glass bottle, which may be used many times. The court adopted the Master's description of plaintiff's container:

> "Plaintiff's container is a prismatic box about 6½ inches high and 4½ inches wide, with a gable top, made of paper and paraffined on the inside and outside. In the middle of one of the slanting surfaces of the gable top is a so-called pouring lip which is about an inch square and which is pulled out like an ear when milk is to be poured out of the container."

The court, in construing the words "standard milk bottle" as including plaintiff's container, relied strongly upon two factors: (1) The situation existing in the trade at the

time of trial rather than at the time the ordinance was enacted, and (2) the definition of the word "bottle" as given by numerous Lexicographers. As to the first factor, the court said:

> "* * * The ordinance is not static. The words are general and continuing in their operation. The ordinance must be construed in the light of new and changing conditions and current thought and practice. If, in the course of time, the advancement of science has produced a container which serves the same purpose as a glass container, and if the product delivered therein conforms to the requirements of sanitation prescribed by the health ordinances, then the ordinance must be given such construction as to permit the use of the later developed scientific container."

We are of the view that this was an unsound basis upon which to predicate a construction of the ordinance. As was said in *Sup* v. *Cervenka,* 331 Ill. 459, 462:

> "* * * The courts have no legislative powers, and in the interpretation and construction of statutes their sole function is to determine, and within the constitutional limits of the legislative power to give effect to, the intention of the legislature. * * *"

and in *United States* v. *Goldenberg,* 168 U. S. 95, 102:

> "The primary and general rule of statutory construction is that the intent of the lawmaker is to be found in the language that he has used. He is presumed to know the meaning of words and rules of grammar. The courts have no function of legislation, and simply seek to ascertain the will of the legislator. * * * No mere omission, no mere failure to provide for contingencies, which it may seem wise to have specifically provided for, justify any judicial addition to the language of the statute. * * *"

In *United States* v. *First National Bank,* 234 U. S. 245, referring to facts subsequent to the enactment as bearing upon its construction, the court, on page 259, said:

> "* * * But these after facts can have little weight in determining the meaning of the legislation and certainly cannot overcome the meaning of plain words used in legislative enactments. * * *"

That the language of a legislative enactment is to be construed in accordance with its meaning at the time used

rather than by a meaning afterwards acquired, was held in *People* v. *Barnett*, 319 Ill. 403. On page 408, the court said:

> "• • • The true rule is that statutes are to be construed as they were intended to be understood when they were passed. Statutes are to be read in the light of attendant conditions and that state of the law existent at the time of their enactment. The words of a statute must be taken in the sense in which they were understood at the time the statute was enacted. • • •
>
> "The legislative intent that controls in the construction of the statute has reference to the legislature which passed the given act. • • • In interpreting a statute the question is what the words used therein meant to those using them. • • •"

A municipal ordinance is to be tested in the same manner as a state statute. *Pacific States Company* v. *White*, 296 U. S. 176, 186; *The People* v. *Chicago Rys. Co.*, 270 Ill. 87, 105. Thus the theory of construction advanced by the plaintiff, apparently followed by the District Court, to the effect that the words "standard milk bottle" should be interpreted in accordance with the meaning of those words at the time of trial rather than their meaning at the time the ordinance was enacted, is not tenable. The recognition of such a theory would, in effect, impose legislative functions upon the courts. It would mean that a legislative enactment might mean one thing today and something else tomorrow. Changed conditions, of course, may make advisable a repeal or modification of existing legislation, but if so, the appeal should be to the legislature and not the courts.

We therefore must consider the language employed by the City Council in the enactment of the ordinance in the light of conditions as they existed at that time. The record discloses that the glass milk bottle, similar to those in general use at that time, was invented in 1884, and that for many decades milk in less than gallon quantities had been delivered in the City of Chicago in such bottles. Their general appearance, size and shape have been substantially the same for a half century. On the other hand, the use of paper containers was scarcely known when the ordinance was enacted. True, their development began about 1928, but they first came into general use in the East-

ern states about 1938. Since that time their use has rapidly increased in all parts of the country, including the area adjacent to the City of Chicago.

Plaintiff argues that under such circumstances it could not have been the intent of the City Council in 1935, to exclude the use of paper containers. It is possible and, we think, likely that this is correct. The question, however, is what it intended to permit rather than what it intended to exclude. To us it is readily apparent that what the City Council did mean and intend by use of the words "standard milk bottle" was the glass bottle at that time in universal use. The language employed in the ordinance itself lends support to this view. We have quoted heretofore that portion of the ordinance directly involved in this controversy and it is pertinent to point out that in other portions of the ordinance the word "containers" is employed. For instance, in referring to quarantine premises, the ordinance states: "No milk bottle or other containers may be taken out of or away * * *." There was no occasion to use the words "other containers" if they were included in the words "milk bottles." The use of the words "milk bottle or other containers" is inconsistent with an intent that the latter was included in the former. The omission of the latter from the provision in controversy is therefore significant.

That a standard milk bottle has generally been recognized as not including a paper container or a single service container is well near conclusively demonstrated by the record. A number of witnesses who testified for the plaintiff recognized the distinction. In the same year the ordinance was passed, the United States Biennial Census of Manufacturers was taken, in which glass products were divided into three classifications, one of which was glass containers, and milk bottles were listed as one of the classes of glass containers. Under date of January 13, 1936, the Dean Milk Company (of which the plaintiff is the wholly-owned subsidiary) wrote the Board of Health that they would like to present the facts about "delivering milk to the City of Chicago in paper containers instead of bottles." Certainly there was no thought at that time that milk bottles included paper containers. The United States Public Health Service construed "standard milk bottle" to exclude paper containers. In June, 1939, its model ordinance was amended by adding "or in single service

containers" after "standard milk bottles." If the latter included the former, there was, of course, no occasion for the amendment. On August 2, 1938, the sales manager of the manufacturer of the machines used by the plaintiff for filling the containers, in a letter to the Board, referring to the ordinance, stated:

> "True, its fundamental principles were written a good many years ago, and would not include the present, more sanitary milk receptacle—because it was then unknown."

The court, after quoting numerous lexicographers as to the definition of the word "bottle," stated:

> "* * * While, in modern times, bottles have usually been made of glass, yet of the material out of which bottles have been made may be mentioned, besides glass and skins, hard stone, wood, ivory, bone, porcelain, glazed pottery and common earthenware. In fact, a bottle is not characterized by the material out of which it is made. * * *"

This reasoning, in our judgment, overlooks the fact that the language employed must be interpreted according to its usual and ordinary meaning. It could not be logically contended that the "standard milk bottle" referred to in the ordinance included a bottle made of skins, stone, wood, bone, or the numerous other articles out of which bottles, according to the lexicographers, have sometimes been made. We are not to search for that which possibly could have been included in the language employed, but must ascertain what was intended under the existing circumstances and conditions. Whatever meaning the word "bottle" might have had in ancient times, there can be no question in our mind but that in modern times it has generally been recognized as made of glass, and this has been the universal meaning as applied to a milk bottle.

The Master found the words "standard milk bottle" specified in the ordinance to be:

> "A glass bottle of the type, shape and proportions well known to the trade and the community in Chicago as having been used for many years for the delivery of milk at retail."

It is our judgment that the Master's conclusion in this respect was correct. It follows that the use of plaintiff's paper containers for the delivery of milk in the City of Chicago was prohibited by the ordinance.

We now consider the attack made upon the validity of the ordinance. While we have construed the ordinance in the light of the situation existing at the time of its passage, a different test is permitted and, in fact, required in determining its validity at the time of trial. As was said in *Chastleton Corp.* v. *Sinclair*, 264 U. S. 543, 547:

> "* * * A law depending upon the existence of an emergency or other certain state of facts to uphold it may cease to operate if the emergency ceases or the facts change even though valid when passed. *Perrin* v. *United States*, 232 U. S. 478, 486, 487. *Missouri* v. *Chicago, Burlington & Quincy R. R. Co.*, 241 U. S. 533, 539, 540. In *Newton* v. *Consolidated Gas Co.*, 258 U. S. 165, a statutory rate that had been sustained for earlier years in *Wilcox* v. *Consolidated Gas Co.*, 212 U. S. 19, was held confiscatory for 1918 and 1919."

This rule was recognized in *Perrin* v. *United States*, 232 U. S. 478, 487:

> "* * * The fact that the conditions may become so changed in the future as to render the prohibition inoperative affords no reason for condemning it now. * * *"

Moreover, where the public policy of a state has been declared in the interim between the judgment of the lower court and appeal here, we are bound to give recognition to such policy. *Vandenbark* v. *Owens-Illinois Glass Co.*, 311 U. S. 538, 543. Under this view we need not consider or decide the validity of the ordinance at the time of its enactment. The question for consideration is whether the ordinance now contravenes the public policy of the State of Illinois, and whether so or not, was the situation at the time of the institution of suit so altered as to make the prohibition contained in the ordinance unreasonable and void. On these questions, as well as others, the Master found in favor of the defendants. In deciding to the contrary, the court, as already pointed out, placed its chief reliance upon a construction of the ordinance as including plaintiff's paper container. The court also held:

> "Any other construction would render the ordinance void. Moreover, the Court is of opinion that under the recent statute of Illinois, heretofore referred to, the city is without power to prohibit the use of single service containers if such containers conform with the provisions of the statute."

The Illinois Legislature on July 24, 1939, during the pendency of this suit, enacted legislation (Illinois R. S. 1939, Ch. 56½, Foods, Pars. 115-134) which plaintiff contends established a policy for the state concerning the manufacture and distribution of pasteurized milk, including its distribution in single service containers. The Statute is lengthy and there seems no occasion to set it forth verbatim. It is sufficient to point out that it provides for the issuance of a Certificate of Approval to a pasteurization plant whose methods of operation comply with the numerous requirements of the Act. It also requires compliance "in accordance with minimum requirements adopted by the Director for interpretation and enforcement of this Act." (The Act defines "Director" as meaning the Director of the Department of Public Health.) Item 10 of Sec. 15 provides in part:

> "* * * Single service containers, caps, gaskets and similar articles shall be manufactured and transported in a sanitary manner."

Item 18 of the same section provides:

> "Bottling or packaging of milk and milk products shall be done at the place of pasteurization by approved mechanical equipment."

Pursuant to the power conferred by the Act, the Director of the Illinois Department of Public Health has promulgated "minimum requirements" for interpretation and enforcement of the Act. Among other things required are that single service containers shall be manufactured and handled in accordance with the requirements of the Department. The character of the buildings and rooms in which such containers are manufactured, packed, stored and handled, is prescribed. The average maximum bacterial count of the stock from which such containers are made is stated, and it is required that all operations in the fabrication plant, and during their transportation, shall be conducted so as to reduce to a minimum the possibility of contaminating such articles. It is required that all single service containers "shall be so treated as to be as impervious to milk and milk products as practicable."

There is no room for doubt but that the State, by this Act, as well as by the regulations promulgated pursuant thereto, has undertaken to regulate the pasteurization of milk, as well as its sale and distribution. It is equally

plain that the use of single service containers such as used by the plaintiff for the distribution of milk is permitted and approved upon compliance with the Act.

The authorities are uniform that any ordinance which conflicts with any statute or public policy adopted by the State Legislature is invalid. The rule is aptly stated in 2 McQuillin on Municipal Corporations, 572:

> "A Municipal corporation cannot, without special authority, prohibit what the policy of a general statute permits. Nor, on the other hand, can an ordinance permit that which the State's policy forbids. Consequently under a general grant of power, a municipal corporation cannot adopt ordinances 'which infringe the spirit, or are repugnant to the policy, of the state as declared in its legislation.' It thus follows that if the state has expressed through legislation a public policy with reference to a subject, a municipality cannot ordain in respect to that subject to an effect contrary to, or in qualification of the public policy so established. * * *"

Such rule has been recognized by the Illinois courts. *City of Chicago* v. *Union Ice Cream Mfg. Co.*, 252 Ill. 311, 315; *City of Chicago* v. *Drogasawacz*, 256 Ill. 34, 37; *City of Marengo* v. *Rowland*, 263 Ill. 531, 534. In the Marengo case the court said:

> "* * * Municipal authorities, under general grant of power, cannot adopt ordinances which infringe the spirit of a State law or are repugnant to the general policy of the State. * * *"

It is also well established that the General Assembly may resume at any time the power previously delegated to a municipality. *Wilkie* v. *City of Chicago*, 188 Ill. 444, 452.

Thus, we are confronted with a situation wherein the State on the one hand has expressly recognized and made provision for the use of a single service container for the sale and distribution of milk upon compliance with the requirements of the Act, and regulations lawfully promulgated in conformity therewith, and on the other hand, with the provision of the City Ordinance which prohibits such use. Plaintiff has complied with the State requirements and has been issued a Certificate of Approval. By this token it has been authorized by the state to sell and distribute its product within the confines of Illinois in single

service containers. The City of Chicago, however, by the prohibition contained in its ordinance, denies to plaintiff this right conferred by the State.

The defendants, however, in defense of this apparent repugnancy, rely upon Sec. 19 of the 1939 Act, which reads:

> "Nothing in this act shall impair or abridge the power of any city, village or incorporated town to regulate the handling, processing, labeling, sale or distribution of pasteurized milk, and pasteurized milk products, provided such regulation (does) not permit any person to violate any of the provisions of this act."

The title of the 1939 Act is:

> "An Act regulating the handling, processing, labeling, sale and distribution of pasteurized milk and pasteurized milk products."

Thus it will be noted that the language of the saving clause reserves to the city the right to regulate the same matters described in the title of the Act.

It is contended by the defendants that by this saving clause the city retains unimpaired the broad field of regulation which it theretofore had as recognized in *Koy* v. *City of Chicago*, 263 Ill. 122, and *City of Chicago* v. *Bowman Dairy Co.*, 234 Ill. 294. It is claimed that there is only one limitation in the saving clause and that is the proviso that the city shall "not permit any person to violate any of the provisions of this Act." Frankly, we are unable to conceive the purpose of these words. Certainly the city is without authority to permit the violation of the statute under discussion, or any other. The prohibition in this respect is meaningless. We think the words must be regarded as surplusage.

Furthermore, we are of the opinion that the purpose of the saving clause was not as broad as claimed by the defendants, notwithstanding that its language furnishes some support for such contention. The courts of Illinois have frequently recognized that power exercised by municipalities may be conferred or withdrawn by implication. *Village of Atwood* v. *Cincinnati, Indianapolis and W. R. Co.*, 316 Ill. 425; *Stowell* v. *Prentiss*, 323 Ill. 309, 319.

It therefore appears reasonable that the sole purpose of

the saving clause was to prevent a construction by implication, withdrawing the vast authority which the city had theretofore had over the milk industry. The ordinance of the City of Chicago and regulations of its Board of Health disclose scores of ways and means by which the industry is regulated, extending from the health of the cow producing the milk, to its delivery at the home of the consumer. The purpose of the saving clause, in our judgment, was to preserve in the city the unquestioned right to continue in a field which had been entered by the state, and in which, thereafter, each should have co-extensive power and authority. The defendants' contention, if sustained, would give the city a power broader than that provided by the Legislature for the state. It would make the state subservient to the city. It would impute to the Legislature the purpose of withdrawing the power theretofore exercised by the city and by the saving clause reconferring such power. We are unable to believe that such an incongruous result was intended. As was said in *Elsenau* v. *City of Chicago*, 334 Ill. 78, 81:

> "* * * A statute which grants powers to a municipal corporation is strictly construed, and any fair or reasonable doubt of the existence of an asserted power is resolved against the municipality which claims the right to exercise it. * * *"

Neither do we agree with the defendants' argument that the prohibition of plaintiff's single service container is a mere regulation. It is true that all regulations are prohibitory in nature to those who are unable to comply therewith, and that the prohibition of plaintiff's container may be considered a regulation as it pertains to the sale and distribution of milk. However that may be, the state, upon entering the field not only made provision for the sale and distribution of pasteurized milk but recognized, permitted and approved the use of such containers, and the ordinance is squarely in conflict therewith. That the city, by virtue of the saving clause, has the power to regulate paper containers, we have no doubt, but we are unable to accept the theory that it has authority to outlaw that which the state has legalized. We therefore are of the opinion that the portion of the ordinance prohibiting plaintiff from distributing milk in single service containers is contrary to the public policy of the state, and void.

Having thus concluded, we find no occasion to discuss at length or decide other controverted questions as to the validity of the ordinance. We are not unmindful of the broad power possessed by a legislative body, of the strong presumption of legality attaching to their acts, and that it is not within the province of a court to substitute its judgment for theirs as announced in the many cases cited and relied upon by the defendants. Such authorities, however, have no application in view of what we have decided. Moreover, it appears that the presumption in favor of validity could be little more than a shadow in the instant matter for the reason that the use of single service containers was in its incipient stage when the ordinance was enacted, and the legislative body could not, from the nature of things, have considered and weighed their advantages and disadvantages.

It is true the record discloses some evidence in support of defendants' contention that the use of such containers presents a hazard to health. Such evidence, however, carries little, if any, conviction when considered in connection with the fact that the United States Public Health Service, whose model ordinance has been widely adopted by cities throughout the United States, including the City of Chicago, amended its ordinance in 1939, so as to include the regulation of single service containers, and that such amendment was subsequently proposed to the Council of the City of Chicago by its Board of Health; that the Legislature of the State of Illinois and its Department of Health have approved the use of such containers since 1939, and that their use has been authorized and permitted by more than 200 cities and villages in the United States, including such cities as Washington, D. C., New York and Philadelphia, as well as practically all of the cities and villages near and adjacent to the City of Chicago.

From what we have decided, it follows plaintiff was entitled to a declaratory judgment that the ordinance prohibiting the use of its Pure-Pak Single Service Container was void. It also follows that plaintiff was entitled to an injunction restraining the defendants from prohibiting, but not from regulating, the use of such containers. The cause is therefore reversed and remanded for the sole purpose of modifying the decree so as to conform with the views herein expressed.

LINDLEY, *District Judge*, Dissenting in part:

I regret that I am unable to agree that the ordinance violates the public policy of Illinois as expressed in Illinois Revised Statutes, 1939, Chap. 56½, Section 115-134.

Under *Koy* v. *City of Chicago*, 263 Ill. 122 the authority of Illinois cities to regulate the sale and distribution of milk includes power to declare the means by which purity, wholesomeness and freedom from disease shall be secured; to require milk containers to be of prescribed character and to protect the public generally in the sale and distribution of milk. This municipal authority, thus defined by the Supreme Court, is still lodged in the city unless there is something in the statute mentioned which has expressly or impliedly withdrawn it.

The statute does not direct the use of paper milk bottles. It inferentially recognizes that single service containers of some character will be employed but there is no provision that cities must permit them to be used. The whole effect of the enactment is that if "single-service" containers are used they shall conform to certain minimum requirements to be prescribed by the Illinois Department of Public Health. To my mind this legislation did not take from the city power to determine whether paper milk bottles were reasonably possibly dangerous to health and therefore should not be used. Indeed, the legislature apparently recognized the retained police power of the city in the provision that nothing in the act "shall impair or abridge the power of any city * * * to regulate the handling * * * and sale of pasteurized milk." This language, it seems to me, was not meaningless or surplusage, as announced in the majority opinion, but rather in the nature of a declaratory clause maintaining the existing status, inserted by the legislature in an abundance of caution, to assure municipalities that their power to act in the premises was not taken away, provided their ordinances should not in any way conflict with the provisions of the statute.

To my mind this is far afield from those cases where the legislature has entered the field and by its action taken over all the police power upon any specific subject such as confronted the court in *Northern Trust Company*, 318 Ill. 402 and *City of Chicago* v. *Jensen*, 331 Ill. 129. In case of such complete occupation of the range there is no area left in which the city may legitimately operate. Here the state

has apparently left to the city the right to determine whether paper milk bottles shall or shall not be used. The language of *City of Chicago* v. *Union Ice Cream Co.*, 252 Ill. 311 is pertinent.

The Master found upon substantial evidence a number of facts bearing upon the undesirability of use of paper milk bottles, showing clearly that at least the question of desirability of their use is debatable. In such case the city council is entitled to exercise its own administrative and legislative judgment,—a judgment not to be superseded by verdict of a jury or decision of a court. *Carolene Products Co.* v. *Evaporated Milk Assn.*, 93 F. (2d) 202 (CCA7); *United States* v. *Carolene Products Co.*, 304 U. S. 144; *U. S.* v. *Morgan*, ... U. S. ....., 61 Sup. Ct. Rep. 999. See annotation 119 A. L. R. 243.

I think the ordinance should be sustained.

No. 7502 *vs.*

City of Chicago (a Municipal Corporation), Board of Health of the City of Chicago, Dr. Robert A. Black, Health Commissioner and Acting President of Board of Health of the City of Chicago, *Defendants-Appellants.*

Appeal from the District Court of the United States for the Northern District of Illinois, Eastern Division.

This cause came on to be heard on the transcript of the record from the District Court of the United States for the Northern District of Illinois, Eastern Division, and was argued by counsel.

On Consideration Whereof: It is ordered, adjudged and decreed by this Court that the Decree of the said District Court in this cause appealed from be, and the same is hereby, reversed, and that this cause be, and it is hereby remanded to the said District Court for the sole purpose of modifying the decree so as to conform with the views expressed in the opinion of this Court filed in this cause.

It is further ordered that the costs of this appeal be taxed against the Appellants.

And afterwards, to-wit: On the twenty-third day of August, 1941, the following further proceedings were had and entered of record, to-wit:

Saturday, August 23, 1941.

Court met pursuant to adjournment.

Before:

Hon. Otto Kerner, Circuit Judge.

Fieldcrest Dairies (Inc.), *Plaintiff-Appellee,*
No. 7502 *vs.*
City of Chicago, *et al.*, etc. *Defendants-Appellees.*

Appeal from the District Court of the United States for the Northern District of Illinois, Eastern Division.

On motion of counsel for appellants, It is ordered that the Mandate in this cause be, and it is hereby stayed pursuant to Rule 25 of this Court.

And afterwards, to-wit: On the twenty-sixth day of August, 1941, there was filed in the office of the Clerk of this Court, a Designation of Record, which said Designation is in the words and figures following, to-wit:

IN THE UNITED STATES CIRCUIT COURT OF APPEALS

For the Seventh Circuit.

Fieldcrest Dairies, Inc., a corporation, *Plaintiff-Appellee,*

vs.

City of Chicago, a municipal corporation, Board of Health of the City of Chicago, Dr. Robert A. Black, Health Commissioner and Acting President of the Board of Health of the City of Chicago, *Defendants-Appellants.* } No. 7502.

DESIGNATION OF PORTIONS OF RECORD.

The Clerk of the Circuit Court of Appeals for the Seventh Circuit is hereby requested to prepare a transcript of the record for transmittal to the Supreme Court of the United States, the transcript to be made up to include the following documents filed in the Circuit Court of Appeals:

1. Printed record of proceedings in the District Court of the United States for the Northern District of Illinois, Eastern Division, filed January 20, 1941.
2. Judgment of the Circuit Court of Appeals entered August 4, 1941.
3. Opinion my Major, Circuit Judge, and the dissenting opinion of Lindley, District Judge, both filed August 4, 1941.
4. Order for stay of mandate entered August 23, 1941.

Barnet Hodes,
Corporation Counsel of the City of Chicago, Attorney for Defendants-Appellants.

Endorsed: Filed August 26, 1941. Kenneth J. Carrick, Clerk.

UNITED STATES CIRCUIT COURT OF APPEALS

For the Seventh Circuit.

I, Kenneth J. Carrick, Clerk of the United States Circuit Court of Appeals for the Seventh Circuit, do hereby certify that the foregoing printed pages contain a true copy of proceedings had and papers filed, made in accordance with the Designation of Record, in

Cause No. 7502.

Fieldcrest Dairies (Inc.),
Plaintiff-Appellee,

vs.

City of Chicago (a Municipal Corporation), Board of Health of the City of Chicago, Dr. Robert A. Black, Health Commissioner and Acting President of Board of Health of the City of Chicago,
Defendants-Appellants,

as the same remains upon the files and records of the United States Circuit Court of Appeals for the Seventh Circuit.

In Testimony Whereof I hereunto subscribe my name and affix the seal of said United States Circuit Court of Appeals for the Seventh Circuit, at the City of Chicago, this 5th day of September, A. D. 1941.

Kenneth J. Carrick,
(Seal) *Clerk of the United States Circuit Court of Appeals for the Seventh Circuit.*

SUPREME COURT OF THE UNITED STATES

ORDER ALLOWING CERTIORARI—Filed November 24, 1941

The petition herein for a writ of certiorari to the United States Circuit Court of Appeals for the Seventh Circuit is granted.

And it is further ordered that the duly certified copy of the transcript of the proceedings below which accompanied the petition shall be treated as though filed in response to such writ.

IN THE

Supreme Court of the United States

OCTOBER TERM, A. D. 1941.

No.

CITY OF CHICAGO, a Municipal Corporation, BOARD OF HEALTH OF THE CITY OF CHICAGO, DR. ROBERT A. BLACK, Health Commissioner and Acting President of Board of Health of the City of Chicago,

Petitioners,

vs.

FIELDCREST DAIRIES, INC.,

Respondent.

PETITION FOR WRIT OF CERTIORARI.

To the Honorable, the Chief Justice and Associate Justices of the Supreme Court of the United States:

The petition of City of Chicago, a municipal corporation, Board of Health of the City of Chicago, Dr. Robert A. Black, Health Commissioner and Acting President of Board of Health of the City of Chicago, respectfully shows:

Statement of the Matter Involved.

The particular matter involved is a provision in the milk ordinance of the City of Chicago requiring milk to be

delivered in "standard milk bottles."* The Circuit Court of Appeals for the Seventh Circuit has held that this provision of the ordinance is void (R. 1794). A writ of certiorari is sought to review the holding.

The respondent, Fielderest Dairies, Inc. (plaintiff in the trial court), a Michigan corporation incorporated in 1937 (R. 844, 1609-12), filed suit on February 2, 1939 against the petitioners (defendants) in the United States District Court for the Northern District of Illinois, Eastern Division. The plaintiff had sought a permit from the defendant Board of Health to sell milk in "Pure-Pak" paper containers in Chicago; the permit had been denied. The complaint (R. 2-15) alleged that the plaintiff's containers are "sterile, sanitary, and made of non-absorbent material" and are "standard milk bottles" within the terms of the Chicago ordinance requiring milk to be delivered in "standard milk bottles." The action of the defendants in refusing the permit to sell milk in Pure-Pak containers in Chicago was alleged to be discriminatory and unreasonable, to deprive the plaintiff of the equal protection of the laws, and to deprive the plaintiff of its property without due process of law, all in violation of the federal and Illinois constitutions. The complaint prayed (R. 14-15) for (1) a declaratory judgment finding either that the ordinance does not prohibit the plaintiff from selling milk products in Pure-Pak containers or that, if it does, the ordinance is unreasonable and unconstitutional; and for (2) an injunction restraining the defendants from interfering with the plaintiff in selling milk products in Pure-Pak containers in the city. The defendants filed an answer (R. 16-22) which denied that the plaintiff's containers are standard milk

* The provision is contained in the third sentence of section 3094 of the ordinance: "Any milk or milk products sold in quantities of less than one gallon shall be delivered in standard milk bottles; . . ." (R. 108).

bottles, are non-absorbent or sterile, or are sanitary containers for the distribution of milk, and denied that the plaintiff is entitled to the relief sought. The case was referred to a master in chancery for hearing (R. 123).

While the case was being tried before the master, a new issue arose as to the power of the city to regulate the character of containers used for the distribution of milk within the city. Municipalities in Illinois had been given broad regulatory powers over the production, processing, and distribution of milk by certain provisions of the Illinois Cities and Villages Act of 1872 (Public Laws of Illinois, 1871-72, pp. 231-233, secs. 1, 50, 53, 66, 78), which have not been repealed (Ill. Rev. Stat. 1939, ch. 24, secs. 65, 65.49, 65.52, 65.65, and 65.77). On July 1, 1939 the so-called Milk Plant Pasteurization Act went into effect (Laws of Illinois, 1939, pp. 660-666; Ill. Rev. Stat. 1939, ch. 56½, secs. 115-134). By this 1939 statute the Illinois General Assembly imposes many sanitary regulations on the milk industry, including a requirement that single-service (i.e. paper) milk containers be made and transported in a sanitary manner, and authorizes the Director of the Department of Public Health to promulgate minimum requirements for interpretation and enforcement of the act. Section 19 of the act contains a saving clause reading as follows:

> "Nothing in this act shall impair or abridge the power of any city, village or incorporated town to regulate the handling, processing, labeling, sale or distribution of pasteurized milk, and pasteurized milk products, provided such regulation not permit any person to violate any of the provisions of this act." (Ill. Rev. Stat. 1939, ch. 56½, sec. 133.)

The plaintiff placed reliance on this statute in the presentation of the case to the master (see master's report, R. 1732).

The master heard many witnesses, who testified (R. 132-1396) about the manufacture of paper milk containers, their sanitary and insanitary characteristics, their use and regulation outside of Chicago, and the use of glass milk bottles in Chicago. Many exhibits were admitted in evidence (R. 1397-1708). The master filed a comprehensive report (R. 1710-36), recommending the denial of the relief sought. His conclusions were that paper milk containers are not "standard milk bottles" and are forbidden by the Chicago ordinance; that the saving clause in the Milk Plant Pasteurization Act of 1939 preserved the pre-existing home rule of municipalities on the subject of the regulation of milk; and that the ordinance is valid. On the question of the reasonableness of the ordinance the master discussed the evidence in detail (R. 1718-31), made specific findings of fact (R. 1734-35), and found from the testimony of the plaintiff's witnesses that the sanitary characteristics of paper milk containers are such that the Chicago City Council may reasonably have decided that their prohibition was necessary to protect the purity and wholesomeness of milk (R. 1734).

The trial court sustained objections (R. 1738-49) to the master's report and rendered a decree (R. 1759-61) in favor of the plaintiff. The decree contained a declaratory judgment that the plaintiff's paper milk containers are standard milk bottles. It also enjoined the defendants from interfering with the sale and delivery by the plaintiff of milk in the City of Chicago in the plaintiff's Pure-Pak containers. The opinion of the trial court (R. 1752-56), while devoted chiefly to the proposition that the plaintiff's paper milk containers are standard milk bottles and are not forbidden by the ordinance, also stated that under the 1939 statute (the Milk Plant Pasteurization Act) the City of Chicago was "without power to prohibit the use of

single-service containers if such containers conformed to the provisions of the statute." And the opinion stated that the ordinance would be void if it were construed to forbid the use of paper containers; by this the court meant, as indicated by its findings of fact (R. 1756-58), that the ordinance would be "unreasonable and discriminatory and without any reasonable basis" if it forbade the use of paper milk containers.

On appeal by the defendants to the Circuit Court of Appeals, the opinion (R. 1782-94) was written by Major, Circuit Judge, joined in by Sparks, Circuit Judge, with Lindley, District Judge, dissenting in part (R. 1795-96). The Circuit Court of Appeals held (opinion, R. 1784-88) that the trial court erred in holding that the ordinance permitted the use of paper milk containers and approved the master's conclusion that the plaintiff's paper containers are not "standard milk bottles." Judge Lindley did not dissent from this portion of the opinion.

The majority opinion stated (R. 1790-93) that the ordinance was void because contrary to the public policy of the State of Illinois as expressed in the Milk Plant Pasteurization Act of 1939. After pointing out that this statute permits the use of single-service containers and that the plaintiff had obtained a state certificate of approval of its pasteurization plant, the opinion said that the right thus conferred by the state was denied to it by the city ordinance. The opinion also said:

> ". . . the state, upon entering the field not only made provision for the sale and distribution of pasteurized milk but recognized, permitted and approved the use of such containers (single-service or paper milk containers), and the ordinance is squarely in conflict therewith." (R. 1793.)

As for the saving clause in the statute (sec. 19 quoted above), the majority opinion stated that it granted the city "the power to regulate paper containers . . . but we are unable to accept the theory that it has authority to outlaw that which the state has legalized." The majority opinion said also (R. 1794) that there was no occasion 'to discuss at length or decide" other questions about the validity of the ordinance. Nevertheless the opinion continued with a brief discussion of factors in the case that were said to rebut the presumption of the validity of the ordinance when attacked on constitutional grounds. The majority opinion concluded that the plaintiff was entitled (a) to a declaratory judgment that the ordinance was void in prohibiting the use of the plaintiff's paper containers and (b) to an injunction "restraining the defendants from prohibiting, but not from regulating, the use of such containers" (R. 1794).

In his dissenting opinion Judge Lindley (R. 1795-96) stated that the ordinance should be sustained, that he was unable to agree that the ordinance violated the public policy of the State of Illinois as expressed in the 1939 statute. He said that the language of the saving clause "was not meaningless or surplusage as announced in the majority opinion, but rather in the nature of a declaratory clause maintaining the existing status . . . to assure municipalities that their power to act in the premises was not taken away . . . ".

Pursuant to the majority opinion a judgment was entered by the Circuit Court of Appeals, reversing the cause and remanding it for the sole purpose of modifying the decree to conform with the views expressed in the opinion (R. 1797). This is the judgment sought to be reviewed. It requires modifications in the decree of the trial court

as follows; while the decree contained a declaratory judgment that the plaintiff's paper containers are standard milk bottles and are permitted by the Chicago ordinance, the modified declaration will be that the ordinance is invalid in prohibiting the use of the plaintiff's containers; and while the decree enjoined the defendants "from in any manner or by any means preventing or in anywise interfering" with the sale and delivery of milk by the plaintiff in its paper milk containers, the injunction ordered by the Circuit Court of Appeals will restrain the defendants from prohibiting, but not from regulating, the use of the plaintiff's containers.

Basis of the Jurisdiction of This Court.

(a) The jurisdiction of this court is invoked under section 240 of the Judicial Code as amended by the act of February 3, 1925 [28 U. S. C. 347, par. (a)]. The pertinent language of the section is as follows:

> "(a) In any case . . . in a circuit court of appeals, . . . it shall be competent for the Supreme Court of the United States . . . to require by certiorari, *either before or after a judgment or decree by such lower court,* that the cause be certified to the Supreme Court for determination by it, and with like effect, as if the cause had been brought there by unrestricted appeal." (Italics added.)

In a sense the judgment of the Circuit Court of Appeals sought to be reviewed may not be a final judgment, since it reversed and remanded the cause for the purpose of modifying the decree entered by the trial court to conform with the views expressed in the opinion. But the Circuit Court of Appeals made a final determination that the ordinance involved is invalid and the formal modification of the decree is all that remains to be done in the trial court.

This alone is enough to permit the Supreme Court to review the cause by writ of certiorari, particularly since the judgment need not be final in the technical sense. This is evident from the language of the section quoted above. And see *Fuller* v. *Otis Elevator Company*, 245 U. S. 489 (1917), where the fact that the judgment was not final was held to be no objection to the granting of the writ.

(b) The judgment of the Circuit Court of Appeals sought to be reviewed was entered on August 4, 1941 (R. 1797).

Questions Presented.

There are two questions presented. Both require the application of federal and state law.

(1) The Circuit Court of Appeals has held that the City of Chicago did not have power to enact the ordinance forbidding the use of paper milk containers. This holding involves the construction of grants of regulatory powers made by the Illinois state legislature to the City of Chicago. The state law aspect of this question is: did the Illinois Milk Pasteurization Act of 1939 withdraw from the City of Chicago the power to enact the ordinance granted to the city by the Illinois Cities and Villages Act of 1872? In holding the ordinance invalid the Circuit Court of Appeals was exercising the jurisdiction of a federal court to grant writs of injunction and to enter declaratory judgments in diversity of citizenship cases. There is thus a federal question presented: should the Circuit Court of Appeals have exercised this jurisdiction to deny the city the power to enact the ordinance and thus to interfere with a local, state matter?

(2) The complaint alleged (R. 11) that the ordinance deprived the plaintiff of the equal protection of the laws

and of its property without due process of law in violation of both the federal constitution (fourteenth amendment) and the Illinois constitution (sections 2 and 13 of article 2). The trial court found that the ordinance would be unreasonable and discriminatory if it forbade the use of paper milk containers. It was not necessary for the Circuit Court of Appeals to decide this constitutional question, since it held that the city had been deprived of the power to pass the ordinance. Nevertheless the majority opinion of the Circuit Court of Appeals sets forth a number of grounds for holding the ordinance unreasonable, indicating that the majority considered the ordinance unconstitutional (R. 1794). There is here a question of the propriety of a judicial pronouncement that a city regulation is invalid under the fourteenth amendment when there is evidence in the record showing that the ordinance was not unreasonable. If this court should decide that the city has power to forbid the use of paper milk containers, the decision of the constitutional question cannot be avoided. On this issue the specific question, under both the federal and Illinois constitutions, is whether or not the plaintiff has proved that the ordinance, in forbidding the use of paper milk containers, is so palpably unreasonable as to be arbitrary or capricious, so that the provision bears no reasonable relation to the protection of the public health.

Reasons for Allowance of the Writ.

(1) In holding that the ordinance is void because the 1939 state statute deprived the city of the power to forbid the use of paper milk containers, the Circuit Court of Appeals has decided an important question of local law in a way clearly in conflict with the local law.

The holding of the Circuit Court of Appeals did not follow the controlling statute. Before 1939 the city had power to forbid the use of paper milk containers. The power was granted to the city in the Illinois Cities and Villages Act of 1872 which the Illinois courts construed as giving Illinois cities broad regulatory powers over the milk industry [*Koy* v. *City of Chicago*, 263 Ill. 122, 130-1 (1914)]. This was not denied in the majority opinion. But a 1939 statute which regulates the use of paper milk containers was said in the opinion to have withdrawn some of the city's power, so that the ordinance forbidding the use of paper milk containers conflicts with what was held to be a state public policy expressed in the statute. The saving clause in the 1939 statute (section 19) provided expressly that nothing in the act should "impair or abridge" the power of any city. In holding that some of the city's power was withdrawn by reason of provisions in the statute, the Circuit Court of Appeals held that the statute did "impair or abridge" the power of cities. It thus failed to follow the plain and unambiguous language of the saving clause in the statute, as noted in the dissenting opinion, although the question of the city's power is determined by construing the statutory grant of power. The holding is thus in conflict with the controlling local law.

The Illinois courts have not construed the 1939 statute. Yet there is no Illinois case that, in construing a legislative grant of municipal power, disregards the plain language of the grant, as did the holding here. The most pertinent Illinois case is *City of Ottawa* v. *Brown*, 372 Ill. 468 (1939). The Illinois Supreme Court, in considering the effect on a city's power of state regulations of the oil industry, there gave a broad interpretation to a saving clause less emphatic than the one involved here. The hold-

ing of the Circuit Court of Appeals conflicts with the *City of Ottawa* case, which was not mentioned in the opinion.

The holding of the Circuit Court of Appeals also violates settled rules of statutory construction. The intention of the legislature was drawn from isolated provisions of the 1939 statute rather than from the entire act. And language of the statute (the saving clause) was considered surplusage, although it is possible to give it effect.

From the language of the saving clause and the holding in the *City of Ottawa* case, it is clear that the Illinois Supreme Court would not have decided, as did the Circuit Court of Appeals, that the 1939 statute withdrew the city's power under the 1872 statute to enact the ordinance. The question is a peculiarly local one, controlled even before the decision in *Erie R. Co.* v. *Tompkins*, 304 U. S. 64 (1938), by the decisions of the local state courts.

The holding of the Circuit Court of Appeals is particularly erroneous in that it interferes with a local, state matter. The Circuit Court of Appeals has taken it upon itself to decide where the line limiting municipal power should be drawn, even though the Illinois legislature has itself drawn the line. If there is a doubt as to where the legislature drew the line, the Illinois courts will have the last word on the question. In interfering with the enforcement of a state law by the extraordinary remedy of a federal writ of injunction, the holding of the Circuit Court of Appeals conflicts with the decisions of this court in *Hawks* v. *Hamill*, 288 U. S. 52 (1933), and in *Railroad Commission of Texas* v. *Pullman Company;* 312 U. S. 496 (1941). For similar reasons the Circuit Court of Appeals should have refused in its discretion to enter a declaratory judgment that the city had been deprived of its power to enact the ordinance. Thus, if there were any doubt about

the power of the city, the Circuit Court of Appeals should have refused to decide the question. But the power of the city to enact the ordinance is so clear from the controlling statute and decisions of the state that the Circuit Court of Appeals should have determined without difficulty that the city had the power.

This local question is of great importance. The ruling adverse to the defendants means that an ordinance enacted by a legislative body representing more than 3,500,000 people is invalid. But the effect of the ruling is even more far-reaching. The holding that the 1939 Illinois statute has abridged and impaired the regulatory powers of cities over the milk industry, although the saving clause in the statute expressly provides to the contrary, deprives *all cities and villages in Illinois* of effective regulatory powers over the milk industry. And in nullifying the saving clause the holding casts doubt on the powers of cities and villages in Illinois to regulate other local matters which the state has begun to regulate.

(2) The holding of the trial court and the dictum of the Circuit Court of Appeals that the ordinance is an unreasonable exercise of the police power conflict with a long line of decisions of this court. The primary purpose of the ordinance in forbidding the use of paper milk containers is the protection of public health. The master, before whom the witnesses testified in extensive hearings, described in detail the sanitary characteristics of paper milk containers (R. 1718-29) and made specific findings that the City Council may reasonably have based its decision on evidence tending to prove that there are health hazards in the use of paper milk containers (R. 1734-35). The majority opinion of the Circuit Court of Appeals admitted that the record discloses "some evidence" that the use of paper

milk containers presents a hazard to health (R. 1794). The wisdom and propriety of forbidding the use of paper milk containers are matters for the determination of the legislative body. The conclusions of the trial court and the Circuit Court of Appeals that the ordinance is unreasonable were based upon factors that are not controlling under the applicable principles of constitutional law.

Cases establishing that the ordinance was not unreasonable are discussed in the attached brief. We note here briefly that regulations of the milk industry have been upheld by this court [*Nebbia* v. *New York*, 291 U. S. 502 (1933); *Adams* v. *Milwaukee*, 228 U. S. 572 (1911)] as well as regulations of containers [*Pacific States Box and Basket Co.* v. *White*, 296 U. S. 176 (1935)]. There are similar holdings by the Illinois Supreme Court [*Koy* v. *City of Chicago*, 263 Ill. 122 (1914) and cases there cited].

It is submitted that these reasons, which are discussed in greater detail in the attached brief, call for the exercise of this court's power of review.

Prayer of Petition.

Wherefore the petitioners respectfully pray: that a writ of certiorari be issued out of and under the seal of this court commanding the United States Circuit Court of Appeals for the Seventh Circuit to certify and send to this court for its review and determination a complete transcript of the record in the case numbered on its docket as No. 7502 and entitled Fielderest Dairies, Inc., Plaintiff-Appellee, *vs.* City of Chicago, a municipal corporation, Board of Health of the City of Chicago, Dr. Robert A. Black, Health Commissioner and Acting President of Board of Health of the City of Chicago, Defendants-Appellants; that the judgment of the Circuit Court of Appeals may be

reversed by this court; and that the petitioners may have such other and further relief as seems just.

City of Chicago, a municipal corporation,
Board of Health of the City of Chicago,
Dr. Robert A. Black, Health Commissioner and Acting President of Board of Health of the City of Chicago,

Petitioners.

By BARNET HODES,
Corporation Counsel of the City of Chicago,
511 City Hall, Chicago, Illinois.
Attorney for Petitioners.

JAMES A. VELDE,
Assistant Corporation Counsel,
WALTER V. SCHAEFER,
Of Counsel.

IN THE

Supreme Court of the United States

OCTOBER TERM, A. D. 1941.

No.

CITY OF CHICAGO, a Municipal Corporation, BOARD OF HEALTH OF THE CITY OF CHICAGO, DR. ROBERT A. BLACK, Health Commissioner and Acting President of Board of Health of the City of Chicago,

Petitioners,

vs.

FIELDCREST DAIRIES, INC.,

Respondent.

BRIEF IN SUPPORT OF PETITION FOR WRIT OF CERTIORARI.

Index.

An index to this brief with table of authorities cited appears on the pages preceding the petition, *supra.*

Opinions of the courts below.

The majority and dissenting opinions of the Circuit Court of Appeals (R. 1782-1796) are reported in 122 F. 2d 132 (1941); the opinion of the District Court (R. 1752-1756) is reported in 35 F. Supp. 451 (1940).

Statement of jurisdiction.

A statement of the grounds on which the jurisdiction of this court is invoked appears in the petition, *supra*, pp. 7-8, under the heading, "Basis of Jurisdiction of This Court".

Statement of the case.

A statement of the case appears in the petition, *supra*, pp. 1-7 under the heading, "Statement of the Matter Involved".

Specification of errors.

(1) The Circuit Court of Appeals erred in holding the provision of the Chicago ordinance to be in conflict with the public policy of the State of Illinois.

(2) The Circuit Court of Appeals erred in directing the issuance of an injunction and declaratory judgment in favor of the plaintiff.

(3) The Circuit Court of Appeals erred in not reversing the finding of the trial court that the ordinance is unreasonable and unconstitutional if it forbids the use of paper milk containers.

(4) The Circuit Court of Appeals erred in not holding that the judgment of the trial court should be reversed and a decree entered in accordance with the findings in the master's report.

Summary of Argument.

I. The Illinois Milk Pasteurization Plant Act of 1939 did not deprive the city of power to pass the ordinance.

The Illinois Cities and Villages Act of 1872 as construed by the Illinois courts granted power to the city to forbid the use of paper milk containers. The power was not impaired by the Milk Pasteurization Plant Law of 1939. This is clear from an analysis of the language and a consideration of the purpose of the saving clause in the statute. The Circuit Court of Appeals' construction of the 1939 statute disregards the plain language of the saving clause and violates elementary rules of statutory construction. The Illinois Supreme Court would not have decided the case as did the Circuit Court of Appeals. The decision of the Circuit Court of Appeals cuts down the power of all cities and villages in Illinois to make effective sanitary regulations of the milk industry. This court should review and decide on the merits the question of the city's power.

II. The ordinance is not invalid on constitutional grounds.

(a) The principles governing the validity of the ordinance under the due process clauses of the federal and Illinois constitutions are well settled. Debatable questions as to the reasonableness of the ordinance are for the legislative body and not the courts to determine. The courts may declare health legislation invalid only if palpably arbitrary or capricious. Regulations of containers and many regulations of the milk industry have been sustained.

(b) Evidence in the record shows that to forbid the use of paper containers for delivering milk is not unreasonable. The master found that there were possible public

health hazards in the use of paper milk containers. The Circuit Court of Appeals admitted that there was evidence in the record that their use presents a hazard to health. The presumption of validity of the ordinance is as strong as when the ordinance was enacted. The use of paper milk containers elsewhere, their regulation by the State of Illinois and in the model ordinance of the United States Public Health Service, the use of paper containers for other purposes, and the proposal by the Chicago Board of Health that the City Council permit their use for delivering milk are factors that are immaterial both in fact and in law. The prohibition of the use of paper milk containers is not so unrelated to any possible danger to the public health as to be considered an arbitrary interference with property rights.

ARGUMENT.

I.

The Illinois Milk Pasteurization Plant Act of 1939 did not deprive the city of power to pass the ordinance.

A question of construction of Illinois statutes is presented. The Circuit Court of Appeals held the ordinance invalid on the ground that it is contrary to the public policy of the state as found in an Illinois statute, the so-called Milk Pasteurization Plant Law of 1939 (Laws of Illinois, 1939, pp. 660-666; Ill. Rev. Stat. 1939, ch. 56½, secs. 115-134). Illinois cities derive their powers from the state legislature and have only such powers as have been delegated to them by the legislature. *City of Chicago* v. *Murphy*, 313 Ill. 98, 101 (1924). Consequently the acts of the Illinois General Assembly must be looked to for the existence and extent of any power assumed to be exercised by a city.

There is no constitutional objection to regulation of the same subject by statute and by ordinance. In *City of Chicago* v. *Union Ice Cream Co.*, 252 Ill. 311 (1911), the court said (p. 314):

> ". . . The great weight of authority is to the effect that the legislature may confer police power upon a municipality *over subjects within the provisions of existing State laws*. An act may be a penal offense under the laws of the State, and further penalties, under proper legislative authority, may be imposed for its commission by municipal ordinances. The enforcement of one would not preclude the enforcement of the other. (Citing authorities.) Municipal corporations are bodies politic, vested with many political and legislative powers for local government and police regula-

tions, established to aid the government by the State. The necessity for their organization may be found in the density of the population and the conditions incidental thereto. *Because of this, the municipal government should have power to make further and more definite regulations than are usually provided by general legislation* and to enforce them by appropriate penalties." (Italics added.)

Power of Cities under the 1872 Act.

As originally enacted in 1872, article 5 of the Illinois Cities and Villages Act contained the following provisions:

"Section 1. The city council in cities, and the president and the board of trustees in villages, shall have the following powers:

"Section 50. To regulate the sale of meats, poultry, fish, butter, cheese, lard, vegetables, and all other provisions, and to provide for place and manner of selling the same.

"Section 53. To provide for and regulate the inspection of meats, poultry, fish, butter, cheese, lard, vegetables, cotton, tobacco, flour, meal and other provisions.

"Section 66. To regulate the police of the city or village and pass and enforce all necessary police ordinances.

"Section 78. To do all acts, make all regulations which may be necessary or expedient for the promotion of health or the suppression of disease." (Public Laws of Illinois, 1871-72, pp. 231-233.)

Except for minor amendments not material here, there have been no changes in these provisions. (Sections 65, 65.49, 65.52, 65.65 and 65.77, ch. 24, Ill. Rev. Stat. 1939.)

These provisions have been interpreted by the Illinois Supreme Court to grant cities very broad regulatory

powers over the milk industry. A leading case is *Koy* v. *City of Chicago*, 263 Ill. 122 (1914), where the court held valid an ordinance requiring the use of a certain apparatus for the recording of temperatures during the pasteurization of milk. The court said (p. 127) of the above-quoted sections of the Cities and Villages Act:

> "The regulation of the sale of milk and its products is essential to the preservation of the public health, and authority for its regulations is clearly given to the city council by paragraphs 50, 53, 66 and 78 of section 1 of article 5 of the Cities and Villages act. (Citing cases)

A more detailed statement of the power of the city under the statute was also made (pp. 130-131):

> "* * * There is no article of food in more general use than milk; none whose impurity or unwholesomeness may more quickly, more widely and more seriously affect the health of those who use it. The regulation of its sale is an imperative duty which has been universally recognized. This regulation in minute detail is essential, and extends from the health and keeping of the cows which produce the milk, through all the processes of transportation, preservation and delivery to the consumer. Not only may laws and ordinances require that milk offered for sale shall be pure, wholesome and free from the bacilli of any disease, but they may and do, in order to produce this result, prescribe the manner in which such purity, wholesomeness and freedom from disease shall be secured and made to appear. The cows may be required to be registered with a designated public authority; the dairies to be conducted and managed according to prescribed regulations, and, together with the dairy utensils, subjected to inspection; the receptacles in which milk is contained to be of prescribed character and capacity; the labels to be placed according to fixed regulations and to contain certain required information; the milk to be prepared in the manner, at the

> times and by the means directed and at all times to be subject to inspection. These may be drastic restrictions upon a private business, but experience and the increasing knowledge of the causes of disease and the agencies of its propagation have demonstrated the necessity of such restrictions to the preservation of the public health. The object of all such restrictions is the preservation of the public health, and as a means to that end the protection of the general public against dishonest vendors of milk. They all impose inconveniences and expense upon the dealers in milk, but they are not on that account unreasonable, unjust or oppressive. Legislatures and city councils, in the exercise of the police power, may prohibit all things hurtful to the health and safety of society even though the prohibition invade the right of liberty or property of an individual."

The power of Illinois cities to regulate every detail of the milk industry is here said to extend to requiring "the receptacles in which milk is contained to be of prescribed character and capacity." Before the *Koy* case the state Supreme Court in *City of Chicago* v. *Bowman Dairy Co.*, 234 Ill. 294 (1908), had held valid an ordinance requiring milk bottles to contain a permanent indication of their capacity.

These broad regulatory powers over the milk industry were possessed by the City of Chicago when it passed a comprehensive milk ordinance on January 4, 1935 (R. 23-112). The ordinance contains regulations of many aspects of the production and distribution of milk. Included was the particular provision involved in this case:

> "Any milk or milk products sold in quantities of less than one gallon shall be delivered in standard milk bottles." (R. 108.)

This language required the use of the familiar glass milk containers. (So held the Circuit Court of Appeals in this

case, R. 1788, the construction of the ordinance being one of the issues litigated in the lower courts.)

The language of the *Koy* case that a city has power under the Cities and Villages Act to require a milk receptacle to be of prescribed character shows clearly that the City of Chicago had power to require milk to be delivered in standard milk bottles, even though the use of a receptacle that was not a standard milk bottle—such as a paper container—was prohibited. So also other devices of the dairy industry that did not meet the requirements of the ordinance were prohibited. Necessarily a regulation that prescribes a standard forbids what does not meet the standard. This was pointed out by the Illinois Supreme Court in *Haggenjos* v. *City of Chicago,* 336 Ill. 573 (1929), where an ordinance that prohibited parking automobiles on streets during certain hours of the day was attacked on the ground that the power to regulate the use of streets did not include the power to prohibit. Of the relative terms "regulate" and "prohibit" the Illinois Supreme Court said (pp. 576-577):

> "It has been said often that the power to regulate does not include the power to prohibit; and this is true in the sense that mere regulation is not the same as absolute prohibition. Regulation of business or action implies the continuance of such business or action, while prohibition implies its cessation. On the other hand, *the power to regulate implies the power to prohibit except upon the observation of authorized regulation.* The ordinance does not prohibit the standing of vehicles on all streets throughout the city or at all times, but only on some streets at some times." (Italics added)

The power to regulate the milk industry and milk containers thus included the power to require a prescribed container, and this power included in turn the power to forbid

the use of a container that did not meet the requirements imposed. Under the 1872 statute the City of Chicago thus had power to forbid the use of paper milk containers and to enact the ordinance so providing.

Effect of the 1939 statute on the power of cities.

The title of the Milk Pasteurization Plant Law of 1939 is as follows:

> "An Act regulating the handling, processing, labeling, sale and distribution of pasteurized milk and pasteurized milk products." (Laws of Illinois, 1939, p. 660; Ill. Rev. Stat. 1939, ch. 56½, sec. 115.)

Sections 1 to 18 of the act contain numerous regulatory provisions, including a requirement in section 15, item 10, that "single service containers . . . shall be manufactured and transported in a sanitary manner". Section 19 is a saving clause. It is the contention of the defendants that this saving clause retains intact the regulatory powers of the city that existed before the enactment of the statute. Section 19 reads as follows:

> "Nothing in this act shall impair or abridge the power of any city, village or incorporated town to regulate the handling, processing, labeling, sale or distribution of pasteurized milk and pasteurized milk products, provided that such regulation not permit any person to violate any of the provisions of this Act." (Ch. 56½, sec. 133, Ill. Rev. Stat. 1939.)

The meaning of this saving clause is the vital question on this branch of the case. The Circuit Court of Appeals holds that it did not prevent the impairment by the statute of some of the city's power. The defendants contend that its positive and unambiguous language has been disregarded by this holding.

It is not necessary to analyze the 1939 act in detail to see if it contains anything that is not covered by the terms of

the saving clause. The saving clause is in the language of the title of the act. The title describes the act as one regulating the "handling, processing, labeling, sale and distribution" of milk, and the saving clause states that nothing in the act shall impair the power of the city to regulate the "handling, processing, labeling, sale or distribution" of milk—the identical subjects named in the title. The Illinois constitution contains the common provision that an act may embrace only the subject expressed in the title (article 4, section 13, Illinois Constitution of 1870); and any subject in the act that is not embraced in the title is invalid. By using the language of the title in the clause that saves the power of cities and villages, the legislature thus necessarily saved to them their pre-existing power over the entire subject-matter covered by the act. The identity of the language in the saving clause with that in the title thus makes the saving clause as broad as it could possibly be made, so that, whatever aspects of the milk industry may be subjected to state-wide regulation by the statute, cities and villages retain to the fullest extent every power that they had theretofore. This identity of language alone indicates unmistakably that the saving clause preserved the city's power to forbid the use of paper milk containers. But the same result is reached by considering other aspects of the saving clause.

There is only one limitation in the saving clause on this complete retention of the power of cities: the proviso says that city regulation shall "not permit any person to violate any provisions" of the act. By expressing only one exception to the retention of power the legislature has indicated an intention that there is no other exception. This is a clear case for the application of the rule that the expression of one exception excludes other exceptions [see

People v. *Deep Rock Oil Corp.*, 343 Ill. 388, 401 (1931)]. The ordinance forbids the use of paper milk containers and does not permit a violation of the act. Not being within the exception, the power of the city has been retained.

Only a cursory reading of the saving clause indicates an intention not to make any change whatever in the powers of cities to regulate the sale of milk, including the power to forbid the use of paper milk containers. A detailed exposition of the language of the section leaves no possible doubt of this intention:

"*Nothing in this act . . .*". In spite of these self-explanatory words, the Circuit Court of Appeals finds *something* in the act that indicates a public policy affecting the powers of cities.

"*. . . shall impair or abridge . . .*". These words mean that the act was intended not to weaken or curtail the power which cities had before the act was passed. Yet the Circuit Court of Appeals holds squarely that the statute makes the city's power less than it was before.

"*. . . the power of any city, village or incorporated town . . .*". The power of cities to regulate milk was derived from the Illinois Cities and Villages Act of 1872 quoted above and interpreted by the Illinois Supreme Court in the *Koy* and other cases.

"*. . . to regulate . . .*". "To regulate" means "to control, govern, or direct by rule or regulation, to subject to guidance or restriction" (Oxford English Dictionary, *regulate*). "Regulate" was the very word used in the grant of power in the Illinois Cities and Villages Act of 1872 quoted above (cities were given power "to regulate the sale of . . . provisions", and to ". . . make all regulations which may be necessary or expedient for the promo-

tion of health or the suppression of diseases"). Under that act, as was stated in the *Koy* case, the power to regulate the milk industry included the power to prescribe the character of the receptacle in which milk is sold; and the power to regulate containers included the power to forbid the use of paper containers. The use of the same word "regulate" in the saving clause in the 1939 statute evidences an unmistakable legislative intention that cities may continue to forbid the use of paper containers.

". . . *the handling, processing, labeling, sale and distribution of pasteurized milk and pasteurized milk products*, . . .". As we have noted, these words describe the field of regulation described in the title of the act. Clearly the words "sale and distribution" include the type of container in which the product is sold or distributed.

". . . *provided such regulation not permit any person to violate any of the provisions of this act.*" As we have noted, this single limitation on the power of cities retained by the act indicates an intention that there are no other exceptions. A regulation that forbids the use of particular containers does not permit a violation of any state regulation. This would only be true of a regulation that permitted a type of container forbidden by the statute. The legislature's reason for inserting this proviso in the saving clause is apparent: the other language in the saving clause is so broad that, without the proviso, a city regulation might be valid even though it permitted a violation of the statute.

The purpose of the saving clause is clear. Within the confines of the State of Illinois are many urban and rural areas. Many municipalities are so small that their officers are unable to adopt and enforce adequate regulations of the milk industry. There may be a need for state regula-

tion of the milk industry in these small municipalities as well as in rural areas. Entirely different are the problems of regulation in a municipality like the City of Chicago, where the daily consumption of milk is about 1,300,000 quarts (R. 966) and there are about 140 dairies (R. 986). The necessity for municipal regulation that differs from state regulation is clearly recognized in *City of Chicago* v. *Union Ice Cream Co.*, 252 Ill. 311, 314 (1911), quoted above (pp. 19-20). It was this necessity that the legislature had in mind in stating in plain and unambiguous language that the power of cities and villages should remain intact.

The Circuit Court of Appeals' construction of the 1939 statute.

While the saving clause says that the 1939 statute shall not impair or abridge the city's power, the Circuit Court of Appeals holds that the city's power is less than it was before the statute was passed. The majority opinion of the Circuit Court of Appeals thus disregards the plain language of the statute. This was the view of the dissenting judge, who is his opinion said that the saving clause "was not meaningless or surplusage, as announced in the majority opinion" but was "in the nature of a declaratory clause maintaining the existing status, inserted by the legislature in an abundance of caution, to assure municipalities that their power to act in the premises was not taken away" (R. 1795). It is significant that the majority opinion does not even mention article 5 of the Illinois Cities and Villages Act of 1872 which, as quoted above, granted the City of Chicago broad regulatory powers over the milk industry.

From the fact that the statute and the regulations of the state Department of Health contain a few regulations

of paper containers (such as the provision in item 10 of section 15 that "single service containers . . . shall be manufactured and transported in a sanitary manner"), the majority opinion concludes that "the use of single service containers such as used by the plaintiff for the distribution of milk is permitted and approved upon compliance with the Act" (R. 1791). The opinion stresses the fact that the plaintiff has complied with the state requirements and has been issued a certificate of approval:

> "By this token it (the plaintiff) has been authorized by the state to sell and distribute its product within the confines of Illinois in single service containers. The city of Chicago, however, by the prohibition contained in its ordinance, denies this right conferred by the State." (R. 1791-92.)

This conclusion fails to take into account the rule that in construing a statute the entire act must be considered. Any certificate of approval granted to the plaintiff was granted under the statute and, if the plaintiff may be said to have a "right conferred by the state" to use a container that merely meets state requirements, that right was derived from the statute. This very statute said that the power of cities to forbid the use of paper containers was not impaired. Certainly the "certificate of approval" and any right to use a particular container are effective only within the purview of the statute. As a result a certificate or right granted under the statute is subject to the municipal regulation which the statute expressly permits. When the entire act is considered, this is what the legislature said. The prohibition in the ordinance does not deny a right conferred by the statute when the statute itself says that the prohibition may be imposed.

The basic fallacy in the reasoning of the Circuit Court of Appeals is shown by following the steps by which the con-

clusion of invalidity was reached. The reasoning of the opinion is: the statute regulates paper containers and permits their use; in prohibiting the use of what the statute permits, the ordinance conflicts with the statute; the rule therefore applies that ordinances may not conflict with the state law; and the saving clause may not be construed to give the city "authority to outlaw that which the state has legalized". The opinion finds the conflict, not with the statute as a whole, but with isolated sections that mention paper containers. The court does not even refer to the saving clause in the statute until *after* it has determined that the ordinance violates a public policy found in another part of the statute.

In finding a public policy from only a part of the statute and in disregarding the saving clause, the majority opinion violates the familiar rule that in construing a writing the entire writing is to be considered. See *People* v. *Whealan*, 353 Ill. 500 (1933), at p. 506:

> "It is a fundamental rule of statutory construction that the intention of the lawmaker should be deduced from a view of the whole statute and of every material part of it." (Citing many cases.)

Another cardinal rule of construction is violated by the opinion in the disregarding of the language of the saving clause: words should not be held to be surplusage if they may possibly be given effect. In *Crozer* v. *People*, 206 Ill. 464 (1904), the rule was stated. (pp. 469-470)

> "It is a cardinal rule of construction that a statute should be so construed that, if it can be prevented, no clause, sentence or word shall be superfluous, void or insignificant, but that it shall be so construed, if possible, that every sentence and word shall be given its ordinary meaning and acceptation. (*Decker* v. *Hughes*, 68 Ill. 33; *Thompson* v. *Bulson*, 78 *id.* 277; *Perteet* v. *People*, 65 *id.* 230.) In the last case the following lan-

guage from Lord Coke is quoted: *'The good expositor makes every sentence have its operation; gives effect to every word; will not construe it so that anything shall be vain or superfluous, but so expressed that one part of the act may agree with the other and all may stand together.'* " (Italics added.)

In view of the language of the saying clause, the opinion finds in the statute a declaration of public policy that is not there. This again violates a cardinal rule of statutory construction, stated in *Sup* v. *Cervenka,* 331 Ill. 459 (1928), where the Illinois Supreme Court said (pp. 461-462):

> "It is an elementary rule in the construction of a statute that the intention of the legislature must primarily be determined from the language of the statute itself and not from conjecture *aliunde.* When that language is plain and unambiguous and conveys a clear and definite meaning there is neither necessity nor authority for resorting to statutory construction. *If the words of a statute are plain and the legislative purpose manifest, that purpose must be given effect. The courts have no legislative powers,* and in the interpretation and construction of statutes *their sole function is to determine,* and within the constitutional limits of the legislative power to give effect to, *the intention of the legislature.* They cannot read into a statute something that is not within the manifest intention of the law-making body as gathered from the statute itself. To depart from the meaning expressed by the words is to alter a statute—it is to legislate and not to interpret. . . ." (Italics added)

It is difficult to understand why the Circuit Court of Appeals went as far as it did in disregarding the language of the saving clause. The opinion says that, if the saving clause was given effect, "it would make the state subservient to the city". The effect of the opinion is that it is beyond the power of a state legislature to prescribe minimum standards to be observed throughout the state and at the same time to authorize municipalities to fix

more stringent standards if they consider it necessary to do so. If, in such a situation, the state could be said to be "subservient", it has voluntarily assumed that status and has the power to change it when it sees fit. If the state legislature sees nothing incongruous in such a relationship with its municipalities, the mere fact that it may not coincide with the court's conception of the proper symmetrical organization of government is immaterial. Furthermore, the state is not subservient to the city if the state permits what the city forbids; each is merely regulating in its own sphere to meet its own particular needs. There is no rule of law that, regardless of the scope of the statutory grant of authority, the municipality may not forbid what the state permits. There is, of course, a rule that when a statute and an ordinance conflict or when an ordinance is contrary to a public policy stated in a statute, the statute controls.* But this rule applies only when the contrary intention of the legislature is not revealed by the express language of the statute. The rule has no application when the intention of the legislature is expressed in clear language as in the saving clause of the Milk Pasteurization Plant Law of 1939. Nevertheless, this seems to be the rule applied by the two majority judges of the Circuit Court of Appeals.

The Circuit Court of Appeals does not mention the most pertinent Illinois case construing legislative grants of municipal power: *City of Ottawa* v. *Brown*, 372 Ill. 468 (1939). It is the most pertinent case because the statute construed contained a saving clause.

The *City of Ottawa* case involved a 1930 ordinance that

* This rule has been applied in a number of Illinois cases, some of which are cited in the opinion of the Circuit Court of Appeals. *Village of Atwood* v. *Cincinnati, etc. R. Co.*, 316 Ill. 425 (1925); *City of Marengo* v. *Rowland*, 263 Ill. 531, 534 (1914); *City of Chicago* v. *Union Ice Cream Mfg. Co.*, 252 Ill. 311, 315 (1911); *City of Chicago* v. *Drogasawacz*, 256 Ill. 34, 37 (1912).

contained detailed regulations of gasoline filling stations; the defendant was accused of erecting a filling station without frontage consents as required by the ordinance. An Illinois statute of 1919 regulated "the storage, transportation, sale and use of gasoline" and authorized the state Department of Trade and Commerce to adopt regulations "except in cities or villages where regulatory ordinances upon the subject are in full force and effect." The question in the case was whether or not the saving clause was operative, in view of the provisions of the Cities and Villages Act of 1872* authorizing cities "to regulate and prevent storage . . . of petroleum" and an ordinance of 1916 regulating only the storage of gasoline and not undertaking to regulate filling stations. The court held that by virtue of the 1916 ordinance the city had sufficiently exercised its powers under the 1872 statute to enable it either to amend the 1916 ordinance *or to adopt a broader one;* and that consequently the 1930 ordinance was authorized and valid.

This *City of Ottawa* case presents a great contrast to the holding of the Circuit Court of Appeals. The Illinois Supreme Court held there that the 1919 saving clause, which was less extensive than the one here, preserved the pre-existing powers of the city granted in the 1872 act. The Illinois Supreme Court did not disregard the saving clause but interpreted it broadly and gave full effect to it. Here the Circuit Court of Appeals has not only failed to consider the 1872 act, but has disregarded the language of the 1939 saving clause. It has also disregarded this recent decision by the Illinois Supreme Court showing how

---

* This is the very statute involved in the case at bar, article 5 of the Cities and Villages Act of 1872 (Public Laws of Illinois, 1871-72, pp. 231-233). Article 5 contains broad grants of powers to cities and villages. While the *City of Ottawa* case involved section 65 of article 5, the instant case involves sections 50, 53, 66, and 78.

the state courts construe legislative grants of municipal power. Undoubtedly the Illinois Supreme Court would not have decided the case at bar as has the Circuit Court of Appeals.

It is true that the majority opinion of the Circuit Court of Appeals attempts to give the saving clause some vitality by saying:

> "The courts of Illinois have frequently recognized that power exercised by municipalities may be conferred or withdrawn by implication (citing cases). It therefore appears reasonable that the sole purpose of the saving clause was to prevent a construction by implication, withdrawing the vast authority which the city had theretofore had over the milk industry. . . . The purpose of the saving clause, in our judgment, was to preserve in the city the unquestioned right to continue in a field which had been entered by the state, and in which, thereafter, each should have co-extensive power and authority." (R. 1792-93.)

If the city and the state have "co-extensive power and authority," it would seem that the city has power to forbid the use of paper milk containers; the state clearly has the power even though it has not been exercised. The court's own statement of the purpose of the saving clause is thus inconsistent with its holding that the city regulation is invalid.

This self-contradiction is inevitable, for the language of the opinion cannot conceal the fact that the holding nullifies the saving clause. If there is a need for both city and state regulations, as evidenced by the saving clause, there are bound to be differences between them. Any city regulation that goes further than the minimum state regulations forbids what the state regulations permit. Under the holding of the Circuit Court of Appeals, all that remains of the city's power to protect its citizens from a

contaminated milk supply is the empty authority to make regulations that coincide exactly with state regulations. It seems clear that this holding invalidates other provisions of the milk ordinances of Illinois municipalities. For example, section 7 of the 1939 statute contains labeling provisions, requiring milk containers to be marked with the name of the contents, with the word "pasteurized" if the contents are pasteurized, and with the name and the post office address of the pasteurization plant. The labeling provisions in the Chicago ordinance (sec. 3090, R. 37-38) are much more extensive, requiring (among other things) that the date on which the milk is to be sold shall be marked on the container, a regulation designed to insure that too great an interval of time does not elapse between pasteurization and the sale to the consumer. The statute permits the use of undated containers and approves their use; while the ordinance prohibits the use of undated containers. If the holding of the Circuit Court of Appeals stands, the city requirement is invalid because it conflicts with the "public policy" of the state as expressed in the statute.

The effect of the decision of the Circuit Court of Appeals is far-reaching. Not only the City of Chicago but every city and village in Illinois are deprived of power to make effective local regulations of the milk industry. And the decision goes further. The boundary between the fields of state and local regulations may not be clearly defined. The decision of the Circuit Court of Appeals in effect takes away from the state legislature the power to fix the boundary and the court, in the exercise of its function to construe statutes, assumes the power itself. In fixing the boundary where it did, the Circuit Court of Appeals has affected adversely the regulatory powers of Illinois cities

and villages over other subjects that the state has begun to regulate.

There are thus important reasons why this court should review and reverse the judgment of the Circuit Court of Appeals.

* * * * * * *

The defendants urge this court to review and decide on the merits the local question of the city's power.

The defendants do not ask the court to review and reverse the case on the ground that, since the question of the power of the city to enact the ordinance is a local one to be decided by the state courts alone, the Circuit Court of Appeals should have refused to decide it. The position of the defendants on this aspect of the case requires an explanation.

It may be that the granting of the injunction and the declaratory judgment constitutes an unjustified interference by a federal court with local, state matters. The 1939 state statute, which is held to deprive the city of power to require the use of a particular kind of milk container, has not been construed by the state courts. More than a narrow controversy between two litigants is involved. The problem is one of public law—the construction of a legislative grant of municipal power—which affects all municipalities in Illinois. In this situation the Circuit Court of Appeals should perhaps have been reluctant to interfere by employing the extraordinary remedy of a federal writ of injunction. *Hawks* v. *Hamill*, 288 U. S. 52 (1933); *Railroad Commission of Texas* v. *Pullman Co.*, 312 U. S. 496 (1941). Similarly it would seem that a federal court should perhaps have exercised its discretion to refuse to enter a declaratory judgment. The Federal Declaratory Judgment Act (Act of June 14, 1934, 48 Stat. 955, 28 U. S. C., Sec.

400) gives federal courts discretion to grant or withhold the declaratory relief sought. This was noted in *American Automobile Insurance Company* v. *Freundt*, 103 F. 2d 613 (C. C. A. 7th, 1939) where the court said (p. 619):

> "It is clear from the report of the Senate Judiciary Committee that the Committee understood that under the proposed Act the district courts would enjoy a measure of discretion in the matter of granting or withholding declaratory relief."

In *Borchard on Declaratory Judgments* (1934) one of the grounds for withholding declaratory relief was stated as follows (p. 111):

> "The declaration will be refused where in the court's opinion it is inexpedient for some reason outside the record, such as public policy, or where the question might be raised again in some other way or where it would be embarrassing in the operations of government."

Nevertheless the defendants do not ask this court to rule merely that the Circuit Court of Appeals should not have decided the question of the power of the city to enact the ordinance. To remand the cause to the District Court with directions to retain it pending the determination of the state issue in the state courts, as was done in the *Pullman Company* case, would bring much inconvenience to the litigants. While the lower courts should perhaps have refused to consider the question at all, their rulings adverse to the city have clouded the powers of Illinois municipalities. Only by obtaining from this court a decision that the city has power to enact the ordinance may the city be restored to the position it had before the decision by the Circuit Court of Appeals. The suit was begun more than two and a half years ago and has gone through the lengthy process of extensive master's hearings, hearings

in the trial court on objections to the master's report, an appeal to the Circuit Court of Appeals, and now a petition for certiorari to this court.* The question of the city's power—unlike the local questions in the *Hawks* and *Pullman Company* cases—is free from difficulty. If the cause were remanded to await a determination of the question by the highest state court, the far-reaching effects of the action of the Circuit Court of Appeals in cutting down the powers of Illinois municipalities will remain operative for many months to come. The damage done should be remedied as soon as possible.

For these reasons the defendants urge this court to decide the question of the power of the city to enact the ordinance under the 1872 and 1939 state statutes.

II.

The ordinance is not invalid on constitutional grounds.

The validity of the ordinance under the federal and Illinois constitutions was questioned in the complaint. It alleged (R. 11) that the ordinance deprives the plaintiff

---

* In connection with the duration of the litigation, it is important to realize that the defendants have been unable to take advantage of the provisions of section 266 of the Judicial Code (28 U. S. C. 380) for the speedy determination of constitutional questions in the trial court and on appeal. This is the familiar provision that an application for an injunction to restrain state officers in the enforcement of a statute on the ground of its unconstitutionality shall be heard and determined by three judges and that a direct appeal may be taken to this court from the decree granting or denying the injunction. In this case the plaintiff sought an injunction on the ground that the ordinance was unconstitutional, the trial court so found, and the trial court entered the injunction prayed. Since the question is the constitutionality of an ordinance rather than the constitutionality of a statute, defendants have been unable to have the matter determined by a three-judge trial court or to appeal directly to this court. There have been a number of decisions to the effect that section 266 of the Judicial Code does not apply to ordinances. *Cumberland Telephone & Telegraph Co.* v. *City of Memphis*, 198 F. 955 (D. C. Tenn. 1912); *City of Baton Rouge* v. *Baton Rouge Waterworks Co.*, 30 F. 2d 895 (C. C. A. 5th, 1929).

of the equal protection of the laws and of its property without due process of law in violation of the fourteenth amendment to the federal constitution and article 2, section 2 (a due process clause similar to the fourteenth amendment clause) of the Illinois constitution. Most of the evidence heard by the master dealt with the reasonableness of the ordinance as an exercise of the police power. The trial court found, contrary to the master's findings (R. 1734), that the ordinance was unconstitutional (R. 1757). The majority opinion of the Circuit Court of Appeals states (R. 1794) that it does not "discuss at length or decide" this question. However, the opinion continues with a brief discussion of the question that indicates that the two majority judges considered the ordinance unconstitutional. The presumption that the ordinance is valid is said to be "little more than a shadow" because, when the ordinance was passed, the use of paper containers was in its incipient stage. And the evidence in the record that the use of such containers presents a hazard to health is said to carry "little, if any, conviction" in view of other factors—chiefly the fact that the containers are permitted elsewhere.

We discuss as one question (as did the lower courts) the reasonableness of the ordinance under the due process clauses of the federal and Illinois constitutions, although one clause presents a question of federal law and the other a question of state law; as shown by the cases cited below, the same principles govern each clause.

In casting doubt on the constitutional validity of the ordinance, the Circuit Court of Appeals has committed the error of substituting its judgment for the judgment of the Chicago City Council as to the need for the ordinance. Even though only a dictum, this judicial pronouncement of

the unreasonableness of the ordinance is an interference with legislative discretion in view of the evidence in the record. And the constitutional question must be decided if this court holds that the city had power to pass the ordinance. For these reasons the law as to the validity of legislation enacted under the police power and the evidence about the possible public health hazards in the use of paper milk containers must be considered.

(a) Principles governing the validity of the ordinance under the due process clause.

The rules for determining the reasonableness of legislation enacted under the police power have been announced in many opinions. We note a few illustrative cases that indicate the scope of judicial review. In *Standard Oil Company* v. *City of Marysville*, 279 U. S. 582 (1928), the court considered the validity of an ordinance which required that all tanks used for the storage of petroleum products be placed underground. Considerable evidence was heard about the relative safety of storage above and beneath the ground. Mr. Justice Stone delivered the opinion of the court and said (p. 584):

> "We need not labor the point, long settled, that where legislative action is within the scope of the police power, fairly debatable questions as to its reasonableness, wisdom and propriety are not for the determination of courts, but for that of the legislative body on which rest the duty and responsibility of decision." (Citing many cases.)

In *Laurel Hill Cemetery* v. *San Francisco*, 216 U. S. 358 (1910), the court considered the validity of an ordinance which prohibited the burial of the dead within the city and county limits. The ordinance was attacked on the ground that there was no hazard to public health in the main-

tenance of cemeteries within cities. The court in its opinion (by Mr. Justice Holmes) showed clearly its reluctance to substitute its judgment for that of the municipal legislative body. (p. 365):

> "But the propriety of deferring a good deal to the tribunals on the spot is not the only ground for caution. If every member of this bench clearly agreed that burying grounds were centers of safety, and thought the board of supervisors and the supreme court of California wholly wrong, it would not dispose of the case. There are other things to be considered. Opinion still may be divided, and if, on the hypothesis that the danger is real, the ordinance would be valid, we should not overthrow it merely because of our adherence to the other belief. Similar arguments were pressed upon this court with regard to vaccination, but they did not prevail. On the contrary, evidence that vaccination was deleterious was held properly to have been excluded." (Citing *Jacobson* v. *Massachusetts*, 197 U. S. 11 (1904), where the compulsory vaccination statute of Massachusetts was held valid.)

Schmidinger v. *Chicago*, 226 U. S. 578 (1912), involved the validity of an ordinance prescribing the weights for loaves of bread and prohibiting the sale of any loaves of bread which did not comply with the prescribed weights. Concerning the validity of this ordinance the court said (pp. 587-8):

> "* * * It is contended that the limitation of the right to sell bread which this ordinance undertakes to make in fixing a standard loaf * * * is such an unreasonable and arbitrary exercise of legislative power as to render it unconstitutional and void. This court has frequently affirmed that the local authorities intrusted with the regulation of such matters, and not the courts, are primarily the judges of the necessities of local situations calling for such legislation, and the courts may only interfere with laws or ordinances

> passed in pursuance of the police power where they are so arbitrary as to be palpably and unmistakably in excess of any reasonable exercise of the authority conferred." (Citing many cases.)

The presumption that the ordinance is valid is as strong on appeal as in the trial court. In *So. Carolina State Highway Dept.* v. *Barnwell Bros.*, 303 U. S. 177 (1936), a three-judge district court enjoined the enforcement of a statute forbidding the use on highways of trucks exceeding a prescribed width. In reversing the decision of the trial court, Mr. Justice Stone said at pp. 191-2:

> "Since the adoption of one weight or width regulation, rather than another, is a legislative not a judicial choice, *its constitutionality is not to be determined by weighing in the judicial scales the merits of the legislative choice and rejecting it if the weight of evidence presented in court appears to favor a different standard.* (Citing cases.) Being a legislative judgment it is presumed to be supported by facts known to the legislature unless facts judicially known or proved preclude that possibility. Hence, in reviewing the present determination *we examine the record; not to see whether the findings of the court below are supported by evidence, but to ascertain upon the whole record whether it is possible to say that the legislative choice is without rational basis.* (Citing cases.) Not only does the record fail to exclude that possibility, but it shows affirmatively that there is adequate support for the legislative judgment." (Italics added.)

The Illinois Supreme Court applies the same rules as the United States Supreme Court in considering the validity of legislation enacted under the police power. See *People* v. *Quality Provision Co.*, 367 Ill. 610 (1938), where the court noted that legislation will not be held unreasonable if the subject may be regarded as debatable (p. 614). See also *Gundling* v. *City of Chicago*, 176 Ill. 340 (1898);

City of Chicago v. *Bowman Dairy Co.*, 234 Ill. 294 (1908); *City of Chicago* v. *Arbucle*, 344 Ill. 597, 604-5 (1931).

These principles have recently been applied to uphold the regulation of containers in a case that seems controlling in the case at bar: *Pacific States Box & Basket Co.* v. *White*, 296 U. S. 176, 181-182 (1935). The regulation there held valid required that raspberries and strawberries be packed only in certain containers called "hallocks" of specified dimensions. One of the reasons ~~those~~ given by Mr. Justice Brandeis for holding the regulation not invalid was that "the character of the container may be an important factor in preserving the condition of raspberries and strawberries, which are not only perishable but tender." At page 182 Mr. Justice Brandeis said:

> "Different types of commodities require different types of containers; and as to each commodity there may be reasonable difference of opinion as to the type best adapted to the protection of the public. Whether it was necessary in Oregon to provide a standard container for raspberries and strawberries; and, if so, whether that adopted should have been made mandatory, involve questions of fact and of policy, the determination of which rests in the legislative branch of the state government. The determination may be made, if the constitution of the State permits, by a subordinate administrative body. With the wisdom of such a regulation we have, of course, no concern. We may enquire only whether it is arbitrary or capricious. That the requirement is not arbitrary or capricious seems clear. That the type of container prescribed by Oregon is an appropriate means for attaining permissible ends cannot be doubted."

A great variety of regulations of the milk industry have been sustained. In *Koy* v. *City of Chicago*, 263 Ill. 122, 130 (1914), the Illinois Supreme Court termed the regulation of the sale of milk "an imperative duty." *Nebbia* v. *New*

York, 291 U. S. 502 (1933), upheld a state law that authorized an administrative board to regulate the price of milk. (The opinion of Mr. Justice Roberts at pp. 521-530 contains a comprehensive review of cases involving police power regulations.) We cite other cases holding milk regulations valid as indicated:

Adams v. *Milwaukee*, 228 U. S. 572, 583 (1911), an ordinance prohibiting milk to be brought into the city unless it was produced by tuberculin tested cattle.

Commonwealth v. *Wheeler*, 205 Mass. 384, 91 N. E. 415 (1910), a statute fixing a minimum standard of butter fat content for milk and prohibiting the sale of substandard milk.

City of Milwaukee v. *Childs Co.*, 195 Wis. 148, 217 N. W. 703 (1928), an ordinance prohibiting the sale of milk except in the original containers.

Pacific Coast Dairy v. *Police Court*, 214 Cal. 668, 8 Pac. 2d 140 (1932), a statute imposing a penalty for not returning milk containers marked with the registered brand of the owners.

City of Chicago v. *Bowman Dairy Co.*, 234 Ill. 294 (1908), an ordinance requiring milk bottles to contain a permanent indication of their capacity.

(b) Evidence in the record shows that the prohibition of paper containers for delivering milk is not unreasonable.

There is no need to labor the obvious point that the regulation of the distribution of fresh milk is a vital necessity, particularly in a city the size of Chicago. The production and distribution of 1,300,000 quarts of an easily contaminated liquid daily consumed in Chicago obviously give rise to special problems of regulation. And a peculiar

importance is attached to milk regulations by the fact that milk is the staple item in the diet of infants.

The master heard much evidence on the question of the validity of the ordinance as a reasonable exercise of the police power. More than twenty witnesses testified for the plaintiff (R. 132-940, R. 1243-1306) and nine witnesses testified for the defendants (R. 942-1242). Approximately 120 exhibits were admitted in evidence (R. 1397-1708). There was admittedly testimony by some of the plaintiff's witnesses that the plaintiff's containers are sufficiently sanitary to permit their use for delivering milk. On the other hand, the testimony of the plaintiff's own witnesses revealed that paper containers have characteristics that create serious public health problems.

This is apparent from the master's report. After reciting the facts about the manufacture, processing, and filling of paper containers (R. 1718-22), the master found (R. 1723) that a legislative body might reasonably conclude that contamination might occur at one or more of the many stages from the pulp to the sealed container through carelessness, desire to save expense, inadequate facilities, or other reason. The master then discussed the evidence and made findings about the following matters: absorbency of paper containers (R. 1723-24), paraffin particles in the milk (R. 1724), odors from paraffin or bacteria (R. 1724-26), effective sanitary control of paper containers (R. 1726-29), non-transparency of paper containers and non-rising of cream to the top of containers (R. 1729-30). The master continued with the following general finding:

> "I find that there is evidence in the record, from plaintiff's own witnesses, independent of the corroborative testimony of Dr. Arnold, the City's witness, from which the City Council could reasonably have concluded that prohibition of paper containers was neces-

sary and appropriate to protect the purity and wholesomeness of milk, or, to state the proposition another way, it is at least doubtful whether plaintiff has proved that there is not sufficient evidence tending to establish a reasonable basis for such conclusion." (R. 1734).

The master then made specific findings of fact (R. 1734-35):

"I find, that the legislative body may reasonably have based its decision on evidence tending to prove the following:

"There are steps in the manufacture, conversion and filling of paper containers in which bacteria may get into the walls of the containers.

"Paper containers, even when paraffined, are to some extent absorbent and the milk may absorb such bacteria.

"Sanitary conditions differ from one paper mill to another and even in the same mill from time to time.

"The sanitary condition of the mill is a significant factor as to the condition of the finished container.

"The sanitary condition of the paper board blank determines the sanitary condition of the finished container.

"Particles of paraffin get into the milk and constitute a foreign substance which preferably should not be in milk, especially for babies.

"Odors from paraffin, whether the paraffin is fresh or not, may get into the milk.

"If the paper board contains a high amount of bacteria, there may exude objectionable odors which may get into the milk.

"The control and precautions by paper manufacturers themselves may not be adequate.

"In the case of glass milk bottles, the City has the cleaning process at hand locally and can exercise complete control; in the case of paper containers, inspection at remote places may be necessary but impractical or too expensive.

"Some paper containers have been shown to contain high bacterial counts.

"Paper containers are not transparent as glass bottles, so that it is difficult to observe the quality of the

milk or whether the milk contains dirt or other foreign body.

"Cream does not rise to the top in paper containers, so that purchasers may not readily know whether they are getting milk of the required fat content.

"The United States Public Health Service Sanitation Board in June 1939 criticized paper containers on account of their absorbency and the sloughing off of paraffin."

The master concluded that the court must hold the ordinance valid and the prohibition of paper containers reasonable, and recommended that the court should not issue the injunction or render the declaratory judgment requested. (R. 1735-36.)

The majority opinion of the Circuit Court of Appeals said of the evidence about the reasonableness of the ordinance: *"It is true the record discloses some evidence in support of defendants' contention that the use of such containers presents a hazard to health"* (R. 1794). Without more this evidence would seem to be enough, under the applicable principles of law discussed above, to show that a court would be interfering with the legislative discretion of the Chicago City Council in holding that the ordinance was unreasonable in forbidding the use of paper milk containers. This was the view of the dissenting judge who stated:

"The master found upon substantial evidence a number of facts bearing upon the undesirability of the use of paper milk bottles, showing clearly that at least the question of desirability of their use is debatable. In such case the city council is entitled to exercise its own administrative and legislative judgment,—a judgment not to be superseded by verdict of a jury or decision of a court." (Citing cases.) (R. 1796.)

But the majority opinion of the Circuit Court of Appeals and the opinion of the trial court both indicated that their

authors believed that other factors in the case outweighed the evidence showing possible health hazards in the use of paper milk containers. We turn to a discussion of these other factors to show that they are not controlling here.

Presumption of validity of ordinance.

The cases cited above show in clear language that whoever attacks the validity of legislation has the burden of establishing its validity and that there is a strong presumption that legislation enacted under the police power is valid. The majority opinion of the Circuit Court of Appeals says that here the presumption "could be little more than a shadow" since the use of paper milk containers was in its incipient stage when the ordinance was enacted in 1935 so that the legislative body "could not, from the nature of things, have considered and weighed their advantages and disadvantages" (R. 1794). We submit that this ruling is not sound constitutional law.

The defendants have never taken the position in this case that the reasonableness of the ordinance must be determined as of the time of its passage in 1935, for it is admitted that a law valid when passed may become invalid thereafter by reason of a change of conditions. This is pointed out in the opinion of the Circuit Court of Appeals (R. 1789). But certainly this does not mean that there is no presumption of the validity of legislation that is attacked on the ground that it became unreasonable after its enactment. Since the question of reasonableness is determined in the light of conditions existing today, we are not concerned here with what the City Council actually did consider before it enacted the ordinance, but with what it might reasonably have considered assuming conditions to have been as they are today or, rather, with what it

might reasonably consider today in the light of today's conditions. For this reason the presumption of validity is just as strong as if the ordinance had been passed today or as if today's conditions existed when the ordinance was passed.

The holding of the Circuit Court of Appeals would give courts a much greater latitude in invalidating legislation which affects conditions that come into existence after its enactment. The presumption of validity arises upon the enactment of the legislation. Obviously the strength of the presumption is not impaired by advancing age.

Use of paper milk containers elsewhere.

There is much evidence in the record about the use of paper containers for distributing milk in municipalities other than Chicago. The trial judge in his opinion placed much reliance on this evidence, as well as on the absence of evidence tracing "serious disease or minor ailment" to the use of paper containers (R. 1753). Likewise the majority opinion of the Circuit Court of Appeals emphasized that the use of paper containers "has been authorized and permitted by more than 200 cities and villages in the United States, including such cities as Washington, D. C., New York and Philadelphia, as well as practically all of the cities and villages near and adjacent to the City of Chicago" (R. 1794).

These factors have no bearing on the validity of the Chicago ordinance under the cases cited above. At the hearing before the master the defendants objected (R. 148) to the introduction of evidence of the use of paper milk containers in other municipalities if this evidence was to be considered on the question of the reasonableness

of the ordinance. Obviously the use of the containers elsewhere has no factual bearing on the case unless accompanied by evidence that municipalities not prohibiting them considered carefully the public health hazards involved. As shown below, the slight evidence in the record about the precautions taken in a few municipalities shows that the precautions were very inadequate.

The question of the reasonableness of the ordinance must be determined by the evidence about the sanitary qualities of the paper container and not by a roll call that arrays on one side the municipalities not prohibiting its use and on the other side the municipalities prohibiting its use. Obviously evidence of permission in one municipality or state cannot affect the validity of a prohibition in another municipality or state. The fact, for example, that Chicago may permit automobiles bearing loud speakers to tour the streets would afford no basis for an attack upon an ordinance of New York City prohibiting the use of those devices in congested areas. So the fact that other states did not limit the weight of motor trucks using their highways would not affect the validity of the Texas statute prescribing limitations of weight, *Sproles* v. *Binford*, 286 U. S. 374 (1931). The fact that Illinois has not seen fit to require compulsory vaccination could not affect the validity of a Massachusetts statute requiring compulsory vaccination, *Jacobson* v. *Massachusetts*, 197 U. S. 11 (1904). Oregon's regulations concerning fruit containers are not invalid because they prohibit the use of containers permitted elsewhere, *Pacific States Box and Basket Co.* v. *White*, 296 U. S. 176 (1935). Instances could readily be multiplied.

Also, the ordinance may not be held unreasonable because no instance of contagion or death resulting from the use of paper containers has been proved by the defendants.

The exercise of police power for the protection of the public health is not conditioned upon the prior occurrence of disease and death. A future hazard is as strong a justification for the exercise of the power as is a prior disaster. An antecedent outbreak of amoebic dysentery, for example, is not an essential condition to the exercise of the city's power to eliminate sources of danger in plumbing systems. So here, the city's power to protect itself from hazards to public health which it believes are inherent in the use of plaintiff's containers exists regardless of whether or not their use elsewhere has resulted in disaster. The plaintiff's witness, Packer, testified in his deposition that it was impossible to trace cases of contagion to a single service container (R. 1374-5). As a result the lack of evidence of specific cases of illness attributable to the use of these containers is in fact of no significance. See *Jacobson* v. *Massachusetts*, 197 U. S. 11 (1904), where the court rejected proof that vaccination was ineffective to prevent disease; and *Purity Extract Co.* v. *Lynch*, 226 U. S. 192 (1912), where a statute forbidding the sale of "malt liquors" was held to apply validly to a non-intoxicating malt liquor.

From the testimony of the plaintiff's witness, Packer, it is also apparent that the consumers of milk have been used in many municipalities as experimental media for the determination of the sanitary quality of paper containers. Packer testified in substance (R. 1368-9) that regulations governing the handling of paper containers are necessary; that no regulations exist in the City of Philadelphia, although regulations were being formulated at the time of the taking of his deposition. He further testified that regulations were as necessary in 1929 when the use of paper containers was first permitted in Philadelphia as they are now, but that regulations were not then formulated because

nobody knew what the regulations ought to be—"somebody had to pioneer" (R. 1370).

The principal witness for the plaintiff, Dr. John R. Sanborn, testified that in his opinion, in the interest of public health, standards should be formulated and adopted by public health authorities governing the production of paper board for use in paper milk containers and governing also the subsequent processing and handling of the paper board until the container is filled with milk. He further testified that he had attempted to ascertain what cities had adopted regulations with respect to paper containers and that so far as he knew no cities other than Baltimore, Maryland and Reading, Pennsylvania had adopted any regulations. In his opinion neither the Baltimore nor the Reading regulations were satisfactory (R. 244-7).

In this state of the record the fact that paper containers are used for the distribution of milk in some municipalities other than Chicago proves nothing with respect to the unreasonableness of prohibiting paper milk containers in Chicago.

Reliance upon experience elsewhere, as that of the trial judge and the Circuit Court of Appeals in this case, was rejected in *Standard Oil Company* v. *City of Marysville*, 279 U. S. 582 (1928), which involved an ordinance requiring the storage of gasoline below ground. The court said (p. 586):

> "The facts that the tanks of petitioners within the city limits have been operated successfully above ground; that appliances used by them are of the best type; that fires in connection with their many tanks located elsewhere have been relatively infrequent, and numerous others found by the master, were properly for the consideration of the city council in determining whether the ordinance should be enacted, but they fall far short of withdrawing the subject from legislative determination or establishing that the decision made was arbitrary or unreasonable. * * *

"We may not test in the balances of judicial review the weight and sufficiency of the facts to sustain the conclusion of the legislative body, nor may we set aside the ordinance because compliance with it is burdensome. * * *"

Regulation of paper milk containers by the State of Illinois.

Another factor noted by the majority opinion of the Circuit Court of Appeals is that "the legislature of the State of Illinois and its Department of Health have approved the use of such containers since 1939" (R. 1794). As we have pointed out in Point I of this brief, the State of Illinois in regulating paper milk containers provided expressly in the 1939 statute that cities could regulate further. Also, the recognition of the use of paper milk containers by the state is merely another instance of their use elsewhere. This factor, as we have just explained, is immaterial in fact and in law.

Regulation of paper milk containers in model ordinance of United States Public Health Service.

Another element emphasized by the majority opinion of the Circuit Court of Appeals is "the fact that the United States Public Health Service, whose model ordinance has been widely adopted by cities throughout the United States, including the City of Chicago, amended its ordinance in 1939, so as to include the regulation of single-service containers" (R. 1794).

We note briefly the facts involved. The United States Public Health Service, which performs advisory functions only as to municipal milk regulations (R. 609), has prepared a model ordinance and code of regulations, both of which the City of Chicago follows substantially (R. 1065). While this case was pending before the master, section 10 of the Health Service's model ordinance was amended

to provide that milk may be delivered in single-service containers (defendants' exhibit 17, R. 980, R. 1678-79). At the time when this amendment was made, the Health Service also added provisions to its model code of regulations providing for the regulation of single-service containers. Included in the regulations* recommended were the following:

> "(5) The manufacture, packing, transportation and handling of single-service containers and container caps and covers are conducted in accordance with the following requirements. *Inspections required herein may be made by the health officer or by any agency authorized* by him. * * *
>
> "(c) All operations at the fabrication plant and during transportation of the manufactured articles shall be so conducted as to reduce to a minimum the possibility of contaminating the manufactured articles, as prescribed in items 13p, 14p, and 15p" (R. 1590-1; italics added).

These regulations require public health officials to inspect the paper mills and converting or fabrication plants in which the various processes in the manufacture of paper milk containers take place. The regulations say that the inspections may be made "by the health officer or by any agency authorized by him". The paper mills and converting plants where paper containers are made are located in various parts of the country—e.g., at the time of the trial the paper in the plaintiff's container was made in the West Virginia mill of the Cherry River Paper Company (R. 164) and the paper was converted into the containers by another manufacturer at Middleton, Ohio (R. 198). The inspection of the manufacturing of the plaintiff's container would thus require Chicago health officials to travel to West Virginia

* The Model Code of Regulations of the United States Public Health Service also contained a statement about the characteristics of paper milk containers which shows that their prohibition is not unreasonable:

> "The porous condition of paraffined containers now available and the sloughing off of particles of paraffin into the product are undesirable, and manufacturers of single-service containers are urged to make every effort to provide a non-absorbent non-flaking surface" (plaintiff's exhibit 61, R. 1591).

and Ohio; and there are other types of containers for which the paper is made and fabricated in many other states (see map, R. 1479). Also there is no "agency authorized" by health officers to inspect paper mills and fabrication plants (Prucha, R. 1734).

In contrast with the expensive devices suggested by the regulations of the Health Service for the supervision of paper milk containers, the sanitary quality of the glass containers which the Chicago ordinance requires may be supervised locally. Since the glass container can be effectively sterilized at the dairy when it is being filled with milk (Sanborn, R. 169), there is no need to inspect any aspect of the glass container before the cleaning process at the dairy. Not only are glass containers absolutely sterile when manufactured (R. 169), they receive bactericidal treatment before each use and with the best method of sterilization it is possible to obtain a sterile glass bottle "according to bacteriological tests" (R. 170). The bactericidal treatment at the local dairy can be thoroughly inspected and controlled locally. In Chicago this control consists of regular inspections of the cleaning process, including the operation of the washing equipment, the temperatures of the solutions used, the bottling equipment, etc. (R. 970-72). Also occasional tests are made locally of the bacterial content of sample bottles (R. 972).

Instead of permitting the use of paper milk containers, the proper regulation of which requires inspection of manufacturing processes at far-distant places, the Chicago City Council requires the use of glass containers which may be (and are) inspected locally. This is not an unreasonable legislative determination, even though the model ordinance of the United States Public Health Service permits both glass and paper milk containers.

Use of paper containers for other purposes.

In holding that the ordinance was void if it forbade the use of paper milk containers, the trial judge placed great reliance on evidence about other uses of paper containers in Chicago (opinion, R. 1752). Of one type of container; the opinion states that it is less meritorious in structure and design than plaintiff's and is in daily use in Chicago for the sale of milk, chocolate milk, ice cream, and other liquids by drug stores, hotels, restaurants, and soda fountains.* The other type, the opinion says, is in common use for cheese, butter, meat, drinks, and other edibles.

The record shows that the use of paper containers for purposes other than the delivery of fresh milk does not make the prohibition of the use of paper milk containers unreasonable or discriminatory. The defendants introduced evidence showing that the characteristics of the other commodities sold in paper containers are such that from a public health point of view they are in nowise comparable to milk (R. 1094-95, R. 1171-73). This fact is also established in the record by the statement of the plaintiff's leading witness, Dr. John R. Sanborn:

> "... *milk is the most perishable and easily contaminated food that is placed in paper containers* ..." (R. 1495).

---

* The trial court did not point out that the sale in paper containers of such of these commodities as are milk products is forbidden by the Chicago Board of Health. The only evidence of the sale of milk in paper containers was testimony that attorneys employed by the plaintiff went to several drug stores and restaurants in Chicago and purchased milk in paper tumblers (R. 857-62, 891, 897). The clerks in these stores were violating a regulation of the Board of Health providing, "All milk and milk products shall be sold, served, or dispensed to the final consumer only in unopened, original containers as received from the distributor" (defendants' exhibit 26, R. 1697). Obviously a violation of this regulation does not show that there are no health hazards in the use of paper milk containers.

Proposal by Chicago Board of Health that City Council permit use of paper milk containers.

The majority opinion of the Circuit Court of Appeals emphasizes the fact that the Chicago Board of Health recommended to the Chicago City Council that the ordinance be changed in accordance with the amendment to the model ordinance of the United States Public Health Service. The proposal was made on October 16, 1939 while this case was being heard by the master. In making its recommendation for the change in the ordinance, the Chicago Board of Health also recommended that the regulations of the United States Public Health Service be adopted (R. 1698-99). As we have noted, the regulations of the Health Service require health officials to inspect paper milk containers while in the process of manufacture and this inspection must be made in far-distant places. Clearly it is not unreasonable on the part of the Chicago City Council to disregard the recommendation of the Board of Health that paper milk containers be permitted when the regulations of the containers recommended by the Board would require the local health officers to make expensive inspection trips to the paper mills and converting plants.

* * * * * *

We submit that the factors considered by the trial court and the majority of the judges of the Circuit Court of Appeals to prove the ordinance to be unreasonable are not determinative of the question of the validity of the ordinance under the fourteenth amendment. Unless the wisdom and propriety of the ordinance are to be determined by the courts, the controlling factor is what was admitted in the majority opinion of the Circuit Court of Appeals: "the record discloses some evidence . . . that the use of such

containers presents a hazard to health" (R. 1794). In view of the findings of the master and this admission by the Circuit Court of Appeals, we have not discussed in detail the evidence showing these hazards, but we call particular attention to the master's discussion of the evidence about the characteristics of paper milk containers (R. 1718-29).

The prohibition of the use of paper milk containers may be held unreasonable only if it is "so unrelated in any way to any possible danger to public health that the enactment must be considered as a merely arbitrary interference with the property and liberty of the citizens" [*People* v. *Quality Provision Co.*, 367 Ill. 610, 614 (1938), quoting from Mr. Justice Hughes in *Price* v. *Illinois*, 238 U. S. 446, 451-452 (1915)]. The evidence shows that the ordinance is not unreasonable. The holding of the trial court and the pronouncement of the Circuit Court of Appeals that the ordinance is unreasonable were based on an erroneous conception of the applicable principles of constitutional law.

CONCLUSION.

The defendants (petitioners) respectfully urge this court to review and reverse the judgment of the Circuit Court of Appeals.

CITY OF CHICAGO, *a Municipal Corporation,*

Supreme Court of the United States

OCTOBER TERM, A. D. 1941.

No. 706

CITY OF CHICAGO, a Municipal Corporation, BOARD OF HEALTH OF THE CITY OF CHICAGO, DR. ROBERT A. BLACK, Health Commissioner and Acting President of Board of Health of the City of Chicago,

Petitioners,

vs.

FIELDCREST DAIRIES, INC.,

Respondent.

REPLY BY PETITIONERS TO RESPONDENT'S BRIEF IN OPPOSITION TO PETITION FOR WRIT OF CERTIORARI.

Reply to Plaintiff's Preliminary Statement.

The plaintiff says (p. 5) that the decision by the Circuit Court of Appeals is "of local interest only and does not present a question of such importance as justifies the awarding of the writ of certiorari." It would seem that any decision by a federal court which cuts down the powers of a municipality as large as the City of Chicago to regulate the public health is extremely important; and, as noted in the defendants' original brief (pp. 35-36), this par-

ticular decision affects the regulatory powers of all Illinois municipalities.

The plaintiff says (p. 5): "No conflict with Illinois decisions is shown, and in fact none exists." This is not true. The decision conflicts not only with settled rules of statutory construction stated in Illinois decisions but with the holding in *City of Ottawa* v. *Brown*, 372 Ill. 468 (1939); see defendants' brief, pp. 30-33. It also conflicts with the plain language of the saving clause of the 1939 statute cited and discussed in the defendants' brief (pp. 24-28). There is not a single Illinois decision which supports the decision of the Circuit Court of Appeals; none of the cases relied on by the Circuit Court of Appeals or by the plaintiff in its brief contained a saving clause as did the 1939 statute involved here.

It is said (plaintiff's brief, p. 5) that if the opinion of the Circuit Court of Appeals was wrong in interpreting the statute, "the Illinois legislature can correct it." The defendants' contention is that the lower court has disregarded the plain language used by the Illinois legislature. In so doing it applied a rule of law that has no application here in view of the statutory language. The effect of the decision is thus to enunciate a new principle of the law of municipal corporations, the principle being that, no matter how extensive the legislative grant of municipal power may be, the municipality may not forbid what the state acting through the legislature does not forbid. It is difficult to see how the legislature could have been any more emphatic than when it said, "Nothing in this act shall impair or abridge the power" of cities to regulate the distribution of milk. The situation created by the Circuit Court of Appeals in disregarding this language is one that can be effectively corrected only by a court of review.

Reply to Plaintiff's Point I.

The plaintiff says (p. 7) that "the *defendants* submitted in the trial court and in the Circuit Court of Appeals the question" of whether or not the 1939 statute deprived the city of power to forbid the use of paper milk containers. It seems likely that the word "defendants" is used inadvertently for the word "plaintiff," although the record does not show clearly how the question was first raised. The plaintiff complains that the defendants now contend for the first time that the courts below should not have decided the question.

The question of the city's power under the 1939 statute was not raised in the complaint, for when the complaint was filed in February, 1939 the 1939 statute had not become effective. The only indication in the record about how the question was first raised is the statement in the master's report (R. 1732) that the "plaintiff refers" to the statute. The master disposed of the point with one sentence. Similarly the opinion of the trial court discussed the point in only one sentence (R. 1756). The findings of fact, the conclusions of law, and the decree of the trial court (R. 1756-1761) do not find or decide that the ordinance is in conflict with the 1939 statute, but merely say that the plaintiff's containers conform with the provisions of the statute. The Circuit Court of Appeals then based its decision against the defendants on a holding that the city's power was impaired by the 1939 statute, although the two majority judges also indicated that they considered the ordinance unconstitutional. The substantial questions raised by the pleadings in this case were the construction of the ordinance as including or excluding paper milk containers and the validity of the ordinance as a reasonable exercise

of the police power. The new issue as to the city's power under the 1939 statute emerged as a substantial question for the first time in the majority opinion of the Circuit Court of Appeals. For this reason the application of the rule announced in *Railroad Commission of Texas* v. *Pullman Company*, 312 U. S. 496 (1941), has not been urged before. Nevertheless the defendants urge this court to review and decide on the merits the local question of the city's power (see brief, pp. 36-38).

The plaintiff says (brief, pp. 7-9) that the *Pullman Company* case is "not authority in the present proceeding" because there the Texas statute provided for a statutory method of appeal from the administrative order attacked in the federal courts. The only importance of that factor in the case was that, unlike some administrative orders, the order was appealable under the state statute. So here, if the plaintiff had filed its suit in an Illinois state court of first instance and had been unsuccessful, it could have appealed to Illinois courts of review under section 74 of the Illinois Civil Practice Act (Ill. Rev. Stat. 1941, ch. 110, sec. 198). Moreover, the *Pullman Company* case is merely one of a number of decisions applying the principle stated in the opinion by Mr. Justice Frankfurter:

> "Few public interests have a higher claim upon the discretion of a federal chancellor than the avoidance of needless friction with state policies, whether the policy relates to the enforcement of the criminal law, . . . or the final authority of a state court to interpret doubtful regulatory laws of the state . . ."

This principle, clearly applicable here, was applied in *Hawks* v. *Hamill*, 288 U. S. 52 (1933), cited in the defendants' brief (pp. 36, 38) and not mentioned in the plaintiff's brief.

Reply to Plaintiff's Point II.

Outstanding is the fact that the plaintiff does not deny that the holding of the lower court means that the city's power under the 1939 statute is less than it was before. The holding means that the city's power *was* impaired by the statute, although the saving clause in section 19 of the statute says expressly, "*Nothing in this act shall impair or abridge the power of any city . . . to regulate . . . the . . . distribution of . . . milk . . .*". Moreover:

(a) The plaintiff does not deny that the broad power of the city to regulate the milk industry under the Cities and Villages Act of 1872 included the power to forbid the use of paper milk containers (see defendants' brief, pp. 20-24).

(b) The plaintiff does not discuss the meaning of the particular words in the saving clause. These words state emphatically and unmistakably that the power of the city under the 1939 statute is the same as it was under the 1872 statute (except for the inapplicable proviso). See defendants' brief, pp. 26-27.

(c) The plaintiff does not answer the defendants' contention (pp. 24-25) that, since the saving clause and the title of the statute are in identical terms, the saving clause is as broad as language could make it and, whatever aspect of the milk industry is regulated by the statute, the legislature has said expressly that the city retains its power to regulate.

(d) The plaintiff does not answer the defendants' contention (brief, pp. 25-26) that the proviso in the saving clause evidences a legislative intention that only matters within the proviso are excepted from the broad operation of the saving clause under the rule, *expressio unius est exclusio alterius*, and consequently the power to forbid the use of paper milk containers is retained.

(e) The plaintiff does not answer the defendants' contention (brief, pp. 29-30) that the Circuit Court of Appeals found that the ordinance conflicts, not with the entire statute, but with a part of it; and that the

court's reasoning was basically fallacious in considering the effect of a part of the statute on the city's power *before* it considered the meaning of the clause that preserves the city's power. In fact the plaintiff commits the same error: *before* considering the meaning of the saving clause (plaintiff's brief, pp. 31-41), the plaintiff (brief, pp. 13-31) argues and concludes that the ordinance conflicts with the statute. There is no conflict between the ordinance and the statute when the statute is considered as a whole.

The plaintiff (p. 13) attempts to discredit the pertinency here of *Koy* v. *City of Chicago*, 263 Ill. 122 (1914). The holding in that case, as that of the Circuit Court of Appeals here, had far-reaching effects in that it showed the extent (there held broad) of the power of cities to regulate the milk industry. The *Koy* case was so described by the Circuit Court of Appeals in its opinion (R. 1792), where it speaks of "the broad field of regulation which it (the city) had theretofore had as recognized in *Koy* v. *City of Chicago*, 263 Ill. 122."

Similarly *City of Ottawa* v. *Brown*, 372 Ill. 468 (1939), is of vital importance here as indicating the attitude of Illinois courts in construing legislative grants of municipal power. The plaintiff says that the opinion is completely devoid of language which "by any stretch of the imagination" could be construed to bear on the issues in the present case. There, as here, the City of Ottawa had a power to regulate under the 1872 Cities and Villages Act. There, as here, the state began to regulate. There, as here, the statute contained a saving clause. And there, as should have been held here, the Illinois Supreme Court held that the pre-existing power of the city was retained by the saving clause, although the same claims of conflict between city and state regulation could be made as are made here.

City of Rockford v. *Hey*, 366 Ill. 526 (1937), discussed at some length by the plaintiff (brief, pp. 14-15, 29-31), was neither relied on or cited by the Circuit Court of Appeals. It has no bearing here. The case held invalid an ordinance that required ice cream makers to pay a license fee to the City of Rockford for inspection of their factories *in other cities*. Here the plaintiff was not refused a permit to sell milk in Chicago because its plant outside of Chicago does not comply with Chicago regulations, but because the plaintiff seeks to sell milk in Chicago in a manner forbidden by the ordinance. Here the ordinance reads, ". . . milk sold in quantities of less than one gallon shall be delivered in standard milk bottles" and operates only within the city.

The plaintiff says that the constitutional question is not involved at this stage of the litigation and denies (brief, p. 15) that the opinion of the Circuit Court of Appeals contains a dictum that the ordinance is an unreasonable exercise of the police power. The discussion in the majority opinion (R. 1794) of a number of matters that relate only to the constitutionality of the ordinance clearly amounts to a dictum that the ordinance is an unreasonable exercise of the police power. These statements about such a delicate question as the validity of a health regulation under the fourteenth amendment constitute a precedent of far-reaching effect on the power of courts to invalidate health regulations under the fourteenth amendment and would alone seem to be a sufficient ground to require this court to exercise its power of review.

Moreover, the plaintiff makes many statements that can be addressed only to the question of the unreasonableness of the ordinance. The plaintiff speaks of the fitness of paper milk containers for the "prevention of disease" and of "their other benefits" (brief, p. 6) and argues that the

use of paper milk containers in Chicago since the entry of the injunction in the trial court indicates that they do not present a hazard to health (brief, pp. 6, 13; obviously this fact is not shown in the record). Also the plaintiff speaks of the "injustice" of permitting the city to forbid the use of paper containers, saying that "the *supposed* judgment of fifty aldermen" (italics are the plaintiff's) is aligned against the Chicago Board of Health, the Illinois General Assembly, the Director of the Illinois Department of Health, and the United States Public Health Service (plaintiff's brief, p. 43). For a complete answer to the plaintiff's statement, see the defendants' brief (pp. 49-57).

The plaintiff (pp. 22-28) cites many Illinois cases in which the rule was applied that an ordinance is invalid when it conflicts with a state statute or a public policy expressed in a state statute. This is a rule of statutory construction only, as is apparent from the cases cited. In not one of these cases did the statute involved contain an operative saving clause retaining unimpaired the powers of municipalities, as does section 19 of the 1939 Milk Pasteurization Act.

In view of the broad language of the saving clause it is immaterial whether the ordinance and the 1939 statute conflict. In fact, however, they do not conflict. The plaintiff discusses the statute at length (brief, pp. 17-21, 41-43) in an attempt to establish a conflict. The sections of the statute and the regulations of the Department of Health merely contain some provisions *about* paper milk containers. They do not say that paper milk containers must be permitted, but merely recognize and regulate their use. The plaintiff's statement (pp. 42-43) that the State of Illinois "makes it illegal" for the plaintiff to sell milk in any way but in paper containers is clearly wrong.

It may be that the plaintiff has no equipment to package milk in glass containers and that the state regulations would forbid the use of paper-container equipment for filling glass containers. But the state does not prevent the plaintiff from using other equipment to fill glass containers nor from selling milk in glass containers.

In discussing the rule that the statute controls where there is a conflict between a statute and an ordinance, the plaintiff, as did the Circuit Court of Appeals (R. 1791), quotes from 2 McQuillin on Municipal Corporations (2d Ed. 1928) 572, but does not quote the entire sentence. The word "established" at the end of the plaintiff's quotation (p. 25) is not followed by a period but by a comma and, after saying that an ordinance may not be contrary to a public policy expressed in legislation, the text continues with the following words:

> "unless there is a specific, positive, lawful grant of power by the state to the municipality to ordain otherwise, in which event the specific, positive, lawful grant is from the same source of authority that made and has been expressed through legislation the policy of the state."

This important clause not only shows that the problem is one of statutory construction, but applies expressly to the "specific, positive, lawful grant" of power to the city in the saving clause.

The plaintiff also quotes (p. 25) from 43 Corpus Juris 215-17, section 219, which states the general rule about conflicting ordinances and statutes. A more specific discussion in section 220 (pp. 218-220) shows that there is no conflict in the present case:

> "The rule that a municipal ordinance in conflict with a state law is void does not apply unless the state law with which the particular ordinance conflicts is

intended to apply, and is, in fact, applicable and imperative in the particular municipal corporation in which such ordinance has been enacted" (43 Corpus Juris 219).

"The fact that an ordinance enlarges upon the provisions of a statute by requiring more than the statute requires creates no conflict therewith, unless the statute limits the requirement for all cases to its own prescriptions" (43 Corpus Juris 219-220).

In several places, in discussing the saving clause, the plaintiff says that it means that the powers of the City of Chicago are unimpaired "except to the extent that the State by and pursuant to the 1939 milk act occupies the field of milk regulation" (brief, p. 33; see also p. 39). This statement conflicts even with the interpretation of the saving clause in the majority opinion of the Circuit Court of Appeals, which said:

"The purpose of the saving clause, in our judgment, was to preserve in the city the unquestioned right to continue *in a field which had been entered by the state, and in which, thereafter, each should have co-extensive power and authority.*". (Italics added.)

The plaintiff also says (p. 32):

"The statute cannot be construed to mean (and we do not understand the defendants to so contend) that specific matters shall be subject to determination by both the state and by the city and at one and the same time. That would mean chaos, . . ."

What the plaintiff means by "subject to determination" is not clear. Certainly it is competent for the legislature to provide that state health officers and municipal health officers may regulate the same specific matters at the same time. This would not mean "chaos." In many jurisdictions there are constitutional and statutory provisions that expressly give municipalities local home rule over many matters that are regulated by the state. In fact, section 19

of the 1939 Milk Pasteurization Act merely preserves the "home rule" provisions as to milk regulations contained in the 1872 Cities and Villages Act.

The only answer made by the plaintiff to the defendants' analysis of the saving clause is an argument (brief, pp. 36-39) that the defendants' construction of the saving clause means that the statute "is applicable only to rural areas and other small communities" and has only "a limited territorial application"; and the plaintiff then argues that such a construction is untenable. The plaintiff does not correctly state the defendants' contention. The defendants' contention is that the statute is designed to prescribe minimum sanitary standards which are effective throughout the state, both in rural and urban communities. But the statute indicates no intention to go further and occupy exclusively the entire field of regulation. On the contrary, the saving clause says expressly that municipalities may continue to make regulations as broad in scope and as stringent as those authorized under the 1872 statute, so long as the municipal regulations do not fall below the minimum standards fixed by the state. In other words, the statute places a floor under municipal milk regulations.

Conclusion.

This case presents a simple problem. The 1872 statute gave the city power to forbid the use of paper milk containers. The 1939 statute said expressly that nothing therein impairs the power of cities. The words in the saving clause can mean only what they say and the city still has power to forbid the use of paper milk containers. The Circuit Court of Appeals holds that the saving clause is meaningless, as the dissenting opinion points out. This

error and the importance of the case to Illinois municipalities call for the exercise of this court's power of review.

IN THE

Supreme Court of the United States

OCTOBER TERM, A. D. 1941.

No. 706

CITY OF CHICAGO, a Municipal Corporation, BOARD OF HEALTH OF THE CITY OF CHICAGO, DR. ROBERT A. BLACK, Health Commissioner and Acting President of Board of Health of the City of Chicago,
Petitioners,

vs.

FIELDCREST DAIRIES, INC.,
Respondent.

BRIEF OF PETITIONERS.

Opinions of the Courts Below.

The majority and dissenting opinions of the Circuit Court of Appeals (R. 1782-1796) are reported in 122 F. 2d. 132 (1941); the opinion of the District Court (R. 1752-1756) is reported in 35 F. Supp. 451 (1940).

Statement of Jurisdiction.

(a) The jurisdiction of this court is invoked under section 240 of the Judicial Code as amended by the act of

February 3, 1925 [28 U. S. C. 347, par. (a)]. The pertinent languange of the section is as follows:

> "(a) In any case . . . in a circuit court of appeals, . . . it shall be competent for the Supreme Court of the United States . . . to require by certiorari, *either before or after a judgment or decree by such lower court*, that the cause be certified to the Supreme Court for determination by it, and with like effect, as if the cause had been brought there by unrestricted appeal." (Italics added.)

In a sense the judgment of the Circuit Court of Appeals may not be a final judgment, since it reversed and remanded the cause for the purpose of modifying the decree entered by the trial court to conform with the views expressed in the opinion. But the Circuit Court of Appeals made a final determination that the ordinance involved is invalid and the formal modification of the decree is all that remains to be done in the trial court. This alone is enough to permit the Supreme Court to review the cause by writ of certiorari, particularly since the judgment need not be final in the technical sense. This is evident from the language of the section quoted above. And see *Fuller* v. *Otis Elevator Company*, 245 U. S. 489 (1917), where the fact that the judgment was not final was held to be no objection to the granting of the writ.

(b) The judgment of the Circuit Court of Appeals was entered on August 4, 1941 (R. 1797).

Statement of the Case.

The case involves a provision in the milk ordinance of the City of Chicago requiring milk to be delivered in "standard milk bottles."* The Circuit Court of Appeals

* The provision is contained in the third sentence of section 3094 of the ordinance: "Any milk or milk products sold in quantities of less than one gallon shall be delivered in standard milk bottles; . . ." (R. 108).

for the Seventh Circuit has held that this provision of the ordinance is void (R. 1794). A writ of certiorari has been granted to review the holding.

The respondent, Fieldcrest Dairies, Inc. (plaintiff in the trial court), a Michigan corporation incorporated in 1937 (R. 844, 1609-12), filed suit on February 2, 1939 against the petitioners (defendants) in the United States District Court for the Northern District of Illinois, Eastern Division. The respondent had sought a permit from the petitioner Board of Health to sell milk in "Pure-Pak" paper containers in Chicago; the permit had been denied. The complaint (R. 2-15) alleged that the respondent's containers are "sterile, sanitary, and made of non-absorbent material" and are "standard milk bottles" within the terms of the Chicago ordinance requiring milk to be delivered in "standard milk bottles." The action of the petitioners in refusing the permit to sell milk in Pure-Pak containers in Chicago was alleged to be discriminatory and unreasonable, to deprive the respondent of the equal protection of the laws, and to deprive the respondent of its property without due process of law, all in violation of the federal and Illinois constitutions. The complaint prayed (R. 14-15) for (1) a declaratory judgment finding either that the ordinance does not prohibit the respondent from selling milk products in Pure-Pak containers or that, if it does, the ordinance is unreasonable and unconstitutional; and for (2) an injunction restraining the petitioners from interfering with the respondent in selling milk products in Pure-Pak containers in the city. The petitioners filed an answer (R. 16-22) which denied that the respondent's containers are standard milk bottles, are non-absorbent or sterile, or are sanitary containers for the distribution of milk, and denied that the plaintiff is entitled to the relief sought. On motion of the respondent the case was referred

to a master in chancery (the Hon. Jacob I. Grossman) for hearing (R. 123).

While the case was being tried before the master, a new issue arose as to the power of the city to regulate the character of containers used for the distribution of milk within the city. Municipalities in Illinois had been given broad regulatory powers over the production, processing, and distribution of milk by certain provisions of the Illinois Cities and Villages Act of 1872 (Public Laws of Illinois, 1871-72, pp. 231-233, secs. 1, 50, 53, 66, 78), which had not been repealed in 1939 (Ill. Rev. Stat. 1939, ch. 24, secs. 65, 65.49, 65.52, 65.65, and 65.77).* On July 1, 1939, the so-called Milk Pasteurization Plant Act** went into effect (Laws of Illinois, 1939, pp. 660-666; Ill. Rev. Stat. 1941, ch. 56½, secs. 115-134). By this 1939 statute the Illinois General Assembly imposes regulations on the handling, processing, labeling, sale, and distribution of pasteurized milk, including a requirement that single-service (i.e. paper) milk containers be made and transported in a sanitary manner, and authorizes the Director of the Department of Public Health to promulgate minimum requirements for interpretation and enforcement of the act. Section 19 of the act contains a saving clause reading as follows:

> "Nothing in this act shall impair or abridge the power of any city, village or incorporated town to regulate the handling, processing, labeling, sale or distribution of pasteurized milk, and pasteurized milk products, provided such regulation not permit any person to violate any of the provisions of this act." (Ill. Rev. Stat. 1941, ch 56½, sec. 133.)

---

* In 1941 the provisions of the 1872 act were incorporated in a Revised Cities and Villages Act (Ill. Rev. Stat. 1941, ch. 24, secs. 23-1, 23-63, 23-64, 23-105, 23-81.

** The entire act is printed in this brief in *Appendix A*.

The respondent placed reliance on this statute in the presentation of the case to the master (see master's report, R. 1732).

The master heard many witnesses, who testified (R. 132-1396) about the manufacture of paper milk containers, their sanitary and insanitary characteristics, their use and regulation outside of Chicago, and the use of glass milk containers in Chicago. Many exhibits were admitted in evidence (R. 1397-1708). The master filed a comprehensive report (R. 1710-36), recommending the denial of the relief sought. His conclusions were that paper milk containers are not "standard milk bottles" and are forbidden by the Chicago ordinance; that the saving clause in the Milk Pasteurization Plant Act of 1939 preserved the pre-existing home rule of municipalities on the subject of the regulation of milk; and that the ordinance is valid. On the question of the reasonableness of the ordinance the master discussed the evidence in detail (R. 1718-13), made specific findings of fact (R. 1734-35), and found *from the testimony of the respondent's witnesses* that the sanitary characteristics of paper milk containers are such that the Chicago City Council may reasonably have decided that their prohibition was necessary to protect the purity and wholesomeness of milk (R. 1734).

[We do not state the facts about the sanitary aspects of the manufacture, processing, and filling of paper containers, because they are recited in detail in the master's report (R. 1718-22). A summary of the testimony of the principal witnesses is given in *Appendix C* in this brief. *Appendix B* is a glossary of technical terms used in the record.]

The trial judge (the Hon. Charles E. Woodward) sustained objections (R. 1738-49) to the master's report and

rendered a decree (R. 1759-61) in favor of the respondent. The decree contained a declaratory judgment that the respondent's paper milk containers are standard milk bottles. It also enjoined the petitioners from interfering with the sale and delivery by the respondent of milk in the City of Chicago in the respondent's Pure-Pak containers. The opinion of the trial court (R. 1752-56), while devoted chiefly to the proposition that the respondent's paper milk containers are standard milk bottles and are not forbidden by the ordinance, also stated that under the 1939 statute (the Milk Pasteurization Plant Act) the City of Chicago was "without power to prohibit the use of single-service containers if such containers conformed to the provisions of the statute." And the opinion stated that the ordinance would be void if it were construed to forbid the use of paper containers; by this the court meant, as indicated by its findings of fact (R. 1756-58), that the ordinance would be "unreasonable and discriminatory and without any reasonable basis" if it forbade the use of paper milk containers.

On appeal by the petitioners to the Circuit Court of Appeals, the opinion (R. 1782-94) was written by Major, Circuit Judge, joined in by Sparks, Circuit Judge, with Lindley, District Judge, dissenting in part (R. 1795-96). The Circuit Court of Appeals held (opinion, R. 1784-88) that the trial court erred in holding that the ordinance permitted the use of paper milk containers and approved the master's conclusion that the respondent's paper containers are not "standard milk bottles." Judge Lindley did not dissent from this portion of the opinion.

The majority opinion stated (R. 1790-93) that the ordinance was void because contrary to the public policy of the State of Illinois as expressed in the Milk Pasteuriza-

tion Plant Act of 1939. After pointing out that this statute permits the use of single-service containers and that the respondent had obtained a state certificate of approval of its pasteurization plant, the opinion said that the right thus conferred by the state was denied to it by the city ordinance. The opinion also said:

> ". . . the state, upon entering the field not only made provision for the sale and distribution of pasteurized milk but recognized, permitted and approved the use of such containers (single-service or paper milk containers), and the ordinance is squarely in conflict therewith." (R. 1793.)

As for the saving clause in the statute (sec. 19 quoted above), the majority opinion stated that it granted the city "the power to regulate paper containers . . . but we are unable to accept the theory that it has authority to outlaw that which the state has legalized." The majority opinion said also (R. 1794) that there was no occasion "to discuss at length or decide" other questions about the validity of the ordinance. Nevertheless the opinion continued with a brief discussion of factors in the case that were said to rebut the presumption of the validity of the ordinance when attacked on constitutional grounds. The majority opinion concluded that the plaintiff was entitled (a) to a declaratory judgment that the ordinance was void in prohibiting the use of the respondent's paper containers and (b) to an injunction "restraining the defendants from prohibiting, but not from regulating, the use of such containers" (R. 1794).

In his dissenting opinion Judge Lindley (R. 1795-96) stated that the ordinance should be sustained, that he was unable to agree that the ordinance violated the public policy of the State of Illinois as expressed in the 1939 statute. He said that the language of the saving clause "was

not meaningless or surplusage as announced in the majority opinion, but rather in the nature of a declaratory clause maintaining the existing status . . . to assure municipalities that their power to act in the premises was not taken away . . .".

Pursuant to the majority opinion a judgment was entered by the Circuit Court of Appeals, reversing the cause and remanding it for the sole purpose of modifying the decree to conform with the views expressed in the opinion (R. 1797). It requires modifications in the decree of the trial court as follows: while the decree contained a declaratory judgment that the respondent's paper containers are standard milk bottles and are permitted by the Chicago ordinance, the modified declaration will be that the ordinance is invalid in prohibiting the use of the respondent's containers; and while the decree enjoined the petitioners "from in any manner or by any means preventing or in anywise interfering" with the sale and delivery of milk by the respondent in its paper milk containers, the injunction ordered by the Circuit Court of Appeals will restrain the peitioners from prohibiting, but not from regulating, the use of the respondent's containers.

There are thus two questions presented.

(1) The holding of the Circuit Court of Appeals that the City of Chicago did not have power to enact the ordinance forbidding the use of paper milk containers involves the construction of grants of regulatory powers made by the Illinois state legislature to the City of Chicago. The question is: did the Illinois Pasteurization Plant Act of 1939 withdraw from the City of Chicago the power to enact the ordinance granted to the city by the Illinois Cities and Villages Act of 1872?

(2) The complaint alleged (R. 11) that the ordinance deprived the respondent of the equal protection of the laws and of its property without due process of law in violation of both the federal constitution (fourteenth amendment) and the Illinois constitution (sections 2 and 13 of article 2). The trial court found that the ordinance would be unreasonable and discriminatory if it forbade the use of paper milk containers. It was not necessary for the Circuit Court of Appeals to decide this constitutional question, since it held that the city had been deprived of the power to pass the ordinance. Nevertheless the majority opinion of the Circuit Court of Appeals sets forth a number of grounds for holding the ordinance unreasonable, indicating that the majority considered the ordinance unconstitutional (R. 1794). There is here a question of the propriety of a judicial pronouncement that a city regulation is invalid under the fourteenth amendment when there is evidence in the record showing that the ordinance is not unreasonable. If this court should decide that the city has power to forbid the use of paper milk containers, the decision of the constitutional question cannot be avoided. On this issue the specific question, under both the federal and Illinois constitutions, is whether or not the respondent has proved that the ordinance, in forbidding the use of paper milk containers, is so palpably unreasonable as to be arbitrary or capricious, so that the provision bears no reasonable relation to the protection of the public health.

Specification of errors.

(1) The Circuit Court of Appeals erred in holding the provision of the Chicago ordinance to be in conflict with the public policy of the State of Illinois.

(2) The Circuit Court of Appeals erred in directing the issuance of an injunction and declaratory judgment in favor of the respondent.

(3) The Circuit Court of Appeals erred in not reversing the finding of the trial court that the ordinance is unreasonable and unconstitutional if it forbids the use of paper milk containers.

(4) The Circuit Court of Appeals erred in not holding that the judgment of the trial court should be reversed and a decree entered in accordance with the findings in the master's report.

Summary of Argument.

I. The Illinois Milk Pasteurization Plant Act of 1939 did not deprive the city of power to pass the ordinance.

The Illinois Cities and Villages Act of 1872 as construed by the Illinois courts granted power to the city to prescribe the character of the containers in which milk is sold and this included the power to forbid the use of paper milk containers. The power was not impaired by the Milk Pasteurization Plant Law of 1939. This is clear from an analysis of the language and a consideration of the purpose of the saving clause in the statute. The Circuit Court of Appeals' construction of the 1939 statute disregards the plain language of the saving clause and violates elementary rules of statutory construction. The Illinois Supreme Court would not have decided the case as did the Circuit Court of Appeals. This court should decide on the merits the question of the city's power.

II. The ordinance is not invalid on constitutional grounds.

(a) The principles governing the validity of the ordinance under the due process clauses of the federal and Illi-

nois constitutions are well settled. Debatable questions as to the reasonableness of the ordinance are for the legislative body and not the courts to determine. The courts may declare health legislation invalid only if palpably arbitrary or capricious. Regulations of containers and many regulations of the milk industry have been sustained.

(b) Evidence in the record shows that to forbid the use of paper containers for delivering milk is not unreasonable. The master found that there are potential public health hazards in the use of paper milk containers. The Circuit Court of Appeals admitted that there was evidence in the record that their use presents a hazard to health. (1) Paper containers are not sterile when formed and do not receive effective bactericidal treatment before they are filled with milk. (2) Paper containers are absorbent. (3) Paraffin from paper containers gets into the milk placed in them. (4) Odors from paraffin and bacteria in paper containers are imparted to the milk. (5) Effective sanitary control of paper containers requires supervision and control of all processes in the manufacture of paper and its conversion into containers. (6) Paper containers are not transparent and cream does not rise to the top in them.

(c) Factors relied on by the District Court and in the majority opinion of the Circuit Court of Appeals are not controlling. The presumption of validity of the ordinance is as strong as when the ordinance was enacted. The use of paper milk containers elsewhere, their regulation by the State of Illinois and in the model ordinance of the United States Public Health Service, the use of paper containers for other purposes, and the proposal by the Chicago Board of Health that the City Council permit their use for delivering milk are factors that are immaterial both in fact and in

law. The prohibition of the use of paper milk containers is not so unrelated to any possible danger to the public health as to be considered an arbitrary interference with property rights.

ARGUMENT.

I.

The Illinois Milk Pasteurization Plant Act of 1939 did not deprive the city of power to pass the ordinance.

A question of construction of Illinois statutes is presented. The Circuit Court of Appeals held the ordinance invalid on the ground that it is contrary to a public policy of the state found by the court to be expressed in an Illinois statute, the so-called Milk Pasteurization Plant Law of 1939 (Laws of Illinois, 1939, pp. 660-666; Ill. Rev. Stat. 1941, ch. 56½, secs. 115-134).* Illinois cities derive their powers from the state legislature and have only such powers as have been delegated to them by the legislature. *City of Chicago* v. *Murphy*, 313 Ill. 98, 101 (1924). Consequently the acts of the Illinois General Assembly must be looked to for the existence and extent of any power exercised by a city.

There is no constitutional objection to regulation of the same subject by statute and by ordinance. In *City of Chicago* v. *Union Ice Cream Co.*, 252 Ill. 311 (1911), the court said (p. 314):

> "... The great weight of authority is to the effect that the legislature may confer police power upon a municipality *over subjects within the provisions of existing State laws.* An act may be a penal offense

* The entire act is printed as *Appendix A* in this brief.

under the laws of the State, and further penalties, under proper legislative authority, may be imposed for its commission by municipal ordinances. The enforcement of one would not preclude the enforcement of the other. (Citing authorities.) Municipal corporations are bodies politic, vested with many political and legislative powers for local government and police regulations, established to aid the government by the State. The necessity for their organization may be found in the density of the population and the conditions incidental thereto. *Because of this, the municipal government should have power to make further and more definite regulations than are usually provided by general legislation and to enforce* them by appropriate penalties." (Italics added.)

Power of Cities under the 1872 Act.

As originally enacted in 1872, article 5 of the Illinois Cities and Villages Act contained the following provisions:

"Section 1. The city council in cities, and the president and the board of trustees in villages, shall have the following powers:

"Section 50. To regulate the sale of meats, poultry, fish, butter, cheese, lard, vegetables, and all other provisions, and to provide for place and manner of selling the same.

"Section 53. To provide for and regulate the inspection of meats, poultry, fish, butter, cheese, lard, vegetables, cotton, tobacco, flour, meal and other provisions.

"Section 66. To regulate the police of the city or village and pass and enforce all necessary police ordinances.

"Section 78. To do all acts, make all regulations which may be necessary or expedient for the promotion of health or the suppression of disease." (Public Laws of Illinois, 1871-72, pp. 231-233.)

Except for minor amendments not material here, there had been no changes in these provisions in 1939. (Sections 65, 65.49, 65.52, 65.65 and 65.77, ch. 24, Ill. Rev. Stat. 1939.) And these provisions are incorporated in the new Illinois Revised Cities and Villages Act which went into effect on January 1, 1942 (ch. 24, secs. 1-1 to 87-5, Ill. Rev. Stat. 1941), the corresponding sections being sections 23-1, 23-63, 23-64, 23-105, and 23-81, ch. 24, Ill. Rev. Stat. 1941. In fact section 23-63 of the new statute is more specific than was section 50 of article 5 of the 1872 statute in granting municipalities power to regulate the manner of selling milk for human consumption. Section 23-63 reads:

> "To regulate the sale of all beverages and food for human consumption; to locate and regulate the places where and *the manner in which any beverage or food for human consumption is sold; . . .*" (Italics added.)

The provisions of the 1872 act have been interpreted by the Illinois Supreme Court to grant cities very broad regulatory powers over the milk industry. A leading case is *Koy* v. *City of Chicago*, 263 Ill. 122 (1914), where the court held valid an ordinance requiring the use of a certain apparatus for the recording of temperatures during the pasteurization of milk. The court said (p. 127) of the above-quoted sections of the Cities and Villages Act:

> "The regulation of the sale of milk and its products is essential to the preservation of the public health, and authority for its regulation is clearly given to the city council by paragraphs 50, 53, 66 and 78 of section 1 of article 5 of the Cities and Villages act." (Citing cases.)

A more detailed statement of the power of the city under the statute was also made (pp. 130-131):

> "* * * There is no article of food in more general use than milk; none whose impurity or unwholesomeness may more quickly, more widely and more seri-

ously affect the health of those who use it. The regulation of its sale is an imperative duty which has been universally recognized. This regulation in minute detail is essential, and extends from the health and keeping of the cows which produce the milk, through all the processes of transportation, preservation and delivery to the consumer. Not only may laws and ordinances require that milk offered for sale shall be pure, wholesome and free from the bacilli of any disease, but they may and do, in order to produce this result, prescribe the manner in which such purity, wholesomeness and freedom from disease shall be secured and made to appear. The cows may be required to be registered with a designated public authority; the dairies to be conducted and managed according to prescribed regulations, and, together with the dairy utensils, subjected to inspection; the receptacles in which milk is contained to be of prescribed character and capacity; the labels to be placed according to fixed regulations and to contain certain required information; the milk to be prepared in the manner, at the times and by the means directed and at all times to be subject to inspection. These may be drastic restrictions upon a private business, but experience and the increasing knowledge of the causes of disease and the agencies of its propagation have demonstrated the necessity of such restrictions to the preservation of the public health. The object of all such restrictions is the preservation of the public health, and as a means to that end the protection of the general public against dishonest vendors of milk. They all impose inconveniences and expense upon the dealers in milk, but they are not on that account unreasonable, unjust or oppressive. Legislatures and city councils, in the exercise of the police power, may prohibit all things hurtful to the health and safety of society even though the prohibition invade the right of liberty or property of an individual."

The power of Illinois cities to regulate every detail of the milk industry is here said to extend to requiring "the receptacles in which milk is contained to be of prescribed

character and capacity." Before the *Koy* case the state Supreme Court in *City of Chicago* v. *Bowman Dairy Co.*, 234 Ill. 294 (1908), had held valid an ordinance requiring milk bottles to contain a permanent indication of their capacity.

These broad regulatory powers over the milk industry were possessed by the City of Chicago when it passed a comprehensive milk ordinance on January 4, 1935 (R. 23-112). The ordinance contains regulations of many aspects of the production and distribution of milk. Included was the particular provision involved in this case:

> "Any milk or milk products sold in quantities of less than one gallon shall be delivered in standard milk bottles." (R. 108.)

This language required the use of the familiar glass milk containers. (So held the Circuit Court of Appeals in this case, R. 1788, the construction of the ordinance being one of the issues litigated in the lower courts.)

The language of the *Koy* case that a city has power under the Cities and Villages Act to require a milk receptacle to be of prescribed character shows clearly that the City of Chicago had power to require milk to be delivered in standard milk bottles, even though the use of a receptacle that was not a standard milk bottle—such as a paper container—was prohibited. So also other devices of the dairy industry that did not meet the requirements of the ordinance were prohibited. Necessarily a regulation that prescribes a standard forbids what does not meet the standard. This was pointed out by the Illinois Supreme Court in *Haggenjos* v. *City of Chicago*, 336 Ill. 573 (1929), where an ordinance that prohibited parking automobiles on streets during certain hours of the day was attacked on the ground that the power to regulate the use of streets did not include the power to prohibit. Of the relative terms "reg-

ulate" and "prohibit" the Illinois Supreme Court said (pp. 576-577):

> "It has been said often that the power to regulate does not include the power to prohibit; and this is true in the sense that mere regulation is not the same as absolute prohibition. Regulation of business or action implies the continuance of such business or action, while prohibition implies its cessation. On the other hand, *the power to regulate implies the power to prohibit except upon the observation of authorized regulation.* The ordinance does not prohibit the standing of vehicles on all streets throughout the city or at all times, but only on some streets at some times." (Italics added.)

The power to regulate the milk industry and milk containers thus included the power to require a prescribed container, and this power included in turn the power to forbid the use of a container that did not meet the requirements imposed. Under the 1872 statute the City of Chicago thus had power to forbid the use of paper milk containers and to enact the ordinance so providing.

Effect of the 1939 statute on the power of cities.

The title of the Milk Pasteurization Plant Law of 1939 is as follows:

> "An Act regulating the handling, processing, labeling, sale and distribution of pasteurized milk and pasteurized milk products." (Laws of Illinois, 1939, p. 660; Ill. Rev. Stat. 1941, ch. 56½, sec. 115; Appendix A, *infra*.).

Sections 1 to 18 of the act contain numerous regulatory provisions, including a requirement in section 15, item 10, that "single service containers . . . shall be manufactured and transported in a sanitary manner". Section 19 is a saving clause. It is the contention of the petitioners that

this saving clause retains intact the regulatory powers of the city that existed before the enactment of the statute. Section 19 reads as follows:

> "Nothing in this act shall impair or abridge the power of any city, village or incorporated town to regulate the handling, processing, labeling, sale or distribution of pasteurized milk and pasteurized milk products, provided that such regulation not permit any person to violate any of the provisions of this Act." (Ch. 56½, sec. 133, Ill. Rev. Stat. 1941; Appendix A, *infra.*)

The meaning of this saving clause is the vital question on this branch of the case. The Circuit Court of Appeals holds that it did not prevent the impairment by the statute of some of the city's power. The petitioners contend that its positive and unambiguous language has been disregarded by this holding.

It is not necessary to analyze the 1939 act in detail to see if it contains anything that is not covered by the terms of the saving clause. The saving clause is in the language of the title of the act. The title describes the act as one regulating the "handling, processing, labeling, sale and distribution" of milk, and the saving clause states that nothing in the act shall impair the power of the city to regulate the "handling, processing, labeling, sale or distribution" of milk—the identical subjects named in the title. The Illinois constitution contains the common provision that an act may embrace only the subject expressed in the title,* so that any subject in the act that is not embraced in the title is invalid. By using the language of the title in the

---

* "No act hereafter passed shall embrace more than one subject, and that shall be expressed in the title. But if any subject shall be embraced in an act which shall not be expressed in the title, such act shall be void only as to so much thereof as shall not be so expressed. . . ." (Article 4, sec. 13, Illinois Constitution of 1870.)

clause that saves the power of cities and villages, the legislature thus necessarily saved to them their pre-existing power over the entire subject-matter covered by the act. The identity of the language in the saving clause with that in the title thus makes the saving clause as broad as it could possibly be made, so that, whatever aspects of the milk industry may be subjected to state-wide regulation by the statute, cities and villages retain to the fullest extent every power that they had theretofore. This identity of language alone indicates unmistakably that the saving clause preserved the city's power to forbid the use of paper milk containers. But the same result is reached by considering other aspects of the saving clause.

There is only one limitation in the saving clause on this complete retention of the power of cities: the proviso says that city regulation shall "not permit any person to violate any provisions" of the act. By expressing only one exception to the retention of power the legislature has indicated an intention that there is no other exception. This is a clear case for the application of the rule that the expression of one exception excludes other exceptions [see *People* v. *Deep Rock Oil Corp.*, 343 Ill. 388, 401 (1931)]. The ordinance forbids the use of paper milk containers and does not permit a violation of the act. Not being within the exception, the power of the city has been retained.

Only a cursory reading of the saving clause reveals a legislative intention not to make any change whatever in the powers of cities to regulate the sale of milk, including the power to forbid the use of paper milk containers. A detailed exposition of the language of the section leaves no possible doubt of this intention:

"*Nothing in this act . . .*". In spite of these self-explanatory words, the Circuit Court of Appeals finds *some-*

thing in the act that indicates a public policy affecting the powers of cities.

"*. . . shall impair or abridge . . .*". These words mean that the act was intended not to weaken or curtail the power which cities had before the act was passed. Yet the Circuit Court of Appeals holds squarely that the statute makes the city's power less than it was before.

"*. . . the power of any city, village or incorporated town . . .*". The power of cities to regulate milk was derived from the Illinois Cities and Villages Act of 1872 quoted above and interpreted by the Illinois Supreme Court in the *Koy* and other cases.

"*. . . to regulate . . .*". "To regulate" means "to control, govern, or direct by rule or regulation, to subject to guidance or restriction" (Oxford English Dictionary, *regulate*). "Regulate" was the very word used in the grant of power in the Illinois Cities and Villages Act of 1872 quoted above (cities were given power "to regulate the sale of . . . provisions", and to ". . . make all regulations which may be necessary or expedient for the promotion of health or the suppression of disease"). Under that act, as was stated in the *Koy* case, the power to regulate the milk industry included the power to prescribe the character of the receptacle in which milk is sold; and the power to regulate containers included the power to forbid the use of paper containers. The use of the same word "regulate" in the saving clause in the 1939 statute evidences an unmistakable legislative intention that cities may continue to forbid the use of paper containers.

"*. . . the handling, processing, labeling, sale and distribution of pasteurized milk and pasteurized milk products, . . .*". As we have noted, these words describe the field of regulation described in the title of the act. Clearly the

words "sale and distribution" include the type of container in which the product is sold or distributed.

"*. . . provided such regulation not permit any person to violate any of the provisions of this act.*" As we have noted, this single limitation on the power of cities retained by the act indicates an intention that there are no other exceptions. A regulation that forbids the use of particular containers does not permit a violation of any state regulation. This would only be true of a regulation that permitted a type of container forbidden by the statute. The legislature's reason for inserting this proviso in the saving clause is apparent: the other language in the saving clause is so broad that, without the proviso, a city regulation might be valid even though it permitted a violation of the statute.

There is no conflict between the ordinance, which forbids the use of paper milk containers, and the statute which regulates their use. The ordinance cannot be in conflict with a statute that specifically keeps alive the city's power to pass the ordinance. Also, there is no conflict in fact. The statute does not say that paper containers *must* be permitted. It merely recognizes the possible use of paper containers and regulates certain aspects of their use. The City of Chicago's more stringent regulation—forbidding their use—is not in conflict; it merely carries regulation further than the State of Illinois does.

And even aside from the saving clause, the statute permits a city to regulate in the same field. Section 15 of the Act contains 23 items of regulation, requiring in item 10 that single-service containers "shall be manufactured and transported in a sanitary manner." This same section authorizes the Director of the State Department of Public Health to adopt "*minimum* requirements . . . for interpre-

tation and enforcement" of the Act. The use of the word "minimum" indicates that more stringent requirements may be imposed by some agency other than the state. This can only mean a city or a village. The language of the statute thus shows that the legislature intended to permit cities and villages to occupy the same field of regulation as the state and (in the language of the *Ice Cream Company* case) "to make further and more definite regulations."

The purpose of the saving clause is clear. The statute is designed to prescribe minimum sanitary standards that are effective throughout the state, both in urban and rural communities. Some cities and villages, because of special problems created by location or by density of population or merely because of a desire to exercise the utmost vigilance in protecting consumers from contaminated milk, may deem it important to impose higher standards than those imposed by the statute. The necessity for municipal regulation that differs from state regulation was clearly recognized by the Illinois Supreme Court in the *Ice Cream Company* case quoted above (pp. 12-13). It was this necessity that the legislature undoubtedly had in mind in stating in plain and unambiguous language that the power of cities and villages should remain intact. So the saving clause says expressly that municipalities may continue to make regulations as broad in scope and as stringent as those authorized under the 1872 statute, subject to the proviso that the municipal regulations must not fall below the minimum standards fixed by the state. The statute thus places a floor under municipal milk regulations. The power of the City of Chicago to forbid the use of paper milk containers was not affected by the statute.

The Circuit Court of Appeals' construction of the 1939 statute.

While the saving clause says that the 1939 statute shall not impair or abridge the city's power, the Circuit Court of Appeals holds that the city's power is less than it was before the statute was passed. The majority opinion of the Circuit Court of Appeals thus disregards the plain language of the statute. This was the view of the dissenting judge, who in his opinion said that the saving clause "was not meaningless or surplusage, as announced in the majority opinion" but was "in the nature of a declaratory clause maintaining the existing status, inserted by the legislature in an abundance of caution, to assure municipalities that their power to act in the premises was not taken away" (R. 1795). It is significant that the majority opinion does not even mention article 5 of the Illinois Cities and Villages Act of 1872 which, as quoted above, granted the City of Chicago broad regulatory powers over the milk industry.

From the fact that the statute and the regulations of the state Department of Health contain a few regulations of paper containers (such as the provision in item 10 of section 15 that "single service containers . . . shall be manufactured and transported in a sanitary manner"), the majority opinion concludes that "the use of single service containers such as used by the plaintiff for the distribution of milk is permitted and approved upon compliance with the Act" (R. 1791). The opinion stresses the fact that the respondent has complied with the state requirements and has been issued a certificate of approval:

> "By this token it [the respondent] has been authorized by the state to sell and distribute its product within the confines of Illinois in single service contain-

> ers. The city of Chicago, however, by the prohibition contained in its ordinance, denies this right conferred by the State." (R. 1791-92.)

This conclusion fails to take into account the rule that in construing a statute the entire act must be considered. Any certificate of approval granted to the respondent was granted under the statute and, if the respondent may be said to have a "right conferred by the state" to use a container that merely meets state requirements, that right was derived from the statute. This very statute said that the power of cities to forbid the use of paper containers was not impaired. Certainly the "certificate of approval" and any right to use a particular container are effective only within the purview of the statute. As a result a certificate or right granted under the statute is subject to the municipal regulation which the statute expressly permits. When the entire act is considered, this is what the legislature said. The prohibition in the ordinance does not deny a right conferred by the statute when the statute itself says that the prohibition may be imposed.

The basic fallacy in the reasoning of the Circuit Court of Appeals is shown by following the steps by which the conclusion of invalidity was reached. The reasoning of the opinion is: the statute regulates paper containers and permits their use; in prohibiting the use of what the statute permits, the ordinance conflicts with the statute; the rule therefore applies that ordinances may not conflict with the state law; and the saving clause may not be construed to give the city "authority to outlaw that which the state has legalized". The opinion finds the conflict, not with the statute as a whole, but with isolated sections that mention paper containers. The court does not even refer to the saving clause in the statute until *after* it has determined

that the ordinance violates a public policy found in another part of the statute.

In finding a public policy from only a part of the statute and in disregarding the saving clause, the majority opinion violates the familiar rule that in construing a writing the entire writing is to be considered. See *People* v. *Whealan*, 353 Ill. 500 (1933), at p. 506:

> "It is a fundamental rule of statutory construction that the intention of the lawmaker should be deduced from a view of the whole statute and of every material part of it." (Citing many cases.)

Another cardinal rule of construction is violated by the opinion in the disregarding of the language of the saving clause: words should not be held to be surplusage if they may possibly be given effect. In *Crozer* v. *People*, 206 Ill. 464 (1904), the rule was stated (pp. 469-470):

> "It is a cardinal rule of construction that a statute should be so construed that, if it can be prevented, no clause, sentence or word shall be superfluous, void or insignificant, but that it shall be so construed, if possible, that every sentence and word shall be given its ordinary meaning and acceptation. (*Decker* v. *Hughes*, 68 Ill. 33; *Thompson* v. *Bulson*, 78 *id.* 277; *Perteet* v. *People*, 65 *id.* 230.) In the last case the following language from Lord Coke is quoted: '*The good expositor makes every sentence have its operation; gives effect to every word; will not construe it so that anything shall be vain or superfluous, but so expressed that one part of the act may agree with the other and all may stand together.*'" (Italics added.)

In view of the language of the saving clause, the opinion finds in the statute a declaration of public policy that is not there. This again violates a cardinal rule of statutory construction, stated in *Sup* v. *Cervenka*, 331 Ill. 459 (1928), where the Illinois Supreme Court said (pp. 461-462):

"It is an elementary rule in the construction of a statute that the intention of the legislature must primarily be determined from the language of the statute itself and not from conjecture *aliunde*. When that language is plain and unambiguous and conveys a clear and definite meaning there is neither necessity nor authority for resorting to statutory construction. *If the words of a statute are plain and the legislative purpose manifest, that purpose must be given effect. The courts have no legislative powers*, and in the interpretation and construction of statutes *their sole function is to determine*, and within the constitutional limits of the legislative power to give effect to, *the intention of the legislature*. They cannot read into a statute something that is not within the manifest intention of the law-making body as gathered from the statute itself. To depart from the meaning expressed by the words is to alter a statute—it is to legislate and not to interpret. . . ." (Italics added)

It is difficult to understand why the Circuit Court of Appeals went as far as it did in disregarding the language of the saving clause. The opinion says of the petitioners' construction of the saving clause, "It would make the state subservient to the city". The effect of the opinion is that it is beyond the power of a state legislature to prescribe minimum standards to be observed throughout the state and at the same time to authorize municipalities to fix more stringent standards if they consider it necessary to do so. If, in such a situation, the state could be said to be "subservient", it has voluntarily assumed that status and has the power to change it when it sees fit. If the state legislature sees nothing incongruous in such a relationship with its municipalities, the mere fact that it may not coincide with the court's conception of the proper symmetrical organization of government is immaterial.

In many jurisdictions there are constitutional and statutory provisions that expressly give municipalities local

home-rule over matters that are also regulated by the state. In fact the saving clause in the 1939 statute merely preserves the home-rule provisions as to milk regulations contained in the Cities and Villages Act of 1872 (now incorporated in the Revised Cities and Villages Act of 1941).

There is no rule of law that, regardless of the scope of the statutory grant of authority, the municipality may not forbid what the state permits. There is, of course, a rule that when a statute and an ordinance conflict or when an ordinance is contrary to a public policy stated in a statute, the statute controls. This rule has been applied in a number of Illinois cases, some of which are cited in the opinion of the Circuit Court of Appeals. *Village of Atwood* v. *Cincinnati, etc. R. Co.*, 316 Ill. 425 (1925); *City of Marengo* v. *Rowland*, 263 Ill. 531, 534 (1914); *City of Chicago* v. *Union Ice Cream Mfg. Co.*, 252 Ill. 311, 315 (1911); *City of Chicago* v. *Drogasawacz*, 256 Ill. 34, 37 (1912). But this rule applies only when the contrary intention of the legislature is not revealed by the express language of the statute. The rule has no application when the intention of the legislature is expressed in clear language as in the saving clause of the Milk Pasteurization Plant Law of 1939. Nevertheless, this seems to be the rule applied by the two majority judges of the Circuit Court of Appeals.

The Circuit Court of Appeals does not mention the most pertinent Illinois case construing legislative grants of municipal power: *City of Ottawa* v. *Brown*, 372 Ill. 468 (1939). It is the most pertinent case because the statute construed contained a saving clause.

The *City of Ottawa* case involved a 1930 ordinance that contained detailed regulations of gasoline filling stations; the defendant was accused of erecting a filling station without frontage consents as required by the ordinance. An

Illinois statute of 1919 regulated "the storage, transportation, sale and use of gasoline" and authorized the state Department of Trade and Commerce to adopt regulations "except in cities or villages where regulatory ordinances upon the subject are in full force and effect." The question in the case was whether or not the saving clause was operative, in view of the provisions of the Cities and Villages Act of 1872* authorizing cities "to regulate and prevent storage . . . of petroleum" and an ordinance of 1916 regulating only the storage of gasoline and not undertaking to regulate filling stations. The court held that by virtue of the 1916 ordinance the city had sufficiently exercised its powers under the 1872 statute to enable it either to amend the 1916 ordinance *or to adopt a broader one;* and that consequently the 1930 ordinance was authorized and valid.

This *City of Ottawa* case presents a great contrast to the holding of the Circuit Court of Appeals. The Illinois Supreme Court held there that the 1919 saving clause, which was less extensive than the one here, preserved the pre-existing powers of the city granted in the 1872 act. The Illinois Supreme Court did not disregard the saving clause but interpreted it broadly and gave full effect to it. Here the Circuit Court of Appeals has not only failed to consider the 1872 act, but has disregarded the language of the 1939 saving clause. It has also disregarded this recent decision by the Illinois Supreme Court showing how the state courts construe legislative grants of municipal

* This is the very statute involved in the case at bar, article 5 of the Cities and Villages Act of 1872 (Public Laws of Illinois, 1871-72, pp. 231-233). Article 5 contains broad grants of powers to cities and villages. While the *City of Ottawa* case involved section 65 of article 5, the instant case involves sections 50, 53, 66, and 78, now incorporated in the Revised Cities and Villages Act (1941) as sections 23-63, 23-64, 23-105, and 23-81 (ch. 24, Ill. Rev. Stat. 1941).

power. Undoubtedly the Illinois Supreme Court would not have decided the case at bar as has the Circuit Court of Appeals.

It is true that the majority opinion of the Circuit Court of Appeals attempts to give the saving clause some vitality by saying:

> "The courts of Illinois have frequently recognized that power exercised by municipalities may be conferred or withdrawn by implication (citing cases). It therefore appears reasonable that the sole purpose of the saving clause was to prevent a construction by implication, withdrawing the vast authority which the city had theretofore had over the milk industry. The ordinance of the City of Chicago and regulations of its Board of Health disclose scores of ways and means by which the industry is regulated, extending from the health of the cow producing the milk, to its delivery at the home of the consumer. The purpose of the saving clause, in our judgment, was to preserve in the city the unquestioned right to continue in a field which had been entered by the state, and in which, thereafter, each should have co-extensive power and authority." (R. 1792-93.)

If the city and the state have "co-extensive power and authority," it would seem that the city has power to forbid the use of paper milk containers; the state clearly has the power even though it has not been exercised. The court's own statement of the purpose of the saving clause is thus inconsistent with its holding that the city regulation is invalid.

This self-contradiction is inevitable, for the language of the opinion cannot conceal the fact that the holding nullifies the saving clause. If there is a need for both city and state regulations, as evidenced by the saving clause, there are bound to be differences between them. *Any city regulation that goes further than the minimum state regu-*

lations forbids what the state regulations permit. Under the holding of the Circuit Court of Appeals, all that remains of the city's power to protect its citizens from a contaminated milk supply would seem to be the empty authority to make regulations that coincide with state regulations. It seems clear that this holding invalidates other provisions of the milk ordinances of Illinois municipalities. For example, section 7 of the 1939 statute contains labeling provisions, requiring milk containers to be marked with the name of the contents, with the word "pasteurized" if the contents are pasteurized, and with the name and the post office address of the pasteurization plant. The labeling provisions in the Chicago ordinance (sec. 3090, R. 37-38) are much more extensive, requiring (among other things) that the date on which the milk is to be sold shall be marked on the container, a regulation designed to insure that too great an interval of time does not elapse between pasteurization and sale to the consumer. The statute permits the use of undated containers and "approves" their use, while the ordinance prohibits the use of undated containers. If the holding of the Circuit Court of Appeals stands, the city requirement is invalid because it conflicts with the "public policy" of the state as expressed in the statute.

The effect of the decision of the Circuit Court of Appeals is far-reaching. Not only the City of Chicago but every city and village in Illinois is deprived of power to make effective local regulations of the milk industry. And the decision goes further. The boundary between the fields of state and local regulations may not be clearly defined. The decision of the Circuit Court of Appeals in effect takes away from the state legislature the power to fix the boundary and the court, in the exercise of its function to construe statutes, assumes the power itself. In fixing the

boundary where it did, the Circuit Court of Appeals has affected adversely the regulatory powers of Illinois cities and villages over other subjects that the state has begun to regulate.

This case presents a simple problem. The 1872 statute gave the city power to forbid the use of paper milk containers. The 1939 statute said expressly that nothing therein impairs the power of cities. The words in the saving clause can mean only what they say and the city still has power to forbid the use of paper milk containers. The 1935 ordinance is therefore valid and the Circuit Court of Appeals erred in holding it invalid because beyond the city's power.

* * * * * * *

The petitioners urge this court to decide on the merits the local question of the city's power.

The petitioners do not ask the court to reverse the case on the mere ground that the Circuit Court of Appeals, as a result of the holdings in *Hawks* v. *Hamill,* 288 U. S. 52 (1933) and *Railroad Commission of Texas* v. *Pullman Co.,* 312 U. S. 496 (1941), should have refused to order an injunction based on its decision of the local, state question of the city's power. The position of the petitioners on this aspect of the case requires an explanation.

The question of the city's power under the 1939 statute was not raised and could not have been raised in the complaint, for the complaint was filed in February, 1939 and the 1939 statute did not become effective until July 1, 1939. The prayer of the complaint (R. 14) sought a declaratory judgment and an injunction on two alternative grounds: (a) the Chicago ordinance permits the respondent to use paper milk containers or (b), if not, the ordinance is un-

constitutional. The only indication in the record about how the question of the city's power was first raised is the statement in the master's report (R. 1732) that the "plaintiff refers" to the statute. The master disposed of the point in one sentence, saying that section 19 "preserves the pre-existing home rule of municipalities" (R. 1732). Similarly the opinion of the trial court discussed the point in only one sentence, saying that under the statute "the city is without power to prohibit" the use of paper milk containers (R. 1756). The trial court's findings of fact, conclusions of law, and decree (R. 1756-1761) did not find or decide that the ordinance conflicts with the 1939 statute, but merely said that the respondent's containers conform with the provisions of the statute. The majority opinion of the Circuit Court of Appeals indicates that the court's decision against the defendants was based on the holding that the city's power was impaired by the 1939 statute, although the two majority judges also indicated that they considered the ordinance unconstitutional.

To remand the cause to the District Court with directions to retain it pending the determination of the state issue in the state courts, as was done in the *Pullman Company* case, would bring much inconvenience to the litigants. The rulings of the lower courts adverse to the city have clouded the powers of Illinois municipalities. Only by obtaining from this court a decision that the city has power to enact the ordinance may the city be restored to the position it had before the decision by the Circuit Court of Appeals. The suit was begun more than two and a half years ago and has gone through the lengthy process of extensive master's hearings, hearings in the trial court on objections to the master's report, an appeal to the Circuit Court of Appeals, and now a review by this court on peti-

tion for certiorari.* If the cause were remanded to await a determination of the question by the highest state court, the far-reaching effects of the action of the Circuit Court of Appeals in cutting down the powers of Illinois municipalities will remain operative for many months to come. The damage done should be remedied as soon as possible.**

There are several factors present here that were absent in the *Pullman Company* case. (1) We have noted the inconvenience to the litigants and the continuance of doubt as to the powers of Illinois municipalities that would result from a remandment of the case for a determination of the question in the state courts. (2) Moreover, unlike the *Pullman Company* case, this case was not instituted for the purpose of having the federal courts determine the local question. One policy behind the decision in the *Pullman Company* case seems to be to discourage litigants

---

* In connection with the duration of the litigation, it is important to realize that the petitioners have been unable to take advantage of the provisions of section 266 of the Judicial Code (28 U. S. C. 380) for the speedy determination of constitutional questions in the trial court and on appeal. This is the familiar provision that an application for an injunction to restrain state officers in the enforcement of a statute on the ground of its unconstitutionality shall be heard and determined by three judges and that a direct appeal may be taken to this court from the decree granting or denying the injunction. In this case the respondent sought an injunction on the ground that the ordinance was unconstitutional, the trial court so found, and the trial court entered the injunction prayed. Since the question is the constitutionality of an ordinance rather than the constitutionality of a statute, petitioners have been unable to have the matter determined by a three-judge trial court or to appeal directly to this court. There have been a number of decisions to the effect that section 266 of the Judicial Code does not apply to ordinances. *Cumberland Telephone & Telegraph Co.* v. *City of Memphis*, 198 F. 955 (D. C. Tenn. 1912); *City of Baton Rouge* v. *Baton Rouge Waterworks Co.*, 30 F. 2d 895 (C. C. A. 5th, 1929).

** It has been suggested that the delay caused by a remission of the case to the state courts may be a determinative factor in the decision of this court to pass upon the local question. 54 *Harv. L. Rev.* 1379, 1384 (1941).

from bringing local problems into the federal courts. This policy does not require a remission of this case to the state court when the local question comes into existence, as here, after the filing of the suit and even after the trial of the case has begun (hearings before the master began May 31, 1939, R. 132, and the 1939 statute went into effect on July 1, 1939; at that time the master had heard important testimony, R. 144-440, and depositions had been taken, R. 1333-1396). (3) Unlike the local questions in the *Hawks* and *Pullman Company* cases, the question of the city's power is free from difficulty. This is apparent from the preceding argument. Here, without looking to the decisions of the Illinois courts, it is necessary only to read the plain language of the saving clause in the 1939 statute in order to determine that the statute has not impaired the city's power.

For these reasons the petitioners urge this court to decide the question of the power of the city to enact the ordinance under the 1872 and 1939 state statutes.

II.

The ordinance is not invalid on constitutional grounds.

The validity of the ordinance under the federal and Illinois constitutions was questioned in the complaint. It alleged (R. 11) that the ordinance deprives the respondent of the equal protection of the laws and of its property without due process of law in violation of the fourteenth amendment to the federal constitution * and article 2, section 2 (a due process clause similar to the fourteenth amendment clause) of the Illinois constitution.** Most of

* U. S. Const., Art. XIV, sec. 1: ". . . nor shall any state deprive any person of life, liberty or property, without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws."

** Ill. Const. of 1870, art. II, sec. 2: "No person shall be deprived of life, liberty or property, without due process of law."

the evidence heard by the master dealt with the reasonableness of the ordinance as an exercise of the police power. The trial court found, contrary to the master's findings (R. 1734), that the ordinance was unconstitutional (R. 1757). The majority opinion of the Circuit Court of Appeals states (R. 1794) that it does not "discuss at length or decide" this question. However, the opinion continues with a brief discussion of the question that indicates that the two majority judges considered the ordinance unconstitutional. The presumption that the ordinance is valid is said to be "little more than a shadow" because, when the ordinance was passed, the use of paper containers was in its incipient stage. And the evidence in the record that the use of such containers presents a hazard to health is said to carry "little, if any, conviction" in view of other factors—chiefly the fact that the containers are permitted elsewhere.

We discuss as one question (as did the lower courts) the reasonableness of the ordinance under the due process clauses of the federal and Illinois constitutions, although one clause presents a question of federal law and the other a question of state law; as shown by the cases cited below, the same principles govern each clause. And the same discussion covers the question of whether or not the record contains proof of the allegation of the complaint that the respondent is deprived by the ordinance of the equal protection of the laws.

In casting doubt on the constitutional validity of the ordinance, the Circuit Court of Appeals has committed the error of substituting its judgment for the judgment of the Chicago City Council as to the need for the ordinance. Even though only a dictum, this judicial pronouncement of the unreasonableness of the ordinance is an interference with legislative discretion in view of the evidence in the

record. And the constitutional question must be decided if this court holds that the city had power to pass the ordinance. For these reasons the law as to the validity of legislation enacted under the police power and the evidence as to potential public health hazards in the use of paper milk containers must be considered.

(a) Principles governing the validity of the ordinance under the due process clause.

The rules for determining the reasonableness of legislation enacted under the police power have been announced in many opinions. We note a few illustrative cases that indicate the scope of judicial review. In *Standard Oil Company* v. *City of Marysville*, 279 U. S. 582 (1928), the court considered the validity of an ordinance which required that all tanks used for the storage of petroleum products be placed underground. Considerable evidence was heard about the relative safety of storage above and beneath the ground. Mr. Justice Stone delivered the opinion of the court and said (p. 584):

> "We need not labor the point, long settled, that where legislative action is within the scope of the police power, fairly debatable questions as to its reasonableness, wisdom and propriety are not for the determination of courts, but for that of the legislative body on which rest the duty and responsibility of decision." (Citing many cases.)

In *Laurel Hill Cemetery* v. *San Francisco*, 216 U. S. 358 (1910), the court considered the validity of an ordinance which prohibited the burial of the dead within the city and county limits. The ordinance was attacked on the ground that there was no hazard to public health in the maintenance of cemeteries within cities. The court in its opinion (by Mr. Justice Holmes) showed clearly its re-

luctance to substitute its judgment for that of the municipal legislative body (p. 365):

> "But the propriety of deferring a good deal to the tribunals on the spot is not the only ground for caution. If every member of this bench clearly agreed that burying grounds were centers of safety, and thought the board of supervisors and the supreme court of California wholly wrong, it would not dispose of the case. There are other things to be considered. Opinion still may be divided, and if, on the hypothesis that the danger is real, the ordinance would be valid, we should not overthrow it merely because of our adherence to the other belief. Similar arguments were pressed upon this court with regard to vaccination, but they did not prevail. On the contrary, evidence that vaccination was deleterious was held properly to have been excluded." (Citing *Jacobson* v. *Massachusetts,* 197 U. S. 11 (1904), where the compulsory vaccination statute of Massachusetts was held valid.)

Schmidinger v. *Chicago,* 226 U. S. 578 (1912), involved the validity of an ordinance prescribing the weights for loaves of bread and prohibiting the sale of any loaves of bread which did not comply with the prescribed weights. Concerning the validity of this ordinance the court said (pp. 587-8):

> "* * * It is contended that the limitation of the right to sell bread which this ordinance undertakes to make in fixing a standard loaf * * * is such an unreasonable and arbitrary exercise of legislative power as to render it unconstitutional and void. This court has frequently affirmed that the local authorities intrusted with the regulation of such matters, and not the courts, are primarily the judges of the necessities of local situations calling for such legislation, and the courts may only interfere with laws or ordinances passed in pursuance of the police power where they are so arbitrary as to be palpably and unmistakably in excess of any reasonable exercise of the authority conferred." (Citing many cases.)

The presumption that the ordinance is valid is as strong on appeal as in the trial court. In *So. Carolina State Highway Dept.* v. *Barnwell Bros.*, 303 U. S. 177 (1936), a three-judge district court enjoined the enforcement of a statute forbiding the use on highways of trucks exceeding a prescribed width. In reversing the decision of the trial court, Mr. Justice Stone said at pp. 191-2:

> "Since the adoption of one weight or width regulation, rather than another, is a legislative not a judicial choice, *its constitutionality is not to be determined by weighing in the judicial scales the merits of the legislative choice and rejecting it if the weight of evidence presented in court appears to favor a different standard.* (Citing cases.) Being a legislative judgment it is presumed to be supported by facts known to the legislature unless facts judicially known or proved preclude that possibility. Hence, in reviewing the present determination *we examine the record, not to see whether the findings of the court below are supported by evidence, but to ascertain upon the whole record whether it is possible to say that the legislative choice is without rational basis.* (Citing cases.) Not only does the record fail to exclude that possibility, but it shows affirmatively that there is adequate support for the legislative judgment." (Italics added.)

The Illinois Supreme Court applies the same rules as the United States Supreme Court in considering the validity of legislation enacted under the police power. See *People* v. *Quality Provision Co.*, 367 Ill. 610 (1938), where the court noted that legislation will not be held unreasonable if the subject may be regarded as debatable (p. 614). See also *Gundling* v. *City of Chicago*, 176 Ill. 340 (1898); *City of Chicago* v. *Bowman Dairy Co.*, 234 Ill. 294 (1908); *City of Chicago* v. *Arbuckle*, 344 Ill. 597, 604-5 (1931).

These principles have recently been applied to uphold the regulation of containers in a case that seems controlling in the case at bar: *Pacific States Box & Basket Co.*

v. *White,* 296 U. S. 176, 181-182 (1935). The regulation there held valid required that raspberries and strawberries be packed only in certain containers called "hallocks" of specified dimensions. One of the reasons there given by Mr. Justice Brandeis for holding the regulation not invalid was that "the character of the container may be an important factor in preserving the condition of raspberries and strawberries, which are not only perishable but tender." At page 182 Mr. Justice Brandeis said:

> "Different types of commodities require different types of containers; and as to each commodity there may be reasonable difference of opinion as to the type best adapted to the protection of the public. Whether it was necessary in Oregon to provide a standard container for raspberries and strawberries; and, if so, whether that adopted should have been made mandatory, involve questions of fact and of policy, the determination of which rests in the legislative branch of the state government. The determination may be made, if the constitution of the State permits, by a subordinate administrative body. With the wisdom of such a regulation we have, of course, no concern. We may enquire only whether it is arbitrary or capricious. That the requirement is not arbitrary or capricious seems clear. That the type of container prescribed by Oregon is an appropriate means for attaining permissible ends cannot be doubted."

A great variety of regulations of the milk industry have been sustained. In *Koy* v. *City of Chicago,* 263 Ill. 122, 130 (1914), the Illinois Supreme Court termed the regulation of the sale of milk "an imperative duty." *Nebbia* v. *New York,* 291 U. S. 502 (1933), upheld a state law that authorized an administrative board to regulate the price of milk. (The opinion of Mr. Justice Roberts at pp. 521-530 contains a comprehensive review of cases involving police power regulations.) We cite other cases holding milk regulations valid as indicated:

Adams v. *Milwaukee*, 228 U. S. 572, 583 (1911), an ordinance prohibiting milk to be brought into the city unless it was produced by tuberculin tested cattle.

Commonwealth v. *Wheeler*, 205 Mass. 384, 91 N. E. 415 (1910), a statute fixing a minimum standard of butter fat content for milk and prohibiting the sale of substandard milk.

City of Milwaukee v. *Childs Co.*, 195 Wis. 148, 217 N. W. 703 (1928), an ordinance prohibiting the sale of milk except in the original containers.

Pacific Coast Dairy v. *Police Court*, 214 Cal. 668, 8 Pac. 2d 140 (1932), a statute imposing a penalty for not returning milk containers marked with the registered brand of the owners.

City of Chicago v. *Bowman Dairy Co.*, 234 Ill. 294 (1908), an ordinance requiring milk bottles to contain a permanent indication of their capacity.

(b) Evidence in the record shows that the prohibition of paper containers for delivering milk is not unreasonable.

There is no need to labor the obvious point that the regulation of the distribution of fresh milk is a vital necessity, particularly in a city the size of Chicago. The production and distribution of 1,300,000 quarts of an easily contaminated liquid daily consumed in Chicago obviously give rise to special problems of regulation. And a peculiar importance is attached to milk regulations by the fact that milk is the staple item in the diet of infants.

The master heard much evidence on the question of the validity of the ordinance as a reasonable exercise of the police power. More than twenty witnesses testified for the

respondent (R. 132-940, R. 1243-1306) and nine witnesses testified for the petitioners (R. 942-1242). Approximately 120 exhibits were admitted in evidence (R. 1397-1708). There was admittedly testimony by some of the respondent's witnesses that the respondent's containers are sufficiently sanitary to permit their use for delivering milk. On the other hand, the testimony of the respondent's own witnesses revealed that paper containers have characteristics that create serious public health problems.

This is apparent from the master's report. After reciting the facts about the manufacture, processing, and filling of paper containers (R. 1718-22), the master found (R. 1723) that a legislative body might reasonably conclude that contamination might occur at one or more of the many stages from the pulp to the sealed container through carelessness, desire to save expense, inadequate facilities, or other reason. The master then discussed the evidence and made findings about the following matters: absorbency of paper containers (R. 1723-24), paraffin particles in the milk (R. 1724), odors from paraffin or bacteria (R. 1724-26), effective sanitary control of paper containers (R. 1726-29), non-transparency of paper containers and non-rising of cream to the top of containers (R. 1729-30). The master continued with the following general finding:

> "I find that there is evidence in the record, from plaintiff's own witnesses, independent of the corroborative testimony of Dr. Arnold, the City's witness, from which the City Council could reasonably have concluded that prohibition of paper containers was necessary and appropriate to protect the purity and wholesomeness of milk, or, to state the proposition another way, it is at least doubtful whether plaintiff has proved that there is not sufficient evidence tending to establish a reasonable basis for such conclusion." (R. 1734.)

The master then made specific findings of fact (R. 1734-35):

"I find that the legislative body may reasonably have based its decision on evidence tending to prove the following:

"There are steps in the manufacture, conversion and filling of paper containers in which bacteria may get into the walls of the containers.

"Paper containers, even when paraffined, are to some extent absorbent and the milk may absorb such bacteria.

"Sanitary conditions differ from one paper mill to another and even in the same mill from time to time.

"The sanitary condition of the mill is a significant factor as to the condition of the finished container.

"The sanitary condition of the paper board blank determines the sanitary condition of the finished container.

"Particles of paraffin get into the milk and constitute a foreign substance which preferably should not be in milk, especially for babies.

"Odors from paraffin, whether the paraffin is fresh or not, may get into the milk.

"If the paper board contains a high amount of bacteria, there may exude objectionable odors which may get into the milk.

"The control and precautions by paper manufacturers themselves may not be adequate.

"In the case of glass milk bottles, the City has the cleaning process at hand locally and can exercise complete control; in the case of paper containers, inspection at remote places may be necessary but impractical or too expensive.

"Some paper containers have been shown to contain high bacterial counts.

"Paper containers are not transparent as glass bottles, so that it is difficult to observe the quality of the milk or whether the milk contains dirt or other foreign body.

"Cream does not rise to the top in paper containers, so that purchasers may not readily know whether they are getting milk of the required fat content.

> "The United States Public Health Service Sanitation Board in June 1939 criticized paper containers on account of their absorbency and the sloughing off of paraffin."

The master concluded that the court must hold the ordinance valid and the prohibition of paper containers reasonable, and recommended that the court should not issue the injunction or render the declaratory judgment requested. (R. 1735-36.)

The majority opinion of the Circuit Court of Appeals said of the evidence about the reasonableness of the ordinance: *"It is true the record discloses some evidence in support of defendants' contention that the use of such containers presents a hazard to health"* (R. 1794). Without more this evidence would seem to be enough, under the applicable principles of law discussed above, to show that a court would be interfering with the legislative discretion of the Chicago City Council in holding that the ordinance was unreasonable in forbidding the use of paper milk containers. This was the view of the dissenting judge who stated:

> "The master found upon substantial evidence a number of facts bearing upon the undesirability of the use of paper milk bottles, showing clearly that at least the question of desirability of their use is debatable. In such case the city council is entitled to exercise its own administrative and legislative judgment,—a judgment not to be superseded by verdict of a jury or decision of a court." (Citing cases.) (R. 1796.)

This being the state of the record, the case of *Standard Oil Company* v. *City of Marysville*, 279 U. S. 582 (1928), shows that the record establishes the reasonableness of the ordinance as an exercise of the police power. In that case, as in the instant case, voluminous evidence was taken before the master. There much of the evidence was "con-

flicting, speculative and theoretical in character, concerning the relative safety of storage of petroleum products above and beneath the surface of the earth" (opinion, pp. 583-584). The master there made elaborate findings of fact, concluding that the ordinance was invalid, and the master's report was followed by the trial court. The action of the Circuit Court of Appeals in reversing the trial court was upheld in the Supreme Court. The findings of the master, although adverse to the validity of the ordinance, showed that there were dangers involved in storing gasoline above-ground as well as below-ground, the latter being required by the ordinance. Of the master's findings Mr. Justice Stone said (p. 584):

> "To determine that the present ordinance was a permissible exercise of legislative discretion, as thus defined, we need not go beyond those findings of the master to which petitioners offer no serious challenge."

So here the findings of the master based upon the testimony of the respondent's own witnesses show that the prohibition of the use of paper milk containers was a permissible exercise of legislative discretion.

This is apparent from a discussion of some of the characteristics of paper milk containers which show that their prohibition is clearly warranted by the necessity of protecting the city's milk supply. The following discussion is based almost exclusively on the testimony of the respondent's witnesses.

1. Paper milk containers are not sterile when formed and do not receive effective bactericidal treatment before they are filled with milk.

The complaint alleged repeatedly that the paper container advocated by the respondent is "sterile" (R. 4-8). To support these allegations the respondent's witnesses

resorted to a novel definition of what was termed "commercial sterility," and thus were enabled to testify that paper containers are "commercially sterile." This is illustrated by the following excerpts from the direct examination of Dr. Tracy:

> "Q. Have you an opinion from your experiments and from your research work, Doctor, now, as to whether this Pure-Pak Container is a sanitary sterile milk container?
>
> "A. I consider the Pure-Pak Container a sanitary container. I wouldn't consider it was sterile, if you put the proper interpretation on the word 'sterile'" (R. 510).

The evidence shows that empty paper containers may have bacterial counts higher than the permissible maximum. The respondent's witness Woodman testified about the bacterial content of paraffined, unfilled paper containers from the respondent's plant. Seven per cent of the hundred containers examined by the witness showed a bacterial count of more than the permitted maximum of 1000 per quart (R. 674). Prucha's examination of 70 examples of paper board, designed for use in paper milk containers and submitted by 5 different paper mills, showed that 42 samples of the 70 examined had a bacterial content, by disintegration test, of more than 100 colonies per gram, the maximum number permitted by the standard set by the United States Public Health Service in 1939. *Four* of the 70 samples examined showed no growth (R. 792-7; defendant's exhibit 7, R. 1671).

Because of the great heat applied, glass containers are absolutely sterile when manufactured (R. 169). Although a glass container is reused, it is thoroughly cleaned before each use, and the respondent's witnesses testified that with the best method of sterilization it is possible to obtain

a sterile glass container (Sanborn, R. 170). Dr. Tracy, an admitted partisan of paper containers (R. 526), testified that he had frequently visited dairies in Chicago (R. 659, 708-9) and had never observed any discrepancies in the washing of bottles in Chicago (R. 488-9). As to bacterial counts made at the University of Illinois dairy, he also testified that bottles washed in a soaker-type bottle washer ("operated essentially on the standards of the City of Chicago," R. 162) did not have a bacterial content higher than 600 per bottle (R. 490).

Not only is the paper in the paper container not sterile as manufactured; it cannot be made sterile before it is filled with milk. Paper containers are dipped in hot paraffin before they are filled with milk, but the application of paraffin does not produce an effective bactericidal result. There is an agreed statement in the record that, if the respondent's witness Prucha performed an experiment to ascertain whether or not the application of paraffin had a bactericidal action, the result would be: "paraffining will not kill all of the bacteria in the paper" (stipulation, par. 6, R. 127).

Dr. Sanborn testified that in his opinion the primary purpose of the application of paraffin is to moisture-proof the container, and "in addition to that, the paraffining *may* act as an additional sanitary safeguard, in that *certain* bacteria which *may* be present *might* be killed by the temperature of the melted paraffin" (R. 176). He testified again (R. 194) that paraffin as applied to paper containers "is not an effective sterilizing agent."

Perhaps the most significant evidence of the lack of effectiveness of paraffin as a bactericidal agent lies in the stress placed upon sanitary conditions in the mill in which the paper is manufactured by all of respondent's witnesses

who had any real knowledge of the sanitary condition of paper containers. If the application of paraffin was an effective sterilizing and moisture-proofing process, then it would be unnecessary to devote any attention whatsoever to the sanitary conditions under which the paper was manufactured. The record shows, however, that all of the energy of the leading scientists who have considered the subject is devoted to the matter of achieving sanitary conditions in paper mills and in the subsequent processing of the paper into containers. (See articles, Prucha, *Are Paper Milk Containers Sanitary?*, R. 1600-08; Sanborn *Mircrobiology in Pulp & Paper Manufacture*, R. 1665-70.)

It is not unreasonable to require the use of a container that can be sterilized immediately before use, as opposed to one that cannot be so sterilized.

2. Paper containers are absorbent.

The complaint alleged repeatedly that the respondent's paper container was non-absorbent (R. 4, 5, 8). During the course of the trial this allegation was demonstrated to be completely false by the respondent's own witnesses. Dr. Prucha stated that experiments to be made pursuant to a stipulation between the parties would show that paraffined paper containers were absorbent. The object of Experiment No. 1 was to ascertain whether or not fresh fluid milk would absorb substances contained in the cardboard wall of the finished container. Dr. Prucha's answer was affirmative (Stipulation, R. 127-28). All of the containers examined by Dr. Prucha showed absorption (R. 802). Dr. Tracy testified (R. 524) that he found Pure-Pak containers absorbent.

The United States Public Health Service states:

> "The porous condition of paraffined containers now available and the sloughing off of particles of paraffin into the product are undesirable, and manufacturers of single-service containers are urged to make every effort to provide a non-absorbent non-flaking surface" (plaintiff's exhibit 61, R. 1591).

The absorbency of paraffin paper containes is of the utmost significance. It means that whatever is in the paper gets into the milk, even though the absorption is slight. As a result, the sanitary condition of the container does not depend merely upon the surface of the container but upon the sanitary condition of the paper from which the container is made. Another result is that the sanitary condition of the container cannot be effectively controlled by inspection and supervision of the dairies in which milk is placed in the container; the sanitary conditions in the paper mill in which the paper is manufactured determine to a large extent the sanitary quality of the container. The following paragraphs from Dr. Sanborn's direct examination indicate the importance of the sanitary condition of the paper from which containers are made:

> "The condition of the paper from which the container is made, the condition of the paper blank, the bacteriological condition of the paper determines the condition of the finished container. We have proven bacteriologically and by scientific methods that the paper blank that has a low bacterial count yields containers that have low bacterial count. On the other hand, paper board that has high bacterial counts—and of course there have been many such, because this thing has been in experimentation for a long time, and you run into paper board that has higher bacterial counts and those containers will also have high bacterial counts; so there is a direct connection between the sanitary condition of the blank and the sanitary condition of the finished container. That was

true in spite of any of the other factors I mentioned. Our investigation included, for example, investigation of paraffin. There are only three things, the paper, the adhesive that closes it and moisture proof paraffin that moisture proofs it. We were able to show and it has been proven conclusively that the paraffin is not a source of appreciable contamination: in fact, fully refined paraffin and used paraffin are essentially sterile. My investigation of adhesives has shown that there is no contamination from the adhesives, I mean the adhesives used are essentially sterile; so that that eliminates those two factors, that we went to right from the start. That leaves the paper board and that is one of the direct reasons why I stated that the bacteriological condition of the original board determines the final condition of the finished container bacteriologically; it is fundamentally important; it is essential that the paper board have a low bacterial count'' (R. 193-94).

"* * * Dirty contaminated paper board must never be used for milk because bacteriological tests on such board, even well paraffined board, are not satisfactory. The board used must be a sanitary bacteria-free board, essentially bacteria-free, to start with'' (R. 195).

Dr. Tracy testified to the same effect and emphasized the sanitary condition of the water used in the paper mill as important in determining the sanitary condition of the container. Dr. Tracy had tested the quality of the water supply at two paper mills then engaged in making paper for milk containers. Both water supplies showed the presence of B-coli—the sewage or intestinal bacteria. One of these mills was the mill at which the paper in respondent's container is manufactured (R. 512-13).

Perhaps the clearest connected picture of the sanitary significance of the absorbency of paper containers is in the testimony of the respondent's leading witness, Dr. Sanborn (R. 198-222, 230-43). Another interesting discussion of problems of mill sanitation by the respondent's witness,

Dr. Sanborn, appears in his article, *Microbiology in Pulp and Paper Manufacture* (R. 1665-70).

If paper containers were not absorbent, the material of which they were made and the sanitary conditions surrounding their manufacture would be matters of no public health significance. But with absorbent paper containers, the sanitary conditions in the paper mills, which vary from mill to mill and from hour to hour within a single mill (R. 213), determine to a large extent the sanitary quality of the finished container.

The only absorbency problem with the glass bottle is in the paper cap, but the problem is not of comparable significance. The area of the cap is very small in comparison with that of the entire paper container (see R. 279-81). Also, there is not a single fold in the paper cap, as there is along each of the many edges of the paper container, and the paraffin is more likely to chip off on the inside edges and corners of the container than on the flat surfaces.

After hearing the witness testify, the master found:

> "a legislative body might reasonably be of the opinion that there is some danger that the walls of the finished paper container may contain bacteria, and that, by reason of the absorbency of the container walls, even when paraffined, the bacteria may get into the milk" (R. 1724).

The master continued that the amount of absorbency is unimportant, the weight to be given being for the determination of the legislative body. In support of this statement the master cited *City of Chicago* v. *Arbuckle*, 344 Ill. 597 (1931), where the court said (pp. 604-5):

> "It is argued on behalf of the plaintiff in error that if there is any question of public health connected with the distribution of the articles dealt in by it the

question is very remote; that most of the operations involved in the preparation of its products are accomplished through the use of automatic machinery; and furthermore, that teas and coffees, before consumption, are prepared with boiling water in the home and spices and flavoring extracts are used sparingly in cooking. However remote the question may be, whether it exists and the degree of its importance are for the determination of the city council, and while its determination is not final, it will not be set aside if there is any reasonable relation between the action of the council and the public health. * * *"

It is not unreasonable for the City of Chicago to require that milk be distributed in a nonabsorbent container.

3. Paraffin from paper containers gets into the milk placed in them.

The record is clear that paper containers contribute paraffin to the milk that is placed in them. As noted above, the United States Public Health Service called attention to "the sloughing off of particles of paraffin into the product" as undesirable and urged manufacturers of paper containers to provide a non-flaking surface" (plaintiff's exhibit 61, R. 1591).

Respondent's witness Tracy testified that there is a need for a waterproofing material better than paraffin because of the tendency of paraffin on the inside of the paper container to chip off and get into the milk (R. 523, 4). He also testified that he put water in paper milk containers, sent them over the usual delivery route, and then examined for paraffin. There was paraffin in every one of the containers examined (R. 518).

Petitioners' witness Martinek confirmed Dr. Tracy's testimony. Martinek, who is in charge of the chemical laboratory of the Department of Health of the City of Chi-

cago, testified as to tests conducted to determine the presence of suspended paraffin in the milk in paper containers. Every one of the 138 containers examined revealed the presence of suspended paraffin, undissolved, in quantities ranging from 1 milligram to 107 milligrams per quart (R. 1009).

The significance of the presence of undissolved paraffin in milk which is fed to infants is apparent from the testimony of Dr. Robert A. Black, a pediatrician. He said that he preferred to have milk for children not adulterated with paraffin; that in the handling of babies even the appearance of evil is to be avoided (R. 1226-27). Although respondent's witness Dr. Vaughan testified as to the harmless effect of paraffin in liquid form, he also said that *undissolved* paraffin would go through the intestinal tract "as a foreign body" (R. 1306).

The right of the city to prevent the use of containers which adulterate the milk by the addition of a foreign substance is clear, regardless of whether or not the substance added is injurious to public health. *City of St. Louis v. Schuler*, 190 Mo. 524, 89 S. W. 621 (1905), involved the validity of an ordinance which prohibited the sale of milk containing "any foreign substance of any kind whatever, or coloring matter, or any adulteration or preservative • • • for any purpose whatever." The plaintiff added formaldehyde to milk for the purpose of preventing it from souring. The ordinance was sustained against the contention that the preservative added was harmless and indeed beneficial to public health. Concerning the claim that the constitutional rights of the distributor of the milk were violated by the statute, the court said, p. 624:

> "• • • He had the right to sell pure and unadulterated milk of the standard prescribed by the ordinance and the purchaser and the consumer of milk had the

> right to purchase from him pure milk unmixed with any foreign matter added to it, and this was what the ordinance required, no more and no less, and in so doing it infringed no provision of the organic law of this state or any article of the federal Constitution."

In *Commonwealth* v. *Schaffner,* 146 Mass. 412, 16 N. E. 280 (1888), the ordinance involved prohibited the adulteration of milk by the addition of a foreign substance. The defendant added a coloring matter called "Annato," and urged the invalidity of the ordinance upon the ground that the added matter was not injurious to health. The court said, p. 282:

> "It was immaterial whether the addition of the *annato* coloring matter was, or was not, injurious to health. The addition of pure water is punishable under the statute."

By statute in Illinois the addition of *any* foreign substance to milk or cream intended for sale or exchange is an adulteration. (Ill. Rev. Stat. 1939, chap. 38, sec. 14.)

The master found (R. 1724) that the legislative body charged with the "imperative duty" (*Koy* v. *City of Chicago,* 263 Ill. 122, 130) of regulating the purity of milk might not unreasonably refuse to permit such foreign substances as paraffin in milk, especially in milk for infants.

An ordinance is not unreasonable in prohibiting the use of milk containers that add a foreign substance to the milk.

4. Odors from paraffin and bacteria in paper containers are imparted to the milk.

It is a well-known fact that milk rapidly absorbs odors to which it is exposed. The evidence shows that there are two sources of odors in paper containers.

That paraffin has an odor was established by a simple gesture on the part of respondent's witness Dr. Sanborn at the hearing before the master. On direct examination, when asked whether or not a particular paper milk container, plaintiff's exhibit 31, had been paraffined (R. 293-4), he picked up the container and smelled it once or twice. His explanation of that action appears from the following excerpt from his testimony:

> "That is a mechanical operation I go through in examining containers of any kind; when I have a specimen to look at, I usually go through a certain number of procedures such as that.
>
> Q. Why did you smell it?
>
> A. To see if I can detect any odor.
>
> Q. What would the presence or the absence of odor indicate to you, Doctor?
>
> A. By the type of odor I detect I might be able to arrive at the reason for it. * * * I didn't remember I had done it when it was mentioned because it is an automatic process to me. I do recall that I did so.
>
> The paraffin might have been overheated and on certain containers the paraffin is heated too hot and if it is heated too hot they are likely to detect certain products of decomposition due to overheating.
>
> Q. What temperature range will produce those products of decomposition?
>
> A. I can give no definite answer to that, as to the temperature that might cause it.
>
> Q. Can you give some temperatures that are certain?
>
> A. Not only the temperature but the renewal of the paraffin is a factor there. If it is renewed, there will be less chance, even at high temperatures of heating any such off color. It is accompanied by a change in color as well as odor; it is a sign of breakdown, so that the renewal of the paraffin has an effect, if the paraffin bath—
>
> Q. * * * If you recoat that paraffin, you will cover the odor?
>
> A. No.
>
> Q. What do you mean by renewal of paraffin?

A. By changing the paraffin in the bath, cleaning the tank out and putting the thing through a spraying process, and you cannot detect any possible breakdown, but if you allow it to go two or three weeks and don't change it, it becomes in that condition and—

Q. That is in addition to the temperature?

A. Yes, sir" (R. 303-4).

Thus the temperature of the paraffin bath and the length of time for which the paraffin is heated are factors involved in creating an off-odor and an off-color to the paraffin on the container.

Respondent's witness Keyser testified that oxidation of paraffin will begin at relatively low temperatures and that there will be no appreciable oxidation below the melting point of the wax (in this case about 125° F.). He also testified that the nature of the products of oxidation is acid (R. 1347-8).

Respondent's witness Peterson testified that the oxidation of paraffin gives it a rancid odor (R. 950). Although his testimony differed from Keyser's about the temperature at which paraffin oxidizes, his testimony shows that there is no way of determining for how long a period the paraffin in the bath is heated (R. 950-51). Paraffin is fed to the machine as needed and, no matter how quickly paraffin is used up in coating the containers, the paraffin put in last may be used first with the result that some paraffin may remain in the bath for long periods of time. The same paraffin may remain in the bath from day to day, because the paraffin removed from the machine at the end of the day is kept and used the next day (R. 961). According to Peterson's testimony, even a fresh paraffin bath has "a distinctive sweet paraffin odor," though "very mild" (R. 951).

Another source of odor in paraffin containers is bacteria. The witness called by the master, Dr. Rice, testified that he conducted tests with respect to a paper container which were designed to reveal the bacteria present in the container which might be transmitted to the fluid put into the container (R. 418-9). His test indicated three containers with a bacterial count of less than 1,000 colonies per container out of 23 samples, and five containers with a count of 1,000 per container. Thirteen of the containers had bacterial counts above 1,000 per container ranging up to 26,000 colonies. He described the odors emitted from the bacterial colonies contained in the paper. Those odors ran the gamut from "stale" "fishy," "musty," "wet dog," to "foul," "fecal," and "putrid" (R. 416-9).

On this issue the master found that the City Council, in prohibiting paper containers, may have taken into consideration the following: "the possibility of rancid odors from oxidized paraffin being imparted to the milk," "the so-called sweet odors of pure paraffin," and "the possibility of objectionable odors from large counts of bacteria in the paper getting into the milk" (R. 1725-26).

It is not palpably unreasonable and arbitrary to prohibit the delivery of milk in containers that impart an odor to the milk.

5. Effective sanitary control of paper containers requires supervision and control of all processes in the manufacture of paper and its conversion into containers.

The testimony of respondent's witnesses shows the necessity of inspection by health officials of all processes in the making of the paper container. Since the glass container can be effectively sterilized at the dairy when it is being filled with milk (Sanborn, R. 169), there is no need to in-

spect any aspect of the glass container before the cleaning process at the dairy. The only possible sterilizing action on the paper container at the dairy is the accidental fact that the container is immersed in hot paraffin to give it a coating. Paraffined paper milk containers are absorbent; they cannot be effectively sterilized at the dairy before they are filled with milk. As a result, effective control of the sanitary quality of paper containers requires supervision and inspection of all the many processes of manufacture and all the various materials used in making paper containers. This means that inspectors must be sent from the place of milk distribution to numerous paper mills and converting plants throughout the country.

The two methods commonly used to test the bacterial content of paper containers cannot be safely relied on by local health officers. The rinse test determines only the number of bacteria on the inside surface of the container, giving no indication of the bacterial condition of the walls of the container. The disintegration test is not reliable for several reasons. The bacterial condition of paper is not uniform. For example, paper easily acquires "slime spots" and "brownish patches" during the process of manufacture, and these small areas are likely to have a higher bacterial content than other portions of the board (R. 721, 738). While all testing is necessarily done by the sampling method, on the theory of probabilities, tests obviously became haphazard when there are likely to be great variations in the material tested (see Prucha, R. 736-9).

The unreliability of rinse and disintegration tests to indicate the sanitary conditions in the manufacture of paper containers is also shown by the testimony of respondent's witness Sanborn. He testified that rinse tests conducted to determine the bacterial condition of the finished container are apt to be misleading without knowledge and control of

the bacterial condition of the board (R. 255-6). And he testified also that while disintegration tests could be an index to the sanitary condition of manufacture in a paper mill, he did not think it advisable, from a sanitary or public health point of view, to rely alone upon disintegration tests to determine the sanitary quality of the paper board (R. 232-3).

As for the need of inspection, Dr. Sanborn testified that the sanitary condition of paper mills is dependent upon numerous factors. These factors and the sanitary condition of the paper mill and its products vary from mill to mill and within the same mill from week to week, from day to day, and from hour to hour. Determination of these factors involves inspection of the mills (R. 209-21). Dr. Sanborn also testified that it is more expensive for a paper mill to produce paper of a high sanitary quality than to produce paper of a low sanitary quality and that only economic factors prevent paper mills now engaged in making other products from producing paper board for milk containers (R. 234-42).

Respondent's witness Prucha said in his October, 1937, address to the International Association of Milk Sanitarians:

> "Milk sanitarians should inspect paper mills and check on the pulp. In the first place, the water used for diluting the pulp usually comes from polluted streams or lakes. Some paper mills have proper sanitary control over the water supply while other paper mills have not.
>
> * * * * * *
>
> "Where paper is made for milk containers some medical examination of the worker handling and packing the paper should be required. Some mills have such standards. Occasional inspection of the premises and of the bundles of the paper are desirable. The Chicago Carton Company, where the containers are

> cut and printed, was found in an excellent sanitary condition. If paper containers become extensively used, such an establishment should be visited and inspected by milk sanitarians." (Plaintiff's Exhibit 62, R. 1593-4.)

In his testimony Dr. Prucha said that some certifying agency might be set up to avoid the necessity of making visits to the mills by local health officers (R. 731), although he did not know any other instance where an inspection device of that kind had been used (R. 734). He testified unequivocally that some inspection or certification should be made (R. 733-4).

The need for control and inspection of paper mills is also shown by testimony about the need of sanitary standards in paper manufacture. Dr. Sanborn stated (R. 244-5) that in his opinion, in the interest of public health, standards governing the production of paper board for use in paper milk containers and governing the subsequent processing and handling of that paper board until the container is filled with milk should be formulated, adopted, and enforced by public health authorities. Unless inspection is to be made, the formulation of standards is obviously meaningless. Without inspection, there can be no enforcement.

It is significant that the United States Public Health Service, when amending its model ordinance to permit the use of paper containers, recommended the adoption of regulations *which require inspection of paper mills and of converting or fabrication plants.* Plaintiff's exhibit 61 contains the regulations suggested by the Health Service advisory board in June, 1939. Included were the following:

> "(5) The manufacture, packing, transportation and handling of single-service containers and container caps and covers are conducted in accordance with the following requirements. *Inspections required herein*

may be made by the health officer or by any agency authorized by him. • • •

"(c) All operations at the fabrication plant and during transportation of the manufactured articles shall be so conducted as to reduce to a minimum the possibility of contaminating the manufactured articles, as prescribed in items 13p, 14p, and 15p" (R. 1590-1).

There is no "agency authorized" by health officers to inspect paper mills and fabrication plants (Prucha, R. 734). And obviously inspection is required by health officers to see that regulations of the kind quoted are complied with. As a result, inspection of the manufacture of the container requires visits to paper mills by health officers, and inspection of the converting process requires trips to converting plants.

The unreliability of rinse and disintegration tests is indicated by the fact that *tests alone are not relied upon today* in Chicago in supervising the milk supply.

This is shown in the record. While the ordinance (sec. 3092, R. 40) requires that samples of milk be taken and tested bacteriologically, it also (sec. 3091, R. 39) requires the Board of Health to inspect dairy farms and milk plants whose milk is intended for consumption in Chicago. There are elaborate regulations of the Board of Health governing all aspects of milk production from the health of the cow to the vehicles used in making delivery to the consumer (see, for example, items 1r to 26r and items 1p to 23p, R. 45-108). The "public health reasons" noted under section 3092 state expressly that a low bacterial count "does not necessarily mean that diseased organisms are absent" (R. 41). Similarly in supervising the use of glass containers, the Board of Health does not rely alone on the rinse test or any other test. There are regulations about the cleaning and bactericidal treatment of containers (item 12p,

R. 87), including requirements for the method of sterilization, the caustic alkali content of the solution used, etc. (R. 89-90). Also inspections are made regularly ("once or twice a week, but at least every two," R. 970) of bottling establishments, including the operation of the washing equipment, the temperatures of the solutions used, etc. (R. 971-2). The rinse test is made of samples taken at various intervals approximately one month apart (R. 972). Thus, although the making of rinse tests is a standard method of supervision, this method alone is not deemed sufficient. The fact that only 1400 bottles are tested per year in Chicago does not show inadequate supervision because this is only one of the control devices used. In the regulation of milk all possible precautions are taken. Bacterial counts are not considered enough.

Similarly bacterial counts of paper containers are not considered enough. Tests should be coupled with inspection of every possible aspect of the manufacture of the container. The respondent's witness Dr. Sanborn wrote:

> "Bacteriological counts obtained thus far on various grades of paper are, however, only preliminary in that they do not adequately reveal the influence of changing mill conditions throughout the year" (R. 1513). "Without intimate knowledge and control of boards used, results of rinse tests may be inconsistent and misleading" (R. 1543).

So is explained his testimony that a disintegration test of the respondent's container gives an index of its sanitary condition (R. 266-7, 301). It may be that respondent's container was manufactured in a sanitary manner at the time of the trial. The evidence shows that it is made of virgin spruce pulp, that the water at the mill is chlorinated (the necessity for this is shown by the fact that the water contains coli bacteria, R. 513), that the paper is carefully

wrapped, that nontoxic adhesives are used, that the employees at the converting plant are examined medically, that sanitary precautions are taken during the various steps in manufacture, etc. Will the makers of this container continue these precautions and do the makers of other containers observe these precautions? This can be determined only by inspection. Periodical tests alone (even assuming that the disintegration test is as effective for paper containers as the rinse test is for glass) are no more sufficient in the case of a paper container than the rinse test in the case of glass. Inspections of the paper manufacturing operations are just as necessary as inspections of bottling equipment, the content of the alkali solution, etc.

Also, if it is assumed that paraffining has *some* bactericidal effect, the paraffining process should be inspected. Unlike respondent's container, there are types of paper containers that are not paraffined at the dairy (R. 906). Where this process takes place is not shown by the record. The paraffining process cannot be inspected and controlled by Chicago's health officers in the case of paper containers paraffined at far-distant places.

The petitioner's position on this point is completely supported by the case of *McKenna* v. *City of Galveston*, 113 S. W. 2d 606 (Court of Civil Appeals of Texas, 1938).

The plaintiff in that case sought to enjoin the enforcement of an ordinance requiring that ice cream be pasteurized and frozen upon the same premises in the city. The plaintiff bought ice cream mix in Houston where it was pasteurized, transported it to Galveston in refrigerated trucks, and used it there in the manufacture of ice cream. The plaintiff called numerous expert witnesses and the defendant city apparently called none. The trial court entered judgment

for the city and this was affirmed on appeal. There was much in the testimony about the necessity of inspection, including the following (p. 609):

> "'"• • • Pasteurization is the only method of ridding milk and milk-products from pathogenic germs that has come into general practice. As to what practical means there are for a health officer to determine whether or not milk has been properly pasteurized, the only method that can be employed for that purpose is by inspections of the apparatus used, the persons handling the milk, and the process employed at the particular plant where the pasteurization is done. • • •"'
>
> "'Dr. Stephenson testified: "Bacteria-count doesn't show whether or not the bacteria contain pathogenic-germs. As a practical matter, it is necessary in addition to taking proper samples and making bacteria-counts with reference to milk-products to take measures to see that milk is handled under proper sanitary conditions. It would not be safe simply as a health-measure to take samples of bacteria without taking other measures relating to the premises where the milk is produced, the manner, the utensils used, and the persons handling it. So, an inspection of the premises is a matter of considerable importance in insuring a safe milk supply."'
>
> "'"• • • Bacteria-count will not necessarily disclose the presence or absence of pathogenic-germs. Witness wouldn't say that it would be safe to rely upon bacteria-count, without some knowledge of the premises and handling of the product. The bacteria-count would have to be supplemented by inspection of the premises upon which the milk was produced."' '"

The court adopted in its opinion the following language from the city's brief (p. 610):

> "'• • • While some of the expert witnesses expressed the opinion that there would be no danger to the health of the city's inhabitants from ice cream frozen and pasteurized in Houston and brought to Galveston, those opinions in each instance were given

upon the assumption that the requisite care was to be taken in the pasteurizing, transporting, and handling of the product. They all agreed that each time it was handled an additional risk arose. The evidence makes clear that all possible safeguards taken in the pasteurization and handling of the ice cream mix at Houston and in its transportation to Galveston could possibly be set at naught by the manner in which it was handled by appellant after he received it. The evidence likewise makes it clear, and all the expert witnesses agree, that any practical measures relative to safeguarding milk and ice cream from infectious bacteria should include proper inspections of the premises where it is produced, handled, and pasteurized, and of all persons engaged in handling it. To make that practicable for the appellee city's health department to do, and to insure that the effects of pasteurization should not be endangered by unrestricted handling of the products after it is pasteurized, is what the ordinance plainly is designed to accomplish.'

"'That being true, it would clearly seem that the ordinance is not one of which there is a clear want of need, or that its unreasonableness so clearly appears that it can by the court be declared an arbitrary measure evidencing an abuse of discretion on the part of the governing body of the city.' "

A similar case is *Gilchrist Drug Co.* v. *City of Birmingham*, 234 Ala. 204, 174 So. 609 (1937). There the plaintiff, the operator of a drug store, sought to enjoin an ordinance requiring the manufacture of ice cream by the "pasteurized continuous flow method." The plaintiff used a new device, called a "counter freezer," for which he bought ice cream mix from Kentucky in large sealed cans; the mix was used in the counter freezer as needed. By the method required by the ordinance the mix was made in Birmingham and was required to flow immediately into the freezing apparatus after pasteurization. The mix used by the plaintiff was pasteurized in Kentucky when made, but was not pasteurized again by him. The trial court dismissed the com-

plaint and this was affirmed on appeal. The opinion (p. 610) noted that the counter freezer method for the manufacture of ice cream was a modern invention introduced into the state four or five years before. A large number were being operated in the state. The opinion noted at the same page that the ordinance in question was adopted before the counter freezer method was introduced and bears no relation to it. Of the desirability of preventive health measures, the opinion said (p. 612):

> "Rapid advance has been made in the science of medicine and, in the field of bacteriology. That the health and welfare of the people have been greatly advanced by the conscientious and intelligent labor of the scientists and members of the medical profession cannot now be open to question. Their labors are not to be restricted to curing disease and alleviating suffering, however important these may be, but the greater benefits are to be realized by the use of preventive means in anticipation of the danger of an epidemic. And it is fully as important that the health authorities should anticipate danger to public health, and provide against them, as it is to take steps to eradicate conditions after the disease has appeared."

The respondents do not contend that the methods of controlling glass containers are perfect, or that paper containers may be prohibited merely because possible methods of control fall short of perfection. The point is that the basic and essential public health techniques used in controlling glass containers cannot be applied with equal effectiveness and practicability to paper containers. Not only are the methods of testing, inspecting, and regulating different with the two containers, but the possible extent of supervision differs in that the glass container can be controlled locally while the paper container can be controlled only by making trips to distant places.

These differences in methods of control, although here they clearly justify (and indeed seem to require) the prohibition of paper containers, are in any event matters for the discretion of the legislative body. *South Carolina State Highway Department* v. *Barnwell Bros.*, 303 U. S. 177 (1936). And the case often cited by the petitioners, *Koy* v. *City of Chicago*, 263 Ill. 122 (1914), is closely applicable on this point. In that case, the ordinance required that a recording device should be attached to milk pasteurizers and that the records kept by the device should be under lock and key in the control of the commissioner of health. The plaintiff attacked the device required as impracticable and subject to manipulation by dealers and argued that the method of inspection required was not effective. After noting these contentions of the plaintiff, the opinion of the Illinois Supreme Court continued (p. 133):

> "These are questions of judgment and discretion, the determination of which must be left to the legislative department. If the apparatus should not record the temperature accurately at all times or should not indicate the length of time the temperature was maintained, or if it can be manipulated so as not to show an accurate record, these are matters for the city council to consider. *Courts cannot overrule the determination by the city council that a particular method of protecting the public health should be adopted unless it is so clearly and manifestly wrong that there can be no doubt about it.* A personal inspection of all milk sold in the city would be manifestly a requirement difficult, if not impossible, to carry out. Even though the recording apparatus may be manipulated by a dishonest dealer so as to show an untrue record, the city council may have thought its use better for the protection of the public than a system by which no record was preserved but the health officers were compelled to rely wholly upon the dealer, and we cannot say that they were clearly and unmistakably wrong. * * *" (Italics added.)

It is not unreasonable to require the use of a container whose sanitary condition may be controlled effectively by supervision at the dairy when it is filled with milk as opposed to a container which requires constant inspection of manufacture and processing in remote areas to insure effective sanitary control.

6. Paper containers are not transparent and cream does not rise to the top in them.

There are several public health aspects to the use of transparent containers. The purchaser can of course see that there are no dirty particles in the milk. But there is a more important health problem. The Chicago ordinance requires milk to have a certain butter-fat content. (See sec. 3082(A) for definition of milk, requiring milk to contain not less than 3¼% of milk-fat and sec. 3082(B) indicating that milk-fat and butter-fat are the same thing, R. 26) The requirement of a minimum butter-fat content is a health regulation, for the food value of milk depends on the proper amount of butter-fat. (See "public health reasons" under definition of milk, R. 26.) The cream line in a transparent bottle tells every purchaser its butter-fat content and every purchaser is in a sense an inspector. With this factor absent in paper containers, the city health officials will be required to make more extensive tests of the butter-fat content of the milk than they are required to do with glass containers. This factor alone would seem, under the decision in *Pacific States Box and Basket Co.* v. *White,* 296 U. S. 176 (1935), to be a sufficient justification for the exclusion of the non-transparent container. In the paper container the butter-fat content of the milk can be determined only by a "Babcock test" or by chemical analysis (R. 503-4, Tracy).

Not only is the cream line not visible in a paper container; in addition, milk in paper containers undergoes some unexplained process—chemical, physical or electrical—which so affects the milk that the cream is prevented from rising to the top of the container as it normally does in containers other than paper (R. 503-4). None of the respondent's witnesses advanced any explanation for this alteration of one of the normal characteristics of milk caused by paper containers. This strange phenomenon is alone a ground for caution in the use of a container for an easily-contaminated liquid that is a staple item in the diet of infants. This unknown factor *may* present a health problem in view of the absence of any evidence of the reason for it. The matter is thus within the discretion of the legislative body.

Koy v *City of Chicago*, 263 Ill. 122 (1914), indicates that these characteristics of paper milk containers justify their prohibition. As said in the opinion in that case (p. 131):

> "Not only may laws and ordinances require that milk offered for sale shall be pure, wholesome, and free from bacilli of any disease, but they may and do, in order to produce this result, prescribe the manner in which such purity, wholesomeness, and freedom from disease shall be secured and made to appear."

So the master found (R. 1730):

> "It may well be a legislative matter whether milk shall be sold in standard transparent glass milk bottles rather than in paper containers in order to protect the public health and to guarantee that milk sold contains the usual amount of cream."

The City of Chicago has the right to require the use of a milk container that is transparent and that does not interfere with the ordinary physical characteristics of milk.

(c) Factors relied on by the District Court and in the majority opinion of the Circuit Court of Appeals are not controlling.

The opinion of the trial court and the majority opinion of the Circuit Court of Appeals both indicated that their authors believed that other factors in the case outweighed the evidence discussed above showing possible health hazards in the use of paper milk containers. A consideration of these other factors shows that they are not controlling here.

Weakness of presumption that ordinance is valid.

The cases cited above show in clear language that whoever attacks the validity of legislation has the burden of establishing its validity and that there is a strong presumption that legislation enacted under the police power is valid. The majority opinion of the Circuit Court of Appeals says that here the presumption "could be little more than a shadow" since the use of paper milk containers was in its incipient stage when the ordinance was enacted in 1935 so that the legislative body "could not, from the nature of things, have considered and weighed their advantages and disadvantages" (R. 1794). We submit that this ruling is not sound constitutional law.

The petitioners have never taken the position in this case that the reasonableness of the ordinance must be determined as of the time of its passage in 1935, for it is admitted that a law valid when passed may become invalid thereafter by reason of a change of conditions. This

is pointed out in the opinion of the Circuit Court of Appeals (R. 1789). But certainly this does not mean that there is no presumption of the validity of legislation that is attacked on the ground that it became unreasonable after its enactment. Since the question of reasonableness is determined in the light of conditions exisiting today, we are not concerned here with what the City Council actually did consider before it enacted the ordinance, but with what it might reasonably have considered assuming conditions to have been as they are today or, rather, with what it might reasonably consider today in the light of today's conditions. For this reason the presumption of validity is just as strong as if the ordinance had been passed today or as if today's conditions existed when the ordinance was passed.

The holding of the Circuit Court of Appeals would give courts a much greater latitude in invalidating legislation which affects conditions that come into existence after its enactment. The presumption of validity arises upon the enactment of the legislation. Obviously the strength of the presumption is not impaired by advancing age.

Use of paper milk containers elsewhere.

There is much evidence in the record about the use of paper containers for distributing milk in municipalities other than Chicago. The trial judge in his opinion placed much reliance on this evidence, as well as on the absence of evidence tracing "serious disease or minor ailment" to the use of paper containers (R. 1753). Likewise the majority opinion of the Circuit Court of Appeals emphasized that the use of paper containers "has been authorized and permitted by more than 200 cities and villages in the United States, including such cities as Washington, D. C.,

New York and Philadelphia, as well as practically all of the cities and villages near and adjacent to the City of Chicago" (R. 1794).

These factors have no bearing on the validity of the Chicago ordinance under the cases cited above. At the hearing before the master the petitioners objected (R. 148) to the introduction of evidence of the use of paper milk containers in other municipalities if this evidence was to be considered on the question of the reasonableness of the ordinance. Obviously the use of the containers elsewhere has no factual bearing on the case unless accompanied by evidence that municipalities not prohibiting them considered carefully the public health hazards involved. As shown below, the slight evidence in the record about the precautions taken in a few municipalities shows that the precautions were very inadequate.

The question of the reasonableness of the ordinance must be determined by the evidence about the sanitary qualities of the paper container and not by a roll call that arrays on one side the municipalities not prohibiting its use and on the other side the municipalities prohibiting its use. Evidence of permission in one municipality or state cannot affect the validity of a prohibition in another municipality or state. The fact, for example, that Chicago may permit automobiles bearing loud speakers to tour the streets would afford no basis for an attack upon an ordinance of New York City prohibiting the use of those devices in congested areas. So the fact that other states did not limit the weight of motor trucks using their highways would not affect the validity of the Texas statute prescribing limitations of weight, *Sproles* v. *Binford*, 286 U. S. 374 (1931). The fact that Illinois has not seen fit to require compulsory vaccination could not affect the validity

of a Massachusetts statute requiring compulsory vaccination, *Jacobson* v. *Massachusetts*, 197 U. S. 11 (1904). Oregon's regulations concerning fruit containers are not invalid because they prohibit the use of containers permitted elsewhere, *Pacific States Box and Basket Co.* v. *White*, 296 U. S. 176 (1935). Instances could readily be multiplied.

Also, the ordinance may not be held unreasonable because no instance of contagion or death resulting from the use of paper containers has been proved by the petitioners. The exercise of police power for the protection of the public health is not conditioned upon the prior occurrence of disease and death. A future hazard is as strong a justification for the exercise of the power as is a prior disaster. An antecedent outbreak of amoebic dysentery, for example, is not an essential condition to the exercise of the city's power to eliminate sources of danger in plumbing systems. So, here, the city's power to protect itself from hazards to public health which it believes are inherent in the use of respondent's containers exists regardless of whether or not their use elsewhere has resulted in disaster. The respondent's witness, Packer, testified in his deposition that it was impossible to trace cases of contagion to a single-service container (R. 1374-5). As a result the lack of evidence of specific cases of illness attributable to the use of these containers is in fact of no significance.

From the testimony of the respondent's witness, Packer, it is also apparent that the consumers of milk have been used in many municipalities as experimental media for the determination of the sanitary quality of paper containers. Packer testified in substance (R. 1368-9) that regulations governing the handling of paper containers are necessary; that no regulations exist in the City of Philadelphia, although regulations were being formulated at the time of

the taking of his deposition (1939). He further testified that regulations were as necessary in 1929 when the use of paper containers was first permitted in Philadelphia as they are now, but that regulations were not then formulated because nobody knew what the regulations ought to be—"somebody had to pioneer" (R. 1370).

The principal witness for the respondent, Dr. John R. Sanborn, testified that in his opinion, in the interest of public health, standards should be formulated and adopted by public health authorities governing the production of paper board for use in paper milk containers and governing also the subsequent processing and handling of the paper board until the container is filled with milk. He further testified that he had attempted to ascertain what cities had adopted regulations with respect to paper containers and that so far as he knew no cities other than Baltimore, Maryland and Reading, Pennsylvania had adopted any regulations. In his opinion neither the Baltimore nor the Reading regulations were satisfactory (R. 244-7).

In this state of the record the fact that paper containers are used for the distribution of milk in some municipalities other than Chicago proves nothing with respect to the unreasonableness of prohibiting paper milk containers in Chicago.

Reliance upon experience elsewhere was rejected in *Standard Oil Company* v. *City of Marysville*, 279 U. S. 582 (1928), which involved an ordinance requiring the storage of gasoline below ground. The court said (p. 586):

> "The facts that the tanks of petitioners within the city limits have been operated successfully above ground; that appliances used by them are of the best type; that fires in connection with their many tanks located elsewhere have been relatively infrequent, and numerous others found by the master, were properly

for the consideration of the city council in determining whether the ordinance should be enacted, but they fall far short of withdrawing the subject from legislative determination or establishing that the decision made was arbitrary or unreasonable. * * *

"We may not test in the balances of judicial review the weight and sufficiency of the facts to sustain the conclusion of the legislative body, nor may we set aside the ordinance because compliance with it is burdensome. * * *"

Regulation of paper milk containers by the State of Illinois.

Another factor noted by the majority opinion of the Circuit Court of Appeals is that "the legislature of the State of Illinois and its Department of Health have approved the use of such containers since 1939" (R. 1794). As we have pointed out in Point I of this brief, the State of Illinois in regulating paper containers used in distributing pasteurized milk provided expressly in the 1939 statute that cities could regulate further. Also, the recognition of the use of paper milk containers by the state is merely another instance of their use elsewhere. This factor, as we have just explained, is immaterial in fact and in law.

Regulation of paper milk containers in model ordinance of United States Public Health Service.

Another element emphasized by the majority opinion of the Circuit Court of Appeals is "the fact that the United States Public Health Service, whose model ordinance has been widely adopted by cities throughout the United States, including the City of Chicago, amended its ordinance in 1939, so as to include the regulation of single-service containers" (R. 1794).

We note briefly the facts involved. The United States Public Health Service, which performs advisory functions

only as to municipal milk regulations (R. 609), has prepared a model ordinance and code of regulations, both of which the City of Chicago follows substantially (R. 1065). While this case was pending before the master, section 10 of the Health Service's model ordinance was amended to provide that milk may be delivered in single-service containers (defendants' exhibit 17, R. 980, R. 1678-79). At the time when this amendment was made, the Health Service also added provisions to its model code of regulations providing for the regulation of single-service containers.

These regulations,* as we have noted above (p. 59), require public health officials to inspect the paper mills and converting or fabrication plants in which the various processes in the manufacture of paper milk containers take place. The regulations say that the inspections may be made "by the health officer or by any agency authorized by him." The paper mills and converting plants where paper containers are made are located in various parts of the country—e. g., at the time of the trial the paper in the respondent's container was made in the West Virginia mill of the Cherry River Paper Company (R. 164) and the paper was converted into the containers by another manufacturer at Middleton, Ohio (R. 198). The inspection of the manufacturing of the respondent's container would thus require Chicago health officials to travel to West Virginia and Ohio; and there are other types of

* The Model Code of Regulations of the United States Public Health Service also contained a statement about the characteristics of paper milk containers which shows that their prohibition is not unreasonable:

> "The porous condition of paraffined containers now available and the sloughing off of particles of paraffin into the product are undesirable, and manufacturers of single-service containers are urged to make every effort to provide a non-absorbent non-flaking surface" (plaintiff's exhibit 61, R. 1591).

containers for which the paper is made and fabricated in many other states (see map, R. 1479). Also there is no "agency authorized" by health officers to inspect paper mills and fabrication plants (Prucha, R. 1734).

In contrast with the expensive devices suggested by the regulations of the Health Service for the supervision of paper milk containers, the sanitary quality of the glass containers which the Chicago ordinance requires may be supervised locally. Since the glass container can be effectively sterilized at the dairy when it is being filled with milk (Sanborn, R. 169), there is no need to inspect any aspect of the glass container before the cleaning process at the dairy. Not only are glass containers absolutely sterile when manufactured (R. 169), they receive bactericidal treatment before each use and with the best method of sterilization it is possible to obtain a sterile glass bottle "according to bacteriological tests" (R. 170). The bactericidal treatment at the local dairy can be thoroughly inspected and controlled locally. In Chicago this control consists of regular inspections of the cleaning process, including the operation of the washing equipment, the temperatures of the solutions used, the bottling equipment, etc. (R. 970-72). Also occasional tests are made locally of the bacterial content of sample bottles (R. 972).

Instead of permitting the use of paper milk containers, the proper regulation of which requires inspection of manufacturing processes at far-distant places, the Chicago City Council requires the use of glass containers which may be (and are) inspected locally. This is not an unreasonable legislative determination, even though the model ordinance of the United States Public Health Service permits both glass and paper milk containers.

Use of paper containers for other purposes.

In holding that the ordinance was void if it forbade the use of paper milk containers, the trial judge placed great reliance on evidence about other uses of paper containers in Chicago (opinion, R. 1752). Of one type of container, the opinion states that it is less meritorious in structure and design than respondent's and is in daily use in Chicago for the sale of milk, chocolate milk, ice cream, and other liquids by drug stores, hotels, restaurants, and soda fountains.* The other type, the opinion says, is in common use for cheese, butter, meat, drinks, and other edibles.

The record shows that the use of paper containers for purposes other than the delivery of fresh milk does not make the prohibition of the use of paper milk containers unreasonable or discriminatory. The petitioners introduced evidence showing that the characteristics of the other commodities sold in paper containers are such that from a public health point of view they are in nowise comparable to milk (R. 1094-95, R. 1171-73). This fact is also established in the record by the statement of the respondent's leading witness, Dr. John R. Sanborn:

> ". . . *milk is the most perishable and easily contaminated food that is placed in paper containers* . . ." (R. 1495).

---

*The trial court did not point out that the sale in paper containers of such of these commodities as are milk products is forbidden by the Chicago Board of Health. The only evidence of the sale of milk in paper containers was testimony that attorneys employed by the respondent went to several drug stores and restaurants in Chicago and purchased milk in paper tumblers (R. 857-62, 891, 897). The clerks in these stores were violating a regulation of the Board of Health providing, "All milk and milk products shall be sold, served, or dispensed to the final consumer only in unopened, original containers as received from the distributor" (defendants' exhibit 26, R. 1697). Obviously a violation of this regulation does not show that there are no health hazards in the use of paper milk containers. The master so indicated in his report (R. 1731).

Proposal by Chicago Board of Health that City Council permit use of paper milk containers.

The majority opinion of the Circuit Court of Appeals emphasizes the fact that the Chicago Board of Health recommended to the Chicago City Council that the ordinance be changed in accordance with the amendment to the model ordinance of the United States Public Health Service. The proposal was made on October 16, 1939 while this case was being heard by the master. In making its recommendation for the change in the ordinance, the Chicago Board of Health also recommended that the regulations of the United States Public Health Service be adopted (R. 1698-99). As we have noted, the regulations of the Health Service require health officials to inspect paper milk containers while in the process of manufacture and this inspection must be made in far-distant places. Clearly it is not unreasonable on the part of the Chicago City Council to disregard the recommendation of the Board of Health that paper milk containers be permitted when the regulation of the recommended containers would require local health officers to make expensive inspection trips to the paper mills and converting plants.

* * * * * *

We submit that the factors considered by the trial court and the majority of the judges of the Circuit Court of Appeals to prove the ordinance to be unreasonable are not determinative of the question of the validity of the ordinance under the fourteenth ammendment. Unless the wisdom and propriety of the ordinance are to be determined by the courts, the controlling factor is what was admitted in the majority opinion of the Circuit Court of Appeals: "the record discloses some evidence . . . that the use of such containers presents a hazard to health" (R. 1794).

The prohibition of the use of paper milk containers may be held unreasonable only if it is "so unrelated in any way to any possible danger to public health that the enactment must be considered as a merely arbitrary interference with the property and liberty of the citizens" [*People* v. *Quality Provision Co.*, 367 Ill. 610, 614 (1938), quoting from Mr. Justice Hughes in *Price* v. *Illinois*, 238 U. S. 446, 451-452 (1915)]. The evidence shows that the ordinance is not unreasonable. The holding of the trial court and the pronouncement of the Circuit Court of Appeals that the ordinance is unreasonable were based on an erroneous conception of the applicable principles of constitutional law.

CONCLUSION.

The petitioners respectfully urge this court to reverse the judgment of the Circuit Court of Appeals.

CITY OF CHICAGO, *a Municipal Corporation*,
BOARD OF HEALTH OF THE CITY OF CHICAGO,
DR. ROBERT A. BLACK, *Health Commissioner and Acting President of Board of Health of the City of Chicago*,

Petitioners,

BY BARNET HODES,
Corporation Counsel of the City of Chicago,
511 City Hall, Chicago, Illinois,
Attorney for Petitioners.

Of Counsel.

APPENDIX A.

ILLINOIS MILK PASTEURIZATION PLANT LAW.

Enacted by the 61st General Assembly,

Approved July 24, 1939.

(Laws of Illinois, 1939, pp. 660-666; Ill. Rev. Stat., 1941, Chap. 56½, Secs. 115-134.)

AN ACT *regulating the handling, processing, labeling, sale and distribution of pasteurized milk and pasteurized milk products.*

SECTION 1. The words and phrases herein defined are used in the sense given them in the following definitions:

(a) The terms "pasteurization," "pasteurized" and similar terms shall be taken to refer to (1) the process of heating every particle of milk or milk products to at least 143° F., and holding at such temperature for at least 30 minutes; or (2) heating every particle of milk to at least 160° F., and holding at such temperature for at least 15 seconds; either method shall be carried out in apparatus approved by the Department and properly operated; provided that nothing in this definition shall be considered as disbarring any other process which has been demonstrated to be equally efficient and is approved by the Department.

(b) "Department" means the State Department of Public Health.

(c) "Director" means the Director of the Department of Public Health.

(d) "Person" includes an individual, aggregation of individuals, corporation, association and partnership.

(e) "Certificate of Approval" or "Certificate" means a document awarded to the owner or operator of a pasteurization plant for compliance with the provisions of and under conditions set forth in this Act.

(f). "Pasteurized Milk Products" means and includes pasteurized cream, Vitamin "D" milk, soft curd milk,

homogenized milk, skimmed milk, buttermilk and milk beverages as defined in this Act.

1. Pasteurized cream is a portion of milk which contains not less than eighteen per cent milk fat.

2. Pasteurized Vitamin D milk is milk the Vitamin D content of which has been increased by a method and in an amount approved by the Director.

3. Pasteurized soft curd milk is milk the curd tension of which is comparable to human milk when tested by and in a manner approved by the Director.

4. Pasteurized homogenized milk is milk that has been mechanically treated in such manner as to alter its physical properties with particular reference to the condition and appearance of the fat globules, to such an extent that no visible cream separation occurs after 48 hours storage and fat tests of the milk at the top and bottom of a quart bottle do not show a difference in fat percentage exceeding two-tenths of one per cent (0.2%).

5. Pasteurized skimmed milk is milk from which a sufficient portion of milk fat has been removed to reduce its milk fat percentage to less than three per cent.

6. Buttermilk is the product resulting from the churning of pasteurized milk or cream, or from the souring or treatment by a lactic acid or other culture of milk, skimmed milk or reconstituted milk. It contains not less than eight per cent of milk solids-not-fat.

7. Pasteurized milk beverages shall mean a food compound consisting of milk, skimmed milk, cream or buttermilk as the case may be, to which has been added a syrup or flavor consisting of wholesome ingredients.

(g) "Pasteurization Plant" as used herein shall be taken to include the building, machinery, apparatus, and other equipment and appurtenances necessary and essential in the work of pasteurizing milk or milk products, tanks and other equipment essential to the storing or handling of the milk being held for pasteurization, the equipment, machinery, apparatus, and appurtenances for cooling the milk and milk products, and placing the milk and milk products in bottles or other suitable containers, and storing such bottles and containers following pasteurization.

(h) "Minimum Requirements" means the code formulated by the Director for interpretation and enforcement of this Act.

SECTION 2. Any person operating a pasteurization plant who distributes, delivers or sells pasteurized milk or pasteurized milk products for consumption in the State of Illinois shall annually make application to the Department for a Certificate of Approval.

SECTION 3. Any person who shall hereafter engage in operating a pasteurization plant for the purpose of distributing, delivering, or selling pasteurized milk or pasteurized milk products for consumption in the State of Illinois, shall before engaging in such business make application to the Department for a Certificate of Approval.

SECTION 4. Upon receipt of such application, the Department shall make an inspection of said pasteurization plant and in the event that the plant, equipment and methods of operation are found to comply with the provisions of this Act, the Director shall issue a Certificate of Approval upon payment of the required fee as herein provided.

SECTION 5. Any person contemplating the construction or remodeling of a pasteurization plant for which a Certificate of Approval is required by this Act shall submit plans, specifications and information relative thereto to the Department for review. The Director shall review such plans, specifications and information and shall advise in writing whether or not such proposed construction or remodeling complies with the requirements of this Act.

SECTION 6. Any person, operating a pasteurization plant or having made application for a Certificate of Approval for the operation of a pasteurization plant shall at any time allow the Department to inspect such plant and to take such samples as may be deemed necessary by said Department.

SECTION 7. All bottles, cans, packages and other containers enclosing milk or any milk product defined in this Act shall be plainly labeled or marked with (a) the name of the contents as given in the definitions in this Act; (b) the word "pasteurized" only in the event the contents have been pasteurized or heated within the scope of this Act; (c) the name and post office address of the plant in which the contents were pasteurized.

SECTION 8. All pasteurized milk and milk products shall be placed in their final delivery containers in the plant in which they are pasteurized. It shall be unlawful for hotels, soda fountains, restaurants, grocery stores, milk depots, milk stations and similar establishments to sell or serve any pasteurized milk or milk products except in the original container in which it was placed at the point of pasteurization, provided that this requirement shall not apply to milk or milk products consumed on the premises which may be served from the original container or from a dispenser approved by the Department for such service. The sale or distribution of bulk, loose or dipped pasteurized milk or milk which has been heated within the purview of this Act is hereby prohibited.

SECTION 9. Any person selling, delivering or distributing milk or milk products in the State of Illinois who shall heat milk or milk products or subject milk or milk products to other treatment in an effort to make the milk or milk products safe for human consumption or to preserve its keeping qualities shall comply with the provisions of this Act.

SECTION 10. No person shall sell, deliver or distribute any milk or milk products which have been heated or subjected to any other treatment in an effort to make the milk or milk products safe for human consumption or to preserve its keeping qualities unless such milk or milk products have been heated or treated in compliance with the provisions of this Act.

SECTION 11. No milk or milk products sold, distributed or delivered in this State shall be heated or subjected to any other treatment in an effort to make it safe for human consumption or to preserve its keeping qualities unless such milk or milk products are processed in compliance with the provisions of this Act.

SECTION 12. No person selling, delivering or distributing milk or milk products shall sell or offer for sale milk or milk products with any word or words stating or indicating that the milk or milk products are pasteurized nor shall they indicate by any other means that the milk or milk products were pasteurized, until the Department has issued a Certificate of Approval for the pasteurization plant in which the milk or milk products were pasteurized.

SECTION 13. The sale or distribution of milk from a plant, the Certificate of Approval of which has been revoked is hereby prohibited.

SECTION 14. The Certificate of Approval fee shall be ten dollars ($10.00). Unless suspended or revoked by the Department, a certificate shall be good until January first of the year following the date of its issue, and subject to annual renewal upon payment of renewal fee of ten dollars ($10.00). Such renewal being subject to approval on reinspection or on information submitted by the owner or operator of a plant in answer to questions sent to the owner or operator by the Department, or both.

SECTION 15. Any pasteurization plant coming under the provisions of this Act shall conform with all of the following items of construction, equipment, maintenance and operation and in accordance with minimum requirements adopted by the Director for interpretation and enforcement of this Act.

ITEM 1. The floors of all rooms in which milk or milk products are handled or stored shall be constructed of concrete or other equally inpervious and easily cleaned material and shall be smooth, properly drained, provided with trapped drains, and kept clean.

ITEM 2. Walls and ceilings of rooms in which milk or milk products are handled or stored shall have a smooth, washable, light-colored surface and be kept clean. Ceilings shall have a minimum height of ten (10) feet.

ITEM 3. All openings into the outer air shall be effectively screened to prevent the access of flies. Doors shall be self-closing.

ITEM 4. All rooms shall be well lighted and ventilated.

ITEM 5. The various milk-plant operations shall be so located and conducted as to prevent any contamination of the milk or of the cleaned equipment. Pasteurized milk or pasteurized milk products shall not be permitted to come in contact with equipment with which unpasteurized milk or milk products have been in contact.

ITEM 6. Every milk plant shall be provided with toilet facilities. There shall be at least one room or vestibule not used for milk purposes between the toilet room and any

room in which milk or milk products, equipment of containers are handled or stored.

ITEM 7. The water supply shall be easily accessible, adequate and of a safe, sanitary quality.

ITEM 8. Convenient hand-washing facilities shall be provided, including warm running water, soap and sanitary towels.

ITEM 9. Only "sanitary milk piping" of a type which can be easily cleaned with a brush shall be used.

ITEM 10. All multi-use containers and equipment with which milk or milk products come in contact shall be constructed in such manner as to be easily cleaned and shall be kept in good repair. Single service containers, caps, gaskets and similar articles shall be manufactured and transported in a sanitary manner.

ITEM 11. All wastes shall be disposed of in conformity with the requirements of the Department.

ITEM 12. All milk and milk products containers and equipment shall be thoroughly cleaned after each usage. All multi-use containers shall be subjected to an approved bactericidal process after each cleaning and all equipment immediately before each usage. When empty and before being returned to a producer by a milk plant, each container shall be effectively cleaned and subjected to bactericidal treatment.

ITEM 13. After bactericidal treatment, all bottles, cans, and other milk or milk products containers shall be stored in such manner as to be protected from contamination.

ITEM 14. Between bactericidal treatment and usage, containers and apparatus shall not be handled in such manner as to permit any part of the person or clothing to come in contact with any surface with which milk or milk products come in contact.

ITEM 15. Milk bottle caps and parchment paper for milk cans shall be purchased and stored only in sanitary tubes and cartons respectively, and shall be kept therein until used.

ITEM 16. Pasteurization shall be performed as described in Section 1 of this Act. All pasteurizers shall be equipped with such temperature indicating and recording instru-

ments and such accessory equipment as may be specified in the minimum requirements.

ITEM 17. All milk received for pasteurization but not pasteurized within two hours after it is received at the plant shall then be immediately cooled in equipment approved by the Department to a temperature of 50° F., or less, and maintained thereat until pasteurized; and all pasteurized milk and milk products shall be immediately cooled to an average temperature of 50°F., or less and maintained thereat until delivery.

ITEM 18. Bottling or packaging of milk and milk products shall be done at the place of pasteurization by approved mechanical equipment.

ITEM 19. Overflow milk or milk products shall not be sold for human consumption.

ITEM 20. Capping of milk and milk products shall be done by automatic machinery approved by the Department. Hand capping is prohibited.

ITEM 21. Every person connected with a pasteurization plant whose work brings him in contact with the production, handling, storage, or transportation of milk, milk products, containers or equipment, shall furnish such information, permit such physical examinations, and submit such laboratory specimens as the Department may require for the purpose of determining freedom from infection.

ITEM 22. All persons coming in contact with milk, milk products, containers, or equipment shall wear clean outer garments and shall keep their hands clean at all times while thus engaged.

ITEM 23. All vehicles used for the transportation of pasteurized milk or milk products shall be so constructed and operated as to protect the milk or milk products from the sun and from contamination. Such vehicles shall be kept clean. The immediate surroundings of the milk plant shall be kept in a neat, clean, condition.

SECTION 16. The Department may either refuse to issue, or may refuse to renew, or may suspend, or may revoke any Certificate of Approval because of the violation of any of the provisions of this Act or for any of the following causes:

(a) Insanitary conditions of plant surroundings within the control of the plant management, insanitary methods

of handling milk, milk products or milk containers or equipment.

(b) Employment of careless, indifferent and inefficient personnel.

(c) Violation of any of the provisions of this Act or of the minimum requirements for interpretation and enforcement of the Act.

(d) Failure to display Certificate of Approval to the public at all times when such Certificate of Approval has been issued as provided in this Act.

(e) Displaying to the public any Certificate of Approval which has been suspended or revoked or which has expired.

The Department shall, before refusing to issue, suspending or revoking any Certificate, at least ten (10) days prior to date set for hearing, notify in writing the applicant or holder of such certificate of any charges made and shall afford such accused person an opportunity to be heard in person or by counsel in reference thereto. Such written notice may be served by delivery of the same personally to the accused person, or by registered mail to the place of business of the accused last theretofore known to the Department. At the time and place fixed in the notice, the Department shall proceed to hearing of the charges and the accused shall be accorded ample opportunity to present in person or by counsel, such statements, testimony, evidence and argument as may be pertinent to the charges or to any defense thereto.

At any time after suspension or revocation of any Certificate, the Department may restore it to the accused if the Department is satisfied that the accused will comply with the provisions of the Act.

SECTION 17. Any order or decision made, issued or executed by the director in connection with the refusal to issue or renew, suspension or revocation of a Certificate of Approval whereby any person or company deems himself or it to be aggrieved, shall be subject to review by the Circuit Court of Sangamon County. A petition for the review of the action of the Director objected to by such person or company shall be filed within thirty (30) days from the date of the service of a copy of the order or decision made by the Director upon such person or company. A copy of such petition for review as filed with and certi-

fied to by the clerk of such court shall be served upon the director within five (5) days after filing thereof. If such petition for review is not filed within said thirty (30) days the parties aggrieved shall be deemed to have waived the right to have the order or decision reviewed.

The Director shall within ten (10) days, unless the time be extended by order of court, after the service of the copy of the petition for review upon him, prepare and file with the clerk of said court a complete transcript of the record of the hearing, if any had before him, and a true copy of the order or decision, and certify to the same. The order or decision of the director shall be deemed *prima facie* to be correct and the cause shall be heard by the court as a civil case upon such transcript of the record. Merely technical irregularities in the procedure of the Director shall be disregarded and the burden of proof of questions in controversy shall rest upon the petitioner.

The said court shall have jurisdiction to affirm or set aside the order or decision of the director and to restrain the enforcement thereof.

Appeals from all final orders and judgments entered by the said court in reviewing the order and decision of Director may be taken by any party to the action as in other civil cases.

The commencement of proceedings to review the action of the Director under the provisions of this section shall not act as a stay of the Director's order or decision unless so ordered by the court upon due notice to the director.

SECTION 18. Any person violating any of the provisions of this Act shall be guilty of a misdemeanor and on conviction thereof shall be punished by a fine of not more than one hundred dollars ($100.00) for each day such violation continues or imprisonment in the county jail for not more than one year or both such fine and imprisonment.

SECTION 19. Nothing in this Act shall impair or abridge the power of any city, village or incorporated town to regulate the handling, processing, labeling, sale or distribution of pasteurized milk and pasteurized milk products, provided that such regulation not permit any person to violate any of the provisions of this Act.

SECTION 20. The Act entitled "An Act in relation to the pasteurization of milk", approved June 30, 1925, as amended June 29, 1935, is hereby repealed.

APPENDIX B.

Glossary of Technical Terms Frequently Used in Record.

B-coli, coli bacteria, see *coli*.

B-prodigiosus, prodigiosus bacteria, see *prodigiosus*.

broke, paper that has broken in manufacture at the mill and is put through the process again (R. 202, 7; 1068).

calender, the machine in a paper mill in which the paper is sprinkled with water and ironed to give it a smooth finish (R. 744, 1073).

chip, mixed waste papers from which paper is made (R. 202, 1069).

chloramine (sometimes misspelled *chlorarine* in the record), a germicide made of chlorine and ammonia used in paper mills (R. 218).

coli, a type of intestinal bacteria indicating faecal contamination (R. 383, 715).

disintegration test, pieces of paper board are cut and placed in sterile water, the paper is then beaten by a disintegrating machine, such as the apparatus in the photograph, R. 1523, and the water with the pulp suspended in it is then tested for its bacterial content (R. 175, 1537); designed to disclose the presence of bacteria in the paper board (R. 266).

offset, an impression made on the back of a sheet of paper by the printing on the sheet piled on top (R. 344).

pathogenic bacteria, disease-producing bacteria (R. 182).

prime stock, pulp made directly from wood (R. 199).

prodigiosus, a type of bacteria used often in bacterial tests because they form red colonies and can be detected without much technical difficulty (R. 1202).

rinse test, sterile water is introduced into a container and the walls of the container are rinsed with the water; the rinse water is taken out and the bacteria

counted (R. 186); the standard method for testing glass milk bottles (R. 486); designed to disclose the presence of surface bacteria (R. 265).

secondary stock, pulp or paper that is not prime; sometimes used to mean waste papers (R. 201).

scoring, in a converting plant the process of denting the portions of the paper to be bent when the container is formed (R. 313).

slime spot, a spot on paper caused by slime in the water or machinery at a paper mill (R. 215-7).

spore (sometimes misspelled *spoor* in the record), a seed that becomes bacteria, a dormant stage of bacteria (R. 285, 740).

trim, the cuttings left over after the fabrication of a paper product (R. 202, 1069).

virgin stock or pulp, pulp that has not previously been used for commercial purposes (R. 207).

waste papers, paper collected from offices, homes, etc., to be re-used by a mill in making fresh paper (R. 200).

white water, water in a paper mill that has been through the process and is re-used (R. 219).

APPENDIX C.

Summary of Testimony of Expert Witnesses.

(Within the confines of this brief it is impossible to give a complete account of the testimony of the expert witnesses, to state every opinion expressed, and to explain every experiment testified to. The following brief resumé of the more important expert testimony is therefore in the nature of a guide to the record.)

John R. Sanborn of Geneva, New York (testimony R. 144-305), plaintiff's witness, is a bacteriologist; graduate of Massachusetts State College, Doctor of Science and Philosophy; teacher of bacteriology at McGill University (1924-1928); research bacteriologist for International Paper Company (1929-1933) and Arthur D. Little, Inc. (1934-1936) investigating paper containers and wrappers for food; since February, 1937, in charge of investigation of paper containers at New York State Experiment Station, Geneva, New York, in employ of Cornell University (R. 144-6)—the fund for the investigation having been started by paper container manufacturers, including the Ex-Cell-O Corporation, the manufacturer of the machine that forms and fills respondent's container (R. 224-225); author of numerous articles, of which a number appear in the record (plaintiff's exhibit 4, R. 1401-14; plaintiff's exhibits 16, 17, 49, 21, 22; defendants' exhibit 2).

Dr. Sanborn testified about various aspects of paper milk containers, including the operation of paper mills (R. 164-6), sanitary factors in paper manufacture (R. 198-221), and tests made by him on paper and glass containers. In his personal experience he knew of no disease spread by single-service milk containers (R. 153-4) and there is a

higher degree of sterility in the paper container than in the glass bottle (R. 171); he stated that it was possible to obtain a sterile glass bottle with the best method of sterilization (R. 170). In his opinion, the absorption of milk he had found in paper containers was not detrimental to health or to the consumers of milk (R. 289-90) and he had not heard any objection from health officials about the amount of absorption (R. 286). In his opinion the paraffin in paper containers is not detrimental to the milk (R. 178) or dangerous to health (R. 295), and the first purpose of paraffin is to prevent leakage and a secondary purpose to act as a sterilizing agent, for which it is not effective (R. 194). In his opinion city health authorities where paper milk containers are permitted should have some method of supervision of sanitary conditions in paper mills (R. 209). In his opinion a disintegration test on respondent's container would give an index of the sanitary condition of the board and the sterility of the container (R. 266-7), and as long as the mill making respondent's container goes on as it has or unless some emergency arises, inspection of the mill is not necessary (R. 301). In his opinion it is "very often true" that some effort in addition to the disintegration test is necessary (R. 301).

Harry C. Fisher of Cincinnati (testimony R. 306-359, 534-546), respondent's witness, is a chemist, graduate of the University of Cincinnati; chief chemist of Gardner-Richardson Company. He testified about the processes in converting paper sheets into paper blank containers for milk (R. 307-16, 327-29, 332-38, 534-40) and to disintegration tests made by him on paper board (plaintiff's exhibit 39, R. 319-25, 1561-2). On cross-examination, he described spots on defendants' physical exhibits 3 (R. 332-43) and 4, 5, and 6 (R. 344-47, 352-54) and on plaintiff's physical exhibit 40 (R. 346-7, all of which are unparaffined blank con-

tainer forms. He described little particles of fibres and slivers at the edges of the blanks (R. 340-41, 356). He tore a blank to show that the ink spots did not go below the surface of the paper board (R. 355).

John W. Rice of Lewisburg, Pennsylvania (testimony, R. 378-440), a witness called by the master (R. 378), is a professor of bacteriology at Bucknell University; received a doctor's degree from Columbia University; has done research work on paper containers since 1931 (R. 378-9). He testified about two series of tests made by him as reported in two articles, one in 1934 on glass and paper containers, and one in 1937 on paper containers (R. 383 ff., 398-411, 414-32). In his opinion the principal sources of bacterial contamination of paper milk containers are the pulp and the water used in paper manufacture (R. 380). In his opinion paper containers have been produced "which compare very favorably with sterile glass bottles as a sanitary receptacle for milk" (R. 388). In his opinion paper milk containers are superior to the glass container because there is no chance to spread infectious disease organisms from household to household by a single-service container (R. 424). As a bacteriologist he was not satisfied with the present development of paper or glass milk containers (R. 385-6). His 1937 studies indicated that the inner or milk-contact surfaces of some paper containers tested were 93.9 per cent sterile (R. 396). In his opinion, if the paper board is free from bacteria, there is no health problem presented in the absorption of milk in a paper container (R. 412). His 1937 studies showed bacterial odors in the paper containers tested (R. 416-19).

Paul H. Tracy of Urbana, Illinois (testimony, R. 471-533), respondent's witness, is Professor of Dairy Manufacture at University of Illinois, graduate of University of Illinois with degrees of B.S., M.S., Ph.D.; has done research

work and published many articles on dairy products; in February, 1937, started studies of paper milk containers with Dr. Prucha; has visited paper mills (R. 471-3), his expenses being paid by the mills (R. 525); has done special work for respondent (R. 525). Dr. Tracy's department operates a dairy for retail customers to make teaching more practical, using three types of paper containers as well as glass bottles (R. 473-4), the Pure-Pak machine used having been transported and lent by the Ex-Cell-O Corporation (R. 526). Dr. Tracy testified to many tests performed by him on many aspects of paper milk containers and glass milk bottles (R. 493-8; plaintiff's exhibit 44, R. 494, 1565). In his experience he had not traced any disease to paraffin particles in milk in paper containers (R. 503). In his opinion the condition of the paper mills is a significant factor in the sanitary condition of the paper container (R. 512). He would not consider the chipping of paraffin in the milk or the bulging of the paper container to present a health problem (R. 529-30), nor the absorption of milk in the wall of the container (R. 531).

Howard Orvis (testimony, R. 567-606) of Winnetka, Illinois, respondent's witness, had been health officer for the Township of New Trier for twelve years when he testified (R. 567, 572). He testified to bacterial counts taken by rinse tests on milk in Pure-Pak containers from one dairy and on milk in glass containers from another dairy. He felt that the control he had over paper containers was equal to the control over glass bottles (R. 569-73). He was never in a paper mill (R. 573), and in his ten months' experience with paper milk containers had no occasion to think that it was necessary to go to the paper mill to guard the public health of Winnetka (R. 605).

Martin J. Prucha of Urbana, Illinois (testimony, R. 624-671, 700-839), respondent's witness, is a Professor at Uni-

versity of Illinois; Ph.D., Cornell, 1913; since 1920 was chief in research in the Illinois Agricultural Experimental Station, has done work for the Chicago Board of Health (R. 625-6); worked with Dr. Tracy at University of Illinois on study of paper containers (R. 627); author of many articles on milk products and milk control, of which two are in the record as plaintiff's exhibits 62 and 63. Many tests made on various aspects of paper milk containers were described by Dr. Prucha and the results appear in charts in the record (plaintiff's exhibits 46 to 60, R. 1572-88; testimony, R. 632-70, 700-16, 755-70, 788-90, 795, 804-5, 823-36). In visiting the paper mill at which respondent's container is made (R. 628), Dr. Prucha found the paper "practically sterile" and the sanitary methods used satisfactory (R. 630-1). In his experience there was a tendency for glass bottle-filling equipment to have more bacterial contamination than the machine for filling Pure-Pak containers (R. 655). In his opinion the Pure-Pak machine protects the unfilled containers "exceptionally well" (R. 659), the bacterial counts obtained in his tests of Pure-Pak containers are "very low" (R. 660), and the containers are sanitary (R. 661). In his opinion the bacteria that he found in adhesive in the containers (five per container) did not present a health problem (R. 710). In examining a Detroit paper mill, he found coli germs in the calender stacks, and after its treatment there the paper is not sterilized (R. 742-3). In his opinion the sanitary quality of that water was of sanitary significance (R. 743-4).

M. J. Woodman of Evanston, Illinois (testimony, R. 672-688), respondent's witness, is in charge of food and milk supply in the health department of Evanston, Illinois. He described rinse tests made in Evanston on respondent's container (R. 673-4). The Evanston Board of Health does not conduct disintegration tests (R. 682-3). He did not con-

sider it necessary to examine paper mills or fabricating plants (R. 675), and had not been to converting plants (R. 681) and did not know the temperature of the paraffin bath at respondent's Chemung plant (R. 685).

Fred O. Tonney of Chicago (testimony, R. 898-938), respondent's witness, bacteriologist and physician, graduate of University of Chicago; was connected with Chicago Board of Health from 1909 to 1937, when he was "executive officer" (R. 899), an office that was abolished in 1937, and the witness thereafter filed suit against the Board of Health (R. 936); was present at hearings of this case to advise respondent's counsel (R. 1001). He described visits made by him the week before he testified and arranged by respondent's counsel) to respondent's plant, to another plant packaging milk in paper containers, and to another plant packaging milk in glass containers (R. 902-06). He had not ever visited a paper mill making paper for milk containers (R. 921) or a converting plant (R. 922). In his opinion the rinse test was equally applicable to glass and paper containers and inspection of paper mills was an "unnecessary refinement" (R. 913). In his opinion the Pure-Pak container represents a distinct advance in the sanitary sale of milk (R. 910-11).

Howard R. Peterson of Chicago (testimony, R. 942-959, 966-67), respondent's witness, engineer at Standard Oil Company, which makes paraffin wax, graduate of University of Nebraska; did post-graduate work in chemical engineering at University of Chicago (R. 942-3). He described the paraffin used in the Pure-Pak machine for coating paper milk containers (R. 944), and tests made by him on the machine in 1939 as to the paraffin used (R. 944-8). In his opinion paraffin does not oxidize in the operation of the Pure-Pak machine (R. 953).

Paul V. Keyser of New York City (testimony taken by deposition, R. 1334-53), respondent's witness, is chemical engineer at Socony Vacuum Oil Company, Inc., graduate of Massachusetts Institute of Technology. He described the process of manufacturing paraffin, its chemistry, its qualities, its uses in coating paper containers, etc. (R. 1336-45). In his opinion a properly paraffin paper container would be satisfactory from the standpoint of absorption for a period of from one to two weeks (R. 1350-52).

Herbert M. Packer of Philadelphia (testimony taken by deposition R. 1355-76) respondent's witness, is a civil engineer, graduate of University of Pennsylvania, chief of housing and sanitation division of Philadelphia Department of Public Health since 1925 (R. 1355-6). He testified about the use of paper milk containers in Philadelphia (R. 1359-61, 1371-74). From a public health standpoint he preferred paper to glass containers (R. 1361-63). There were no regulations in Philadelphia about paper containers but there were about glass containers and he thought there should be regulations about paper containers (R. 1368-69).

A. E. Carpenter of Philadelphia (testimony taken by deposition, R. 1385-96), respondent's witness, is an employee of Sylvan Seal Milk, Inc., with milk plants in Philadelphia and Baltimore distributing milk in Pure-Pak containers (R. 1386-7). He described the extent of the sales made by his company and identified letters received by the company from public health officers of various cities commending the use of the containers (letters, plaintiff's exhibits 5-11, R. 1471-74). The petitioners objected to the admission of the letters on the ground that they were hearsay (R. 1709).

R. T. Vaughn of Chicago (testimony, R. 1302-06), respondent's witness, attending surgeon at Cook County Hospital, testified that mineral oil and paraffin are derived

from the same source (R. 1302) and that paraffin is used in surgery to fill bone cavities and as dressings for wounds (R. 1303-05).

William D. McNally of Chicago (testimony, R. 1251-1301), respondent's witness, physician and toxicologist, graduate of University of Michigan (A.B.) and University of Chicago (M.D.), toxicologist to coroner of Cook County for seventeen years, author of books and many articles (R. 1251-2). In his opinion there was no public health hazard presented by the lead in the ink "offset" on the inside of a paper milk container (R. 1253-62, 1277-89) or by the paraffin that gets in the milk from the container (R. 1262-66). In his opinion the paraffin on paper milk containers prevents bacteria in the container from getting into the milk, unless there was a break in the paraffin (R. 1267).

Lloyd Arnold of Chicago (testimony when called by respondent, R. 610-12; when called by petitioners, R. 1061-1204), since 1927 professor in charge of department of bacteriology and public health at University of Illinois College of Medicine, graduate of Vanderbilt University (M.D.), attended Universities of London, Oxford, Goettingen, Munich; member of Chicago Board of Health (one of defendants) since December, 1938, and since then has done administrative and consulting work for the Board, for which he receives compensation (R. 1064-5); attended all hearings in this case, including taking of deposition (R. 1106), and consulted with petitioners' counsel (R. 1109); has done research and consulting work on soap for Proctor & Gamble Company (R. 1107), on paper for Kimberly-Clark Corporation since 1928 (R. 1101), on paper containers for Ex-Cell-O Corporation during October to December, 1937 (R. 1096-1101) and for Sealrite Company during June to December, 1938 (R. 1102-03).

In his direct examination (R. 1061-1104) Dr. Arnold set forth what he considered the public health problems in

paper mills (R. 1067-75), in converting plants (R. 1075-80), and in paraffining plants (R. 1080-82); he described tests made by him on the absorption of paper containers (R. 1083-85); he stated his opinion of the accuracy of rinse and disintegration tests of paper milk containers (R. 1087-89), of the public health hazards of paraffin in the milk in paper containers (R. 1090-91), of the relative health problems in the use of paper milk containers and paper caps on glass containers (R. 1092-93), of the relative hazards in the use of paper containers for milk and for ice cream, coffee, butter, etc. (R. 1093-95). He described what caused him to change his opinion of paper milk containers as set forth in his report (plaintiff's exhibit 4) made to Dr. Bundesen of the Chicago Board of Health on December 4, 1937 (R. 1102-04). Throughout his testimony he stated his opinion to be that there were public health hazards in the various materials used in paper containers and in the various processes in the making of the containers.

The lengthy cross-examination of Dr. Arnold covers almost a hundred pages in the record (R. 1106-1201), and he was called as a witness by respondents to identify his report of December 4, 1937 (plaintiff's exhibit 4, R. 610-12). Much of his cross-examination was devoted to this report (R. 1121-22 1128-29, 1137, 1145-64, 1193-96). He testified that he did not know of any disease suspected to be caused by single-service containers (R. 1114), and that an advantage of the single-service container over the glass container was that the former aided the prevention of the spread of communicable diseases since the used container was not handled by milk handlers (R. 1115-6). He considered other witnesses, Drs. Sanborn, Prucha, Tracy, and Vaughn, to be competent in their fields and honest in their research work, but he disagreed with some of Dr. Prucha's interpretations of his experiments (R. 1129-34). He had never visited the Cherry River paper mill or the Gardner-Richardson Company (R. 1144).

IN THE

Supreme Court of the United States

OCTOBER TERM, A. D. 1941.

No. 706

CITY OF CHICAGO, a Municipal Corporation, BOARD OF HEALTH OF THE CITY OF CHICAGO, DR. ROBERT A. BLACK, Health Commissioner and Acting President of Board of Health of the City of Chicago,

Petitioners,

vs.

FIELDCREST DAIRIES, INC.,

Respondent.

REPLY BRIEF OF PETITIONERS.

INTRODUCTORY COMMENTS.

Before discussing the separate points made in the respondent's brief, we make the following preliminary comments on a number of matters affecting the entire case.

(*a*) *The State of Illinois has not manifested a public policy in favor of paper milk containers.*

Throughout its brief respondent speaks of the use of paper milk containers as having been "approved" or "expressly sanctioned" by the Illinois legislature (brief, pp. 15,

31, 35, 47, 56, 77, 104, 114) and of the Illinois legislature as having found paper milk containers to be "wholesome" and "safe and sanitary," (brief, pp. 56, 58, 104). The respondent exaggerates the effect of the action of the legislature in passing the Milk Pasteurization Plant Act of 1939.

Before 1939 there was nothing in the Illinois statutes about paper milk containers. They were not forbidden; they were not permitted by express language; they were not regulated. So far as the State of Illinois was concerned, paper milk containers could thus be used without hindrance. In the 1939 statute all that the legislature did as to paper milk containers was to provide in item 10 of section 15 that "single-service containers . . . shall be manufactured and transported in a sanitary manner" (ch. 56½, sec. 129, Ill. Rev. Stat. 1941). While before the statute there was no restriction, the statute imposed a restriction by requiring that, if single-service containers are used, they shall be manufactured and transported in a sanitary manner. Certainly when a state requires for the first time that shoddy used in making blankets must be subjected to bactericidal treatment, when there has been no prior regulation, it does not, by imposing the restriction, manifest a public policy in favor of shoddy blankets. Similarly when a state for the first time regulates the use of intoxicating liquor theretofore unrestricted it does not thereby manifest a public policy in favor of it. The public policy of the 1939 Act which is pertinent here is that which expresses the legislature's determination of the appropriate distribution of governmental power between state and municipality. That policy clearly views regulation by the state, not as an ultimate exercise of the full scope of the police power, but as the fixing of *minimum* requirements beyond which municipal regulation is authorized and contemplated.

(b) There is no controversy in this case between the State of Illinois and the City of Chicago.

Much of the discussion in the respondent's brief (see particularly pp. 7-9) is intended to create the impression that there is a controversy here between the "sovereign" state of Illinois and "its instrumentality," the city of Chicago. The brief even speaks of the City of Chicago as "defeating the objectives" of the State of Illinois in passing the Milk Pasteurization Act of 1939. (Of course the provision in that statute that single service containers shall be sanitary does not mean that one of the objectives of the act was to permit the use of single service containers.) The policy of the State of Illinois is indicated by the statute. In the statute the voice of the sovereign state said that the powers of municipalities were not impaired or abridged. The power of the city to prohibit paper containers is thus in accord with the expressed wish of the state. In saying "less harm can result from a decision in favor of the sovereign than one in favor of its instrumentality," the respondent's brief overlooks the fact that the decision of the Circuit Court of Appeals that the city had no power is contrary to the expressed wish of the sovereign stated in the saving clause in the statute.

Respondent's brief says (p. 9) of the decision by the Circuit Court of Appeals:

> "It actually reenforces and protects the power of the state from impairment by judicial implication from doubtful language contained in an ambiguous statute."

There is no question here of protecting "the power of the state." The city is an arm of the state government. The state itself in clear language has delegated the power to the

city. In fact the Circuit Court of Appeals, in disregarding the language of the saving clause, has impaired the power of the state to distribute powers among subordinate bodies. While terming the saving clause "doubtful" and "ambiguous," the respondent's brief does not attempt to answer the analysis of its clear language in the petitioners' brief (pp. 19-21).

The respondent argues (p. 44) that "'chaos" in regulation will result unless it is held "that the city's power is withdrawn by implication in the field actually occupied by the State of Illinois." And it is said that this would lead to "an unseemly conflict of jurisdiction between the state and the city." The legislature may withdraw the city's power at any time it sees fit. There is no conflict of jurisdiction where the state has expressly conferred the power on the city. And chaos will not result. In the case of paper milk containers, there is nothing chaotic about a city forbidding a commodity to be sold in a container which is not forbidden in other parts of the state.

(c) *Further explanation of the application of Railroad Commission of Texas* v. *Pullman Co.*, 312 U. S. 496 (1941).

The respondent says (p. 4) that the petitioners' brief (pp. 31-34) shows that there is nothing in the *Pullman Company* case "which should preclude a decision of the question of local law by a federal court." That is not the position of petitioners. As a local governmental body the City of Chicago is of course interested in the doctrine stated in that case by Mr. Justice Frankfurter (p. 501): "a doctrine of abstention appropriate to our federal system whereby the federal courts, 'exercising a wise discretion,' restrain their authority because of 'scrupulous regard for the rightful independence of the state govern-

ments' and for the smooth working of the federal judiciary."

But, as noted in the petitioners' brief (pp. 32-33), it would be a misfortune from the city's standpoint if the present litigation were not terminated by the decision of this court. The holding of the Circuit Court of Appeals on the construction of the 1939 statute has clouded the powers of Illinois municipalities to such an extent that it would be an injustice to the city if the holding remained operative during the long delay that would ensue from the remandment of the case to the trial court to await a determination of the question in the state courts. Moreover, as pointed out in the petitioners' brief, the case was not instituted in the federal court for the purpose of having the local question determined; and it is not difficult to forecast the Illinois law on the question of the city's power under the clear language of the 1939 statute, particularly in view of the recent decision of the Illinois Supreme Court in *City of Geneseo* v. *Illinois Northern Utilities Co.*, 378 Ill. 506, 39 N. E. 2d 26 (1941), [the decision became final on January 15, 1942, after the filing of the petitioners' brief in this case]. Furthermore, the opinion of the Circuit Court of Appeals (R. 1794) discussed the reasonableness of the ordinance in such a way as to indicate clearly that the ordinance was unconstitutional. The importance of the constitutional validity of public health regulations seems clearly to call for a review by this court of the dictum of the Circuit Court of Appeals on the constitutional question.

Strangely enough, the respondent in its brief takes a position that seems to call for the application of the *Pullman Company* case here. If the spurious controversy between the State of Illinois and the City of Chicago fabri-

cated by the respondent had any basis in fact, this case would certainly be one that should be determined in the state courts.

Nevertheless, for the reasons noted in the petitioners' original brief, we continue to urge this court to make a final disposition of the questions presented.

The respondent argues (pp. 5-6) that the issues presented should be summarily determined by a *per curiam* opinion to the effect that the decision of the Circuit Court of Appeals should be affirmed because a question of local law has been passed upon by federal judges on the spot. This argument is based on the recent decision by this court in *MacGregor* v. *State Mutual Life Insurance Co.*, decided February 16, 1942, No. 179, October Term, 1941. That case is entirely different from the case at bar. It did not present a question of public law. There federal jurisdiction was based solely on diversity of citizenship. Here federal jurisdiction is based upon the existence of a federal constitutional question as well as on diversity of citizenship. And there a constitutional question was not discussed by the Circuit Court of Appeals, as it was by the Circuit of Appeals in the case at bar (R. 1794).

(d) Respondent's use of the term "paper milk bottles" and other assumptions in the respondent's brief.

Throughout the respondent's brief there is a studied use of the term "paper milk bottles." One of the issues in this case is whether or not a paper container *is* a "milk bottle." The Circuit Court of Appeals held that it is not. The repetition of "paper milk bottles" seems to be employed by the respondent on the theory that, by saying it often enough, it could induce a belief that its paper containers are "milk bottles." Similar devices of the propa-

gandist, "puffing" paper milk containers in the manner of an advertiser, are used throughout the respondent's brief.

For example, the respondent says (p. 64) that the trial court's holding that paper containers should be permitted was a holding that the law "should adopt the best scientific thought of the age," as if in some way the city's prohibition of paper containers to safeguard the city's milk supply was in conflict with modern sanitary standards. The record does not show this, for as the master found (R. 1734) the testimony of the *respondent's own witnesses* indicated that "the City Council could reasonably have concluded that prohibition of paper containers was necessary and appropriate to protect the purity and wholesomeness of milk." Similar assumptions in the respondent's brief are that the use of paper milk containers "promotes public health and proper sanitation" (brief, pp. 63-64); and that the requirement of the Illinois legislature that paper containers be manufactured and transported in a sanitary manner means that the City of Chicago, in forbidding their use, defeats "the liberal and progressive attitude of the state" (brief, p. 9). Throughout the respondent's brief are many statements on which there is no evidence whatever, some dealing with events that have obviously occurred since the trial. The respondent even goes to the extent of arguing that "considerations of present national policy in conserving automobile tires and man power are promoted by paper milk bottles" (brief, pp. 119-120). Milk is said to be sold in paper containers to army camps throughout the country "without a suggestion of ill effect" (brief, p. 105). It is said there has been no harm from the use of paper containers in Chicago sold under the protection of the injunction issued by the trial court in the case at bar (brief, p. 67).

These and similar statements in the respondent's brief deal with matters for the sole determination of the legislative body. Since they are outside of the record, they are not answered further in this reply brief, however weighty the countervailing considerations may be.

I.

The Illinois Milk Pasteurization Plant Act of 1939 did not deprive the city of power to pass the ordinance.

(Reply to respondent's Point I, brief, pp. 4-51).

The respondent's brief seems to lose sight of the fact that the question presented is one of statutory construction: did the Illinois legislature, in providing that when paper milk containers are used they must be manufactured and transported in a sanitary manner, thereby impliedly repeal the provision in the 1872 Cities and Villages Act giving the city the power to regulate the sale of milk? Repeals by implication are not favored.

Outstanding is the failure of the respondent to deny that the holding of the lower court means that the city's power under the 1939 statute is less than it was before. The holding means that the city's power *was* impaired by the statute, although the saving clause in section 19 of the statute says expressly, "*Nothing in this act shall impair or abridge the power of any city . . . to regulate . . . the . . . distribution of . . . milk . . .*". Moreover:

(a) The respondent does not discuss the meaning of the particular words in the saving clause. These words state emphatically and unmistakably that the power of the city under the 1939 statute is the same as it was under the 1872 statute (except for the inapplicable proviso). See petitioners' brief, pp. 19-21.

(b) The respondent does not answer the petitioners' contention (pp. 18-19) that, since the saving clause and

the title of the statute are in identical terms, the saving clause is as broad as language could make it and, whatever aspect of the milk industry is regulated by the statute, the legislature has said expressly that the city retains its power to regulate.

(c) The respondent does not answer the petitioners' contention (brief, p. 19) that the proviso in the saving clause evidences a legislative intention that only matters within the proviso are excepted from the broad operation of the saving clause under the rule, *expressio unius est exclusio alterius*, and consequently the power to forbid the use of paper milk containers is retained.

(d) The respondent does not answer the petitioners' contention (brief, pp. 24-25) that the Circuit Court of Appeals found that the ordinance conflicts, not with the entire statute, but with a part of it; and that the court's reasoning was basically fallacious in considering the effect of a part of the statute on the city's power *before* it considered the meaning of the clause that preserves the city's power. In fact the respondent commits the same error: *before* considering the meaning of the saving clause (respondent's brief, p. 34 *et seq.*), the respondent (brief, pp. 10-33) argues and concludes that the ordinance conflicts with the statute. There is no conflict between the ordinance and the statute when the statute is considered as a whole.

Inconsistencies in Respondent's Argument.

In arguing that the saving clause is not effective here, it was obviously necessary for the respondent and the Circuit Court of Appeals to attempt to show what the saving clause does mean. This attempt has involved both the lower court and the respondent in a maze of inconsistencies. The respondent argues first (brief, p. 26) that in the 1939 statute

> "the utmost care is taken to include *all important details* with reference to the sale and distribution, as well as the pasteurization, of milk, and to give the State Director of Health power to supplement the requirements."

And again the 1939 act is said to regulate "in detail *the entire field of milk distribution*" (brief, p. 34). Then, when the respondent comes to discussing the saving clause, the brief says (p. 36) that the saving clause leaves the city's power unimpaired "as to all those numerous matters not governed by the statute" and that the city's power is preserved "on those subjects not occupied by the state system of supervision" (p. 48).

Thus, while the statute is said to occupy the entire field, the saving clause is said to preserve some of the city's power. Yet the brief also says (p. 44) that the statute withdraws the city's power "in the field actually occupied by the state." And the statute is said to show no intention to permit cities "to occupy the same field of regulation as the state" (p. 33). Clearly there is nothing left for the city to regulate if the 1939 statute covers "all important details with reference to the sale and distribution, as well as the pasteurization, of milk." Moreover, the respondent's interpretation of the saving clause conflicts with that of the majority opinion of the Circuit Court of Appeals, which said:

> "The purpose of the saving clause, in our judgment, was to preserve in the city the unquestioned right to continue *in a field which had been entered by the state, and in which, thereafter, each should have co-extensive power and authority.*" (R. 1793; italics added.)

And this statement in the opinion is inconsistent with the court's holding that the 1939 statute has deprived the city of power to forbid the use of paper containers, (see petitioners' brief, p. 29).

Similarly, the respondent is inconsistent in arguing (pp. 50-51) that under the 1939 statute the city may *regulate* paper containers although it may not *prohibit* their use.

This also was said in the majority opinion of the Circuit Court of Appeals. The basis of the contention that the city may not prohibit their use is that the state has entered the field by providing that paper containers must be manufactured and transported in a sanitary manner. The same argument strikes down the power of the city to regulate. For example, if the city should require that the paraffin bath in which the container is dipped must have a certain temperature which happened to be higher than that required by the state, the city's regulation would be in the field occupied by the state. And the argument of state approval would also apply, since the container would meet the state requirements as to the temperature of the paraffin bath and the city would be prohibiting what the state permitted.

Similarity of Saving Clause in 1941 Grade A Milk Law.

Respondent concedes (brief, p. 32) that the language of the saving clause contained in the 1941 Grade A Milk Law is effective to express the legislative intention that municipalities retain the power to enforce more rigid sanitary requirements than are provided by statute. This concession makes it appropriate to point out the origin of the difference in language between the saving clauses in the two statutes. The saving clauses in the two statutes, although phrased in different words, express an identical legislative purpose.

The Grade A Milk Law and the Milk Pasteurization Law were companion pieces of legislation introduced in the 1939 session of the Illinois General Assembly as Senate Bills 287 and 288, respectively. Both bills were passed by the General Assembly and approved by the governor but the saving clause which had been added to S. B. 287 (the Grade

A Milk Law) was omitted from the engrossed bill as signed by the governor. The omission was not immediately noted and the bill, without the saving clause, was printed in the 1939 Session Laws of Illinois (Laws of Ill. 1939, pp. 667-670). On January 26, 1940 the attorney general issued an opinion holding that the act as it appeared in the Session Laws of 1939 was void because of the omission of the saving clause.*

On August 4, 1939 (apparently before the omission of the saving clause had been called to his attention) the Director of the State Department of Public Health promulgated his "minimum requirements" under the Act and published the Act and the minimum requirements promulgated by the Department in pamphlet form. ("Grade A Milk Law and Minimum Requirements for Interpretation and Enforcement Published by Illinois Department of Public Health," printed by the authority of the State of Illinois, 1939). As published, the statute and the minimum requirements were preceded by an explanatory "introduction" which is so pertinent to the question of legislative construc-

---

*The story appears in the opinion of the attorney general addressed to the director of the Department of Public Health, holding the 1939 Grade A Milk Law invalid because of the omission of the saving clause from the bill as signed by the governor (Illinois Attorney General's Report and Opinions, 1940, pp. 69-71). The legislative history of the 1939 legislation appears in Senate Journal Illinois 1939, pp. 250, 357-8, 429, 439-40, 461, 690, 1421-2; House Journal Illinois 1939, pp. 934, 964, 1011, 1019, 1155, 1246, 1368, 1532, 1546, 1589, 1636, 1796-7, 1872, 1890.

tion involved in this case that its opening paragraphs are set forth in a footnote.*

---

*"This 'Grade A Milk' Act does not make the grading or grade labeling of milk compulsory. The use of the grade A label is entirely voluntary with each dairyman or distributor. The Act does control the use of the Grade A label to the extent of setting up standards or minimum requirements for the production, handling, and processing of milk so labeled. It empowers the Director of the Department of Public Health to enforce such minimum requirements and it provides penalties for violations.

"The Act establishes State-wide standards or minimum requirements and definitions of "Grade A Milk" and "Grade A Milk Products." It prohibits the misuse of the Grade A label, and was enacted to protect the consumer of milk from the dairyman or distributor who would label his product as Grade A without regard for the sanitary conditions of its production, handling, processing and distribution.

"In order to protect the health of consumers, many municipalities in the State have adopted milk sanitation control ordinances recommended by the Department. These ordinances provide for the labeling of milk as "Grade A", when the provisions of the ordinances have been complied with as determined by local sanitarians. This Act goes further and makes it possible for a dairyman or distributor located where there is no local sanitary supervision of milk supplies, to produce and distribute milk as "Grade A Milk", when the provisions of the law have been complied with as may be determined by the Department of Public Health, after inspection of the premises and investigation of methods. Continued use of the label depends on continued operation of the dairy or milk plant in conformity with the law and requirements. * * * "Grade A Pasteurized Milk" means the same quality of milk as that identified with the Grade A raw label but which has the added protection of pasteurization. The fact that the Act legally recognizes raw milk does not relieve health authorities of the responsibility of advocating pasteurized milk as the only assuredly safe milk supply.

"In formulating the minimum requirements authorized in Section 16 of the Act, for the interpretation and enforcement of the Act, the form and contents have been patterned as near as practicable to the Grade A ordinances in force in municipalities of this State and throughout the United States. *This Act will in no way conflict with existing municipal grading ordinances. Municipalities are empowered to enact and enforce more rigid sanitary requirements than are provided in the Act.*"

The identical language appears in the introduction to the pamphlet publication of the 1941 Grade A Milk Law which was published after the reenactment of the statute in 1941. (Grade A Milk Law and Minimum Requirements for Interpretation and Enforcement. Educational Health Circular No. 135.) No introduction was published in connection with the pamphlet publication of the Milk Pasteurization Law.

Reference to the legislative history of the two statutes shows that the saving clauses originated by amendment in the house of representatives on successive days (S. B. 297, June 27, 1939, H. J. Ill. 1939, p. 1589; S. B. 288, June 26, 1939, H. J. Ill. 1939, p. 1532).

The 1941 Grade A Milk Law is a reenactment of the 1939 act. The language of the saving clause which respondent concedes to be effective to preserve municipal power originated in 1939, one day after the language of the saving clause involved in this case. Omitting the portions of the two saving clauses which repeat the language of the titles of the respective acts, they read as follows:

The Grade A Milk Law:

> "Nothing in this Act shall impair or abridge the power of any city, village or incorporated town to regulate * * * provided the minimum requirements under this Act are observed."

The Milk Plant Pasteurization Law:

> "Nothing in this Act shall impair or abridge the power of any city, village or incorporated town to regulate * * * provided that such regulation not permit any person to violate any of the provisions of this Act."

The language of the two saving clauses will not support a difference in interpretation. Any violation of the state law is a failure to observe the minimum requirements of the state law—and any failure to observe the minimum requirements of the state law is a violation of the state law. Of course meticulous perfection might require that if the intention is identical, identical language should be used. But the goal of pedantic perfection vanishes in the reality of the legislative atmosphere. To say that a precise sense of orderliness would indicate identity of language is

not at all to say that different words may not be used to express a single thought.

To say that these two saving clauses originating on successive days express entirely different notions about a matter so fundamental as the distribution of important public health powers between a state and its municipalities, more must be required than a mere difference in choice of words. The primary object of the Milk Pasteurization Law is to regulate conditions in the pasteurization plant. The primary purpose of the Grade A Milk Law is to regulate conditions upon the dairy farm. So far as the City of Chicago is concerned, the two acts cover the entire scope of municipal regulation pertaining to milk.*

If there can exist any reason why the state should be considered to have preempted the field of permissible regulation with respect to pasteurization plants, while municipal and state regulation are permitted to exist side by side in the field of regulation of the dairy farm, that reason does not occur to us and has not been suggested in this case. Certainly the use of the words "provided that such regulation not permit any person to violate any of the provisions of this Act" contrasted with the words "provided the minimum requirements under this Act are observed" does not accomplish this result.

Importance of Recent Case of City of Geneseo v. *Illinois Northern Utilities Co.*

The respondent cites two of the many cases involving the question of whether or not the Illinois Public Utilities Act had repealed by implication powers theretofore granted to Illinois municipalities. *Village of Atwood* v.

*This is true because under the Chicago Milk Ordinance only grade A milk is permitted to be sold (R. 45).

Cincinnati, etc. R. Co., 316 Ill. 425 (1925), and *Northern Trust Co.* v. *Chicago Railways Co.*, 318 Ill. 402 (1925). The language of the opinions in these two cases has been somewhat restricted by a case just decided by the Illinois Supreme Court.

This latest case is *City of Geneseo* v. *Illinois Northern Utilities Co.*, 378 Ill. 506, 39 N. E. 2d 26 (1941) [the decision did not become final until the denial of a motion to reconsider on January 15, 1942, which was after the petitioners filed their brief in the case at bar.] In that case article 5 of the 1872 Cities and Villages Act granted cities the power to regulate the use of streets. These provisions had been held by Illinois courts to authorize cities and villages "to regulate and control the use of their streets and this included the right to grant to or to withhold that use from utilities." The Illinois Public Utilities Act of 1921 (sec. 1 *et seq.*, ch 111-2/3, Ill. Rev. Stat. 1941) granted to the Illinois Commerce Commission complete control over public utilities. Section 49a of the act, added in 1935, provided that a public utility should not abandon or discontinue its service without having secured the approval of the commission. Other sections of the statute, as originally enacted and as added by amendment, gave the Commerce Commission extremely broad powers over all aspects of public utilities.

In that case an electric utility had been granted a franchise by a city to place its poles and other equipment upon and under the streets. When the franchise expired, the utility company refused to remove its equipment. An ordinance was passed directing removal. The city then also filed a suit for a mandatory injunction to compel the removal of the equipment. This suit finally reached the

Illinois Supreme Court, which held squarely in 1936 that the Public Utilities Act had withdrawn from the city the power to determine whether or not the utility company should continue or cease its business in the city [*City of Geneseo v. Illinois Northern Utilities Co.*, 363 Ill. 89 (1936)]. The Supreme Court in its opinion used language similar to that used by the respondent in the case at bar:

> "It is obvious that by this enactment [the Public Utilities Act] it was the legislative intent to withdraw from local municipalities supervision of public utilities and to vest the same in the Commission with the exclusive power of regulation and control of all means and instrumentalities used by the utility in the conduct of its business" (363 Ill. 95).
>
> "To permit the city to exercise control over the instrumentalities of a public utility occupying the city streets would be to give to the city in that respect concurrent jurisdiction with the Commission of a public utility, a result not contemplated by the statute and one which cannot be drawn therefrom by a legitimate interpretation thereof" (363 Ill. 97-98).

After this adverse decision, the city filed a complaint with the Commerce Commission praying that the utility be ordered to remove its equipment from the streets. The commission denied the prayer of the complaint on the ground that public convenience and necessity did not require the termination of the service of the utility. This proceeding also eventually reached the Illinois Supreme Court and in this recent decision *it completely reversed its former holding.*

Obviously the regulation of public utilities by the Commerce Commission and the regulation of the sale of milk involve different problems; and the Illinois Public Utilities Act is of an entirely differently character from that of the Milk Pasteurization Act of 1939. Nevertheless the decision

in the *Geneseo* case is extremely important here because it represents the present attitude of the Illinois courts toward legislative grants of municipal power. As we have said repeatedly, the case at bar presents a simple problem because it is only necessary to look to the clear and unambiguous language of the saving clause in the 1939 statute. But the opinion in the *Geneseo* case answers a number of the arguments presented by the respondent. We note a number of matters discussed in the opinion.

1. After stating the proposition that a grant of a specific power will impliedly repeal a like power previously granted to a municipality, the opinion continued (378 Ill. 514):

> "*This is not necessarily true where there is merely such a conflict between the granted powers of the respective governing bodies that part may remain in effect and part remain unaffected.*" (Italics ours.)

In the case at bar the prohibition of the use of paper milk containers by the City of Chicago may remain in effect even though the 1939 statute provides that paper milk containers "shall be manufactured and transported in a sanitary manner."

2. In an earlier case [*Chicago Motor Coach Co.* v. *City of Chicago*, 337 Ill. 200, 169 N. E. 22 (1929)] the Illinois Supreme Court had held that the city had no power to prohibit the operation of motor busses in the city streets when the motor busses had a certificate of convenience from the Commerce Commission. The ground of the decision was that the earlier power of the city to regulate the use of the streets had been repealed by implication by the Public Utilities Act. In the *Geneseo* case the *Chicago Motor Coach Company* case was discussed at length. The following comment on the *Chicago Motor Coach Company* case completely an-

swers the distinction attempted to be drawn by the respondent in the case at bar between "regulation" and "prohibition." The court said (378 Ill. 518):

> "As the basis of its decision the court held that the city never had any right under any of the powers granted to it by the legislature to *prohibit* the operation of automotive vehicles on the city streets, and while it had power under paragraph 65.8, to *regulate* the use of the streets by such vehicles, regulation was inconsistent with prohition or exclusion." (Italics added.)

And the court later said that this language in the earlier case "is not adhered to" (378 Ill. 530).

3. The opinion of the Illinois Supreme Court shows that the problem is one of statutory construction—that is, whether or not the later exercise of power by the state repeals the earlier grant of power to the municipality. Of repeals by implication in this type of legislation the court said (378 Ill. 529):

> "Repeals by implication are not favored. It is only when there is a clear repugnancy and both acts cannot be carried into effect that the former is repealed. *People* v. *Burke*, 313 Ill. 576, 145 N. E. 164; *People* v. *Czarnecki*, 256 Ill. 320, 100 N. E. 283. Statutes which are seemingly repugnant should, if possible, be so construed that the subsequent act may not operate to repeal by implication the earlier act. *People* v. *Board of Education*, 349 Ill. 390, 182 N. E. 455; *People* v. *Shader*, 326 Ill. 145, 157 N. E. 225. Where a special act is repugnant to or inconsistent with a prior general statute a partial repeal of the latter will be implied or exception grafted upon the general statute. *People* v. *Missouri Pacific Railroad Co.*, 342 Ill. 226, 173 N. E. 816. In determining whether one statute is repugnant to another the court should consider its several parts in connection with correlated sections in pari materia. *People* v. *Board of Education, supra.* The repeal by implication of one act by a later act is not effected by

mere conflicts or inconsistencies between them, but only where the carrying out of the later act prevents the enforcement of any part of the former. To the extent they are in conflict the first act is repealed, but the parts of the first act not affected remain in full force and effect."

4. Of the attitude of the court in construing legislation of this type the opinion also said (378 Ill. 533):

> "It is not for us to judge the propriety of legislation, but to construe the laws when enacted. The legislature has not seen fit to say, in express language, or by the enactment of directly conflicting provisions, that the control of the occupancy of the streets of a city has been transferred to the Illinois Commerce Commission, and, as we construe the law, they never did intend so to do."

In the case at bar the majority opinion of the Circuit Court of Appeals, in saying that the power of the city to forbid the use of paper containers would result in "chaos" and would make the state "subservient" to the city, was not "construing" the saving clause but judging "the propriety of legislation."

5. The Public Utilities Act involved in the *Geneseo* case contained a saving clause (sec. 81; ch. 111⅔, sec. 85, Ill. Rev. Stat. 1941) reading as follows:

> "Nothing in this Act shall be construed to limit or restrict the powers now or hereafter granted to cities to pass ordinances for the protection of the public health, safety, comfort and the general welfare, or governing the regulation, control or occupation of streets, highways and public property within the city."

The language of this clause is obviously of limited effect in comparison with the wide scope of the Public Utilities Act and is much less comprehensive than the saving clause in the Milk Pasteurization Plant Act of 1939, which, being

in the same language as the title of the act, necessarily covers everything within its scope. Neverthless, in the *Geneseo* case the Illinois Supreme Court gave a *broader* interpretation to the saving clause than had been given in earlier decisions. In *Village of Atwood* v. *C. I. & W. R. R. Co.*, 316 Ill. 425 (1925), the court had said (p. 429) that section 81 concerned only local utilities in cities which had adopted article VI of the act. In *Chicago Motor Coach Co.* v. *City of Chicago*, 337 Ill. 200 (1929), and in the first *Geneseo* case, 363 Ill. 89, 96 (1936), the court had held that the saving clause related only "to the original installation or construction of the utilities upon the streets and not to the supervision, regulation and control of the operation of such facilities after installation." Both of these earlier constructions of the saving clause were rejected in the opinion in the second *Geneseo* case (378 Ill. 523-524, 530.

6. In the *Geneseo* case the Illinois Supreme Court emphasized the importance of the maintenance of municipal authority. Counsel for the utility company had pointed out the financial effect of the decision upon utility companies. In commenting on this factor in this case, the court said (378 Ill. 533):

> "Giving full weight to appellee's claim of the extent the construction herein will affect public utilities, it is equally true *the opposite construction will have as great, if not greater, effect upon the administration of corporate powers by cities and other municipalities.*" (Italics added.)

The Illinois Supreme Court's concern for the powers of Illinois municipalities is in great contrast to that shown by the Circuit Court of Appeals in the case at bar.

* * * * * *

The respondent does not mention the fact (noted in petitioners' brief, p. 14) that the 1872 statute has been supplanted since 1939 by the 1941 Revised Cities and Villages Act, which, in a provision more specific than the earlier provision in the 1872 act, provides expressly that the city has the power to regulate "the manner in which any beverage or food for human consumption is sold" (see petitioners' brief, p. 14). Even if the 1939 statute repealed impliedly the former grant of power in the 1872 act (which of course we deny), this new provision has not only re-conferred the power on the city but has expanded the city's power. Section 50 of the 1872 act gave the city power "to regulate the sale of . . . provisions and to provide for the place and manner of selling the same." The new statute uses the word "beverage" which was not in the former statute. While the older statute gave the city power "to provide for" the manner of selling, the new statute says the city may "regulate the manner in which" the beverage is sold.

The respondent's discussion (pp. 37-39) of an earlier case does not detract from the pertinence here of *City of Ottawa* v. *Brown*, 372 Ill. 468 (1939). It is of vital importance here as indicating the attitude of Illinois courts in construing legislative grants of municipal power. There, as here, the city had a power to regulate under the 1872 Cities and Villages Act. There, as here, the state began to regulate. There, as here, the statute contained a saving clause. And there, as should have been held here, the Illinois Supreme Court held that the pre-existing power of the city was retained by the saving clause, although the same claims of conflict between city and state regulation could be made as are made here.

The respondent reiterates the idea that the city regulations may not prohibit what the state permits (brief, pp.

66, 63) and this is said to be a condition of a valid ordinance. There is no rule of law to this effect. The state may authorize the city to forbid what the state permits. If this were not true, it would be impossible for city regulations to go further than state regulations. The respondent attempts to extract a purported rule to the contrary from the opinion of the Illinois Supreme Court in *City of Chicago* v. *Union Ice Cream Mfg. Co.*, 252 Ill. 311-315, (1911). There, in holding an ordinance valid, the court noted in passing that the ordinance "does not prohibit what the statute permits." There was no holding that any ordinance is invalid which prohibits what the statute permits, as argued by the respondent.

The respondent (pp. 23, 57) seems to deny that even before the 1939 statute the city had power to forbid the use of paper milk containers. There is no argument in support of this contention. As shown by the lengthy discussion in the petitioners' brief (pp. 13-17), the 1872 Cities and Villages Act contained numerous provisions that gave the city, as held in *Koy* v. *City of Chicago*, 263 Ill. 122, 131 (1914), the power to require that "the receptacle in which milk is contained . . . be of prescribed character." The opinion of the Circuit Court of Appeals so interpreted the *Koy* case when it referred to "the broad field of regulation which it (the city) had theretofore had as recognized in *Koy* v. *City of Chicago*, 263 Ill. 122."

The respondent's brief (pp. 12-19) cites a number of Illinois decisions. The question presented in all of the cases was one of the intention of the legislature: did the statute involved indicate an intention to withdraw the power of the municipality? In some of the cases there had been an early statute granting the power, an exercise of the power by the municipality, and then a later statute by which the

state did what the municipality had been authorized to do; and the later act was held to repeal the earlier by implication. The respondent's brief does not state clearly that the question presented here is one of statutory construction: did the 1939 statute repeal by implication the broad grant of power to the city in the 1872 Cities and Villages Act? The great extent of the power is shown by *Koy* v. *City of Chicago*, 263 Ill. 122 (1914). The saving clause in the 1939 statute, in saying that the power of cities is not impaired or abridged, states expressly that there is no repeal whatever of the power of a city or village, so that the statute may not be said to have impliedly repealed anything. In none of the cases cited in the respondent's brief (pp. 12-19) was there an operative saving clause as in the case at bar.

City of Rockford v. *Hey*, 366 Ill. 526 (1937), discussed at length by the respondent (brief, pp. 19-21, 50) was neither relied on nor cited by the Circuit Court of Appeals. It has no bearing here. That case held invalid an ordinance that required ice cream manufacturers to pay a license fee to the City of Rockford for inspection of their factories *in other cities*. The question there, as noted in the opinion (p. 530), was whether or not the City had authority to empower "inspectors of its health department to go beyond the corporate limits to inspect ice cream factories." No such question is raised here by the provision in the ordinance that "milk sold in quantities of less than one gallon shall be delivered in standard milk bottles." Here the ordinance operates only within the City of Chicago. The respondent was not refused a permit to sell milk in Chicago because its plant outside of Chicago does not comply with Chicago regulations but because the respondent seeks to sell milk in Chicago in a manner forbidden by the ordinance. The Chicago ordinance applies to milk sold

in Chicago whether placed in the container within or without the corporate limits. The vice in the Rockford ordinance, as noted in the opinion (p. 534), was that the legislature had not given municipalities power "to pass a regulatory and license ordinance which assumes to regulate ice cream factories outside their corporate limits." The prohibition of the use of paper milk containers in Chicago does not assume to regulate the respondent's plant at Chemung, Illinois.

The respondent discusses the statute at length in an attempt to establish a conflict between the ordinance and the 1939 statute. The sections of the statute and the regulations of the Department of Health merely contain some provisions *about* paper milk containers. They do not say that paper milk containers must be permitted, but merely recognize and regulate their use. The respondent's statement (pp. 50-51) that the State of Illinois "makes it illegal" for the plaintiff to sell milk in any way but in paper containers is clearly wrong. It may be that the plaintiff has no equipment to bottle milk and that the state regulations forbid the use of paper-container equipment for filling glass containers. But the state does not prevent the plaintiff from using other equipment to fill glass containers or from selling milk in glass containers.

In discussing the rule that the statute controls where there is a conflict between a statute and an ordinance, the respondent (p. 15) cites the quotation of the Circuit Court of Appeals (R. 1791) from 2 McQuillin on Municipal Corporations (2d Ed. 1928) 572. The court did not quote the entire sentence. The word "established" at the end of the quotation is not followed by a period but by a comma and, after saying that an ordinance may not be contrary to a

public policy expressed in legislation, the text continues with the following words:

> "unless there is a specific, positive, lawful grant of power by the state to the municipality to ordain otherwise, in which event the specific, positive, lawful grant is from the same source of authority that made and has been expressed through legislation the policy of the state."

This important clause not only shows that the problem is one of statutory construction, but applies expressly to the "specific, positive, lawful grant" of power to the city in the saving clause.

The respondent also quotes (p. 15) from 43 Corpus Juris 215-17, section 219, which states the general rule about conflicting ordinances and statutes. A more specific discussion in section 220 (pp. 218-220) shows that there is no conflict in the present case.

> "The rule that a municipal ordinance in conflict with a state law is void does not apply unless the state law with which the particular ordinance conflicts is intended to apply, and is, in fact, applicable and imperative in the particular municipal corporation in which such ordinance has been enacted" (43 Corpus Juris 219).
>
> "The fact that an ordinance enlarges upon the provisions of a statute by requiring more than the statute requires creates no conflict therewith, unless the statute limits the requirement for all cases to its own prescriptions" (43 Corpus Juris 219-220).

The respondent (pp. 39-43) cites a Missouri and a Connecticut case on this point. In each case, the municipality forbade the sale of "raw" (i.e. unpasteurized) milk. In each case the state legislature had provided by statute for the sale of various types of milk, including raw milk. In one case, *Shelton* v. *City of Shelton*, 111 Conn. 433, 150 Atl.

811 (1930), the state statute permitting the sale of raw milk contained a saving clause to the effect that the statute should not affect the authority of a municipality to enact an ordinance "for the control, regulation, sale or distribution, within its limits, of milk which might be detrimental to the public health." It was held by a court divided three to two that this saving clause did not permit the municipality to forbid the sale of raw milk. The parties stipulated that raw milk was not "detrimental to the public health," so that the saving clause was clearly inoperative. In the other case, *State ex rel. Knise* v. *Kinsey*, 314 Mo. 80, 282 S. W. 437 (1925) it was held that an ordinance forbidding the sale of raw milk was invalid: There the state statute permitting the sale of raw milk *did not contain a saving clause* so that another statute giving the municipality power "to license and regulate milk dairies and the sale of milk" was repealed by implication. The factors noted clearly distinguish the case at bar from the Missouri and Connecticut cases. Moreover, on the peculiarly local problem presented here the decisions of non-Illinois courts are not important precedents. This is particularly true in view of the recent decision of the Illinois Supreme Court in the second *Geneseo* case discussed above.

II.

The fact that the State of Illinois regulates paper containers does not make unreasonable the ordinance prohibiting their use.

(Reply to respondent's Point II, pp. 52-60.)

There are two aspects to the respondent's contention on this point: (1) there is said to be a rule in Illinois that an ordinance must be reasonable aside from any question of constitutionality; (2) the unreasonableness of the ordi-

nance is said to be shown conclusively by the 1939 Milk Pasteurization Plant Act. The second point shall be considered first.

The respondent relies here upon the same factor relied upon in its Point I to show that the city lacked power to enact the ordinance—i.e., that the legislature has "approved" paper containers and found them to be "safe and sanitary" and "wholesome." The respondent speaks of "the approval of this type of container by the sovereign" and says that this is a type of container "which the supreme legislative authority of this state has permitted and approved and declared safe and sanitary" (brief p. 55). The approval relied on occurred in a statute that, through the saving clause in section 19, expressly preserved the city's power to forbid what the state approved. The approval operated only to the extent intended by the legislature and was granted subject to more stringent restrictions imposed by municipalities. This completely destroys the foundation of the respondent's argument. Its fallacy is further shown by its inevitable result. Once the state had regulated anything there could be no further regulation. The state could not give a city power to regulate further, for the city's more stringent restriction would be unreasonable as a matter of law. The respondent's argument, if adopted by the courts, would impose a serious limitation on the state's authority to make what it deemed a desirable distribution of internal governmental powers.

While the charge in the complaint (R. 14) was that the ordinance violates the due process clauses of the Illinois and federal constitutions, the respondent argues that there is some rule peculiar to Illinois that makes ordinances invalid if they do not meet the concept of "reasonableness," even apart from constitutional law.

This is said (respondent's brief, p. 54) to be an Illinois rule, "much more favorable to judicial review of municipal action than that of other jurisdictions." That this is an erroneous interpretation of the Illinois cases is shown by the fact that the case of *City of Lake View* v. *Tate*, 130 Ill. 247 (1889), the case cited by the respondent (p. 52) as establishing the rule and cited also in later Illinois cases, indicates the rule to be a general principle of the law operative everywhere. The *Tate* case quotes (p. 252) the classic work, Dillon on Municipal Corporations, as authority for the rule. The question of unreasonableness under this rule is determined by the same principles that operate in applying the due process clause. In the *Tate* case (p. 252) the court said that, in determining the question, "the court will have regard to all the circumstances of the city, the objects sought to be attained, and the necessity which exists for the ordinance." Also under this rule, the same presumption of validity exists as when the validity of an ordinance under the due process clause is raised. In *Chicago and Alton Railroad Co.* v. *City of Carlinville*, 200 Ill. 314 (1902), quoted from by the respondent (p. 52), the court said (p. 322):

> ". . . This ordinance, to be valid, must not, therefore, be unreasonable. The presumption, however, is in favor of its validity and that it is reasonable, and it is incumbent upon appellant to point out and show affirmatively wherein such unreasonableness consists. (*People* v. *Cregier*, 138 Ill. 401.) Ordinances of the character of the one under consideration are passed *under and by virtue of the police power*, which has been defined, in general terms, 'as comprehending the making and enforcement of all such laws, ordinances and regulations as pertain to the comfort, safety, health, convenience, good order and welfare of the public.' (*Culver* v. *City of Streator*, 130 Ill. 238.) The determination of the question whether or not the ordi-

nance in question was reasonably necessary for the protection of life and property within the city was committed, in the first instance, to the municipal authorities thereof by the legislature. *When they have acted and passed an ordinance it is presumptively valid; and before a court would be justified in holding their action invalid, the unreasonableness or want of necessity of such a measure for the public safety and for the protection of life and property should be clearly made to appear. . . .*" (Italics added.)

Thus whether the ordinance is challenged as unreasonable under the due process clause or under a principle of the law of municipal corporations, the question presented is the same. As stated in the *City of Carlinville* case quoted above, it is a question of the valid exercise of the police power and "the unreasonableness or want of necessity of such a measure for the public safety and for the protection of life and property should be clearly made to appear." The petitioners have shown in their original brief (pp. 40-78) that the evidence here does not prove that the ordinance is clearly unreasonable. This answers the attack on the ordinance, whether the attack is based on an alleged violation of a constitutional right or otherwise.

The respondent (p. 53) cites *City of Chicago* v. *Chicago & North Western Ry. Co.*, 275 Ill. 30 (1916), and notes that a provision of the Chicago milk ordinance was there held invalid. The regulation involved was held invalid because it was physically impossible to make the tests required (see opinion, pp. 36-37), and this was in effect conceded by counsel for the city in the Supreme Court. The case illustrates, however, how reluctant the Illinois courts are to overturn ordinances regulating the milk industry. Although evidence was taken in the trial court, the Supreme Court reversed the case for further proceedings in the belief that proof might be presented to show that the ordi-

nance could be complied with. And the court reaffirmed the broad powers of the city over the milk industry (p. 39):

> "We realize how important this question is to the health of the people of Chicago and the State at large, and we have no hesitation in re-affirming the rules laid down in *Koy* v. *City of Chicago, supra,* and *City of Chicago* v. *Bowman Dairy Co., supra,* with reference to the right of the authorities of the city of Chicago to make all proper and reasonable regulations with reference to the care, transportation, sale and delivery of milk in order to protect and promote the health of the people,—especially the children,—of that great city. . . . ."

In view of the respondent's claim that the Illinois courts interfere with municipal regulations more readily than the courts of other states, we quote from *Gundling* v. *City of Chicago,* 176 Ill. 340 (1898), where a city regulation of the sale of cigarettes was upheld, the opinion stating (p. 349):

> "When the city council considers some occupation or thing dangerous to the health of the community, and in the exercise of its discretion passes an ordinance to prevent such a danger, it is the policy of the law to favor such legislation as being humane and essential to the preservation and protection of the community. Municipalities are allowed a greater degree of liberty of legislation in this direction than any other. The necessity for action is often more urgent and the consequences of neglect are more detrimental to the public good in this than in any other form of local evil. . . . "

The respondent says (p. 57) that this suit was filed challenging the city's power to prohibit paper containers before the passage of the 1939 act and that "the city's assumption that it had such power prior to the passage of the statute is highly debatable and vigorously contested." The complaint (R. 14) seems clearly to indicate that the only ground of invalidity alleged was under the federal

and state constitutions. Moreover, while making the above statement, the respondent presents no argument to show that the city lacked the power before the 1939 statute. We submit that petitioners' brief (pp. 13-17) establishes the power of the city under the 1872 Cities & Villages Act as construed by the Illinois Supreme Court in a number of cases, particularly *Koy* v. *City of Chicago*, 263 Ill. 122 (1914).

III.

The ordinance is not invalid on constitutional grounds.

(Reply to respondent's Point III, pp. 61-105).

(a) Principles governing the validity of the ordinance under the federal and Illinois due process clauses.

The respondent complains (p. 61) that the petitioners cite "very few Illinois cases" on the question of the reasonableness of the ordinance. The respondent overlooks the Illinois cases cited on pages 38 and 39 of the petitioners' brief all dealing with the reasonableness of regulations passed to protect the public health. In *Koy* v. *City of Chicago*, 263 Ill. 122, 130 (1914), the Illinois Supreme Court said that the regulation of the sale of milk *"is an imperative duty which has been universally recognized," there being no article of food whose impurity may "more quickly, more widely and more seriously affect the health of those who use it."* This duty was said to include requirements that "the receptacles in which milk is contained . . . be of prescribed character." While the complaint (R. 14) alleges that the ordinance is invalid under the federal constitution, not one decision of a federal court is cited in support in the respondent's brief.

The latest decision of the Illinois Supreme Court cited in the briefs on the question of the reasonableness of health regulations shows that the Illinois courts apply the same principle in determining the "reasonableness" of a health ordinance under the Illinois constitution as is applied in federal courts. In *People* v. *Quality Provision Co.*, 367 Ill. 610, 614 (1938), a regulation forbidding the addition of sodium sulphite to sausage as a preservative was upheld on the ground that it was within the power of the legislature to "declare sulphurous acid and its derivatives adulterants and forbid their use in food products" (p. 615). Indicative of the application by the Illinois Supreme Court of the same principle applied in federal courts was a long quotation in the opinion from the opinion of this court in *Price* v. *Illinois*, 238 U. S. 446, 451, 452 (1915), where it was said that a health restriction was a matter for the legislative judgment unless the article prohibited

> ". . . indubitably must be classed as a wholesome article of commerce so innocuous in its designed use and so unrelated in any way to any possible danger to the public health that the enactment must be considered as a merely arbitrary interference with the property and liberty of the citizen."

The respondent has not presented the evidence required by this principle. The master, who heard the numerous expert witnesses testify, found that there was evidence in the record *from the respondent's own witnesses*

> ". . . from which the City Council could reasonably have concluded that prohibition of paper containers was necessary and appropriate to protect the purity and wholesomeness of milk" (R. 1734).

Similarly the majority opinion of the Circuit Court of Appeals said:

> "It is true the record discloses some evidence in support of defendants' contention that the use of such containers presents a hazard to health" (R. 1794).

And the opinion of the dissenting judge said similarly:

> "The master found upon substantial evidence a number of facts bearing upon the undesirability of the use of paper milk bottles, showing clearly that at least the question of desirability of their use is debatable" (R. 1796).

This evidence is discussed at length in the petitioners' brief (pp. 40-69). Under the applicable principles of constitutional law, applied by the Illinois courts as well as by the federal courts, it is clear that the ordinance forbidding the use of paper milk containers is not invalid.

The respondent's brief cites only two Illinois cases in which public health regulations were held invalid as discriminatory and unreasonable under the Illinois constitution. The cases are *People* v. *Carolene Products Co.*, 345 Ill. 166 (1931), and *Carolene Products Co.* v. *McLaughlin*, 365 Ill. 62 (1936) (respondent's brief, p. 63). In these cases statutes forbidding the sale of "filled milk" (skimmed milk to which fat or oil other than milk fat, such as coconut oil, has been added) were held invalid. As noted in *People* v. *Quality Provision Co.*, 367 Ill. 610, 615 (1938), the prohibitions in the *Carolene Products Company* cases were invalid because the thing sought to be condemned by the legislature was the sale of a known wholesome food. It was even stipulated in the case that the product involved was wholesome. In the case at bar, both the master and the Circuit Court of Appeals pointed out that the evidence shows that there are public health hazards in the use of paper milk containers. In *People* v. *Price*, 257 Ill. 587 (1913), also cited by the respondent, the public health regulation was upheld and the decision of the

Illinois Supreme Court was affirmed in *Price* v. *Illinois*, 238 U. S. 446 (1915).

The respondent does not attempt to differentiate the many cases cited in the petitioners' brief (pp. 36-40) upholding a great variety of public health regulations imposed under the police power. We emphasize particularly *Pacific States Box and Basket Co.* v. *White*, 296 U. S. 176 (1935),* holding valid a requirement that raspberries and strawberries be packed only in certain containers, and *Koy* v. *City of Chicago*, 263 Ill. 122 (1914), upholding the validity of an ordinance requiring the use of a certain apparatus for recording the temperature of milk during pasteurization.

(b) Evidence in the record shows that the prohibition of paper containers for delivering milk is not unreasonable.

(Petitioners' brief, pp. 40-68; respondent's brief, pp. 70-90.)

Before discussing the subdivisions of this point, we have several general comments to make on the respondent's discussion of the evidence.

The respondent's emphasis on the testimony of Dr. Lloyd Arnold.

Throughout respondent's discussion are many references to the testimony of Dr. Lloyd Arnold, a witness for the petitioners. His qualifications and his testimony were noted in the petitioners' brief (appendix C, pp. 98-99). An entire page in respondent's brief (pp. 93-94) is de-

*The opinion (pp. 183-184) completely answers the respondent's vague claim (brief, p. 64) that the Chicago ordinance "fosters monopoly."

voted to an attempt to belittle his testimony. The record contains a complete answer.

The characteristics of paper containers that create public health hazards are proved in the record, not merely by the testimony of Dr. Arnold, but by the testimony of *respondent's own witnesses.* In discussing the evidence about the reasonableness of the ordinance, the petitioners' brief relied almost entirely on the testimony of respondent's witnesses because it was unnecessary to rely on Dr. Arnold's testimony. Now the respondent, instead of replying to the petitioners' discussion of respondent's own evidence, attempts to discredit Dr. Arnold's testimony. Throughout his testimony (R. 1061-1201) he stated his opinion to be that there were public health hazards in the various materials used in paper containers and in the various processes in their manufacture. The master in his report concluded that the reasonableness of the ordinance was supported by "evidence in the record, from plaintiff's own witnesses, independent of the corroborative testimony of Dr. Arnold."

The record contains abundant proof of the unusual qualifications of Dr. Arnold to testify about paper milk containers. His qualifications as shown by the record are noted in petitioners' brief (p. 98). We call particular attention to the facts that since 1927 Dr. Arnold has been a full professor in charge of the department of bacteriology and public health at the University of Illinois College of Medicine, and has acted as consultant to the Illinois State Department of Public Health. He has personal knowledge of the various processes involved in the manufacture of paper, for since 1928 he has been a consultant on the bacteriological problems involved in paper manufacture for the Kimberly-Clark Corporation, a manufacturer of a

variety of paper products (R. 1101). And during 1938 he became familiar with the processes in the manufacture of the paper used in paper milk containers, in the work done by him for the Sealrite Corporation (R. 1096, 1102).

The only other witness with approachably similar knowledge of paper manufacture was respondent's witness Dr. John Sanborn. Doctors Prucha and Tracy had made only brief visits to paper mills (R. 475, 512). Respondent's witnesses Tonney, McNally, Orvis, Woodman and Packer—all of them gave opinions about the sanitary aspects of paper containers—had never visited paper mills. Also Dr. Arnold was the only witness with medical training who had personal knowledge of paper manufacture. The respondent's witnesses Sanborn and Prucha, who had some knowledge of paper manufacture and had conducted experiments on paper milk containers, are bacteriologists with degrees of Doctor of Philosophy. So Dr. Tracy is a Doctor of Philosophy, a "dairy manufacturist" (R. 533). The witness Tonney, a doctor of medicine, had never visited paper mills (R. 921).

Paper milk containers do not promote health.

The respondent asserts that paper containers "promote health" and are "wholesome", as if they possessed health-giving properties of some kind. There is no evidence in the record to support this.

With all the possible health hazards in the use of paper containers as noted in the petitioners' brief (pp. 44-68), paper containers have but one minor advantage over glass containers from the standpoint of health. This advantage is in the delivery of milk to residences where there is a contagious disease. Paper containers are single-service containers which are thrown away by the consumer after use. Glass containers are collected from consumers and

re-used. If there is a contagious disease at a consumer's house, the possible danger with glass containers is that the person collecting and handling the used bottle before sterilization may deposit elsewhere bacteria that he may have picked up from the used bottle. The danger is thus not to the people in quarantine but to others, and consequently the last paragraph of section 3094 of the Chicago ordinance (R. 109, last paragraph) provides that milk bottles shall not be taken from quarantined premises "during the period of quarantine or thereafter, until said bottles or containers have been sterilized, and permission has been granted by the Board of Health for the removal of same." With a single-service container the same problem exists because, when the paper container is thrown away, it is collected and handled by garbage collectors who may spread the contagion. Admittedly this danger may not be as great as the danger with glass containers handled by people delivering milk. Even so, this slight advantage of the paper over the glass container involves only an infinitesimal part of the total amount of milk delivered in Chicago and is outweighed by the hazards of paper containers to consumers at large. It does not show that the City Council is unreasonable in forbidding the use of paper containers in the delivery of the 1,300,000 quarts of milk daily consumed in Chicago.

Other statements in respondent's brief not supported by the record.

Apparently in the belief that arbitrary action by the Chicago Board of Health would affect the reasonableness of the ordinance, the respondent says (p. 62) that the record shows:

> ". . . that the board of health of the City of Chicago made no effort whatever to ascertain the sanitary

properties of single service containers until almost a week after this suit was filed''

and R. 1003 is cited in support. The record refers only to testimony of the chief chemist of the board that he started making *tests* of paper milk containers in February, 1939 when the suit started. This does not show that ''no effort whatever'' was made before that time to ascertain the sanitary properties of paper containers; and, while the question was not in issue at the trial, the record incidentally shows the contrary. In 1937 Paul F. Krueger, chief sanitary officer of the board, made a trip to Urbana, Illinois, with a bacteriologist of the board to inspect paper containers and the filling machine used in the Department of Dairy Husbandry of the University of Illinois (R. 987). At conferences held at Geneva, New York, in 1937 and 1938 on the sanitation of paper milk containers, someone attended on behalf of the board (R. 191-192).

Other investigations of paper milk containers also came to the board's attention. On December 4, 1937 Dr. Lloyd Arnold made a report about paper milk containers to Dr. Herman N. Bundesen, president of the board (plaintiff's exhibit 4, R. 1397-1469). The report began by stating, ''cardboard of a satisfactory standard quality can be obtained and used for this purpose'' (i.e., in milk containers), and concluded, ''from my personal investigations and observations I see many advantages to single service paraffin coated milk containers for fresh fluid milk'' (R. 1398-1399). Dr. Arnold testified in this case that this was merely a preliminary report (R. 1149-1150) and that he later changed his opinion* about the advantages of paper

*Dr. Arnold's opinion that the paper milk container is not satisfactory from a public health point of view was affected by his consulting work done in 1938 for Sealrite Corporation, Fulton, New York, a manufacturer of paper milk containers; he advised the Sealrite Corporation of his conclusion that they are unsatisfactory (R. 1103-1104, 1201).

milk containers (R. 1103). In the spring of 1938 Dr. Arnold performed tests on the bactericidal effect of paraffin and sent the results of the tests to the board of health (R. 1131). During March and April of 1938 Dr. Arnold investigated paper containers further and found all of them to show the same type of absorption and during the last of April or in May, 1938 reported to Dr. Bundesen of the board that single service containers for milk might not be authorized safely by the City of Chicago (R. 1121-1122). Speaking of his earlier report, Dr. Arnold testified, "there are factors I did not know anything about that are operating that should be included in considering the sanitary standards of the paper container" (R. 1149). The above testimony in the record completely disproves the respondent's statement that the board of health "made no effort whatever" to ascertain the sanitary properties of single-service containers before the suit was filed.

The respondent says (pp. 68-69) that paper containers are used for a number of products in Chicago "without restriction, inspection or regulation" and R. 694 is cited in support. The record shows merely that paper containers are used for the purposes mentioned without "any objection" by the board of health and that tests are not conducted by it to determine their sanitary quality. This does not mean that other inspection devices are not used or that these containers are used "without restriction, inspection or regulation."

The respondent (p. 69) makes the amazing statement that the evidence proves "that the single service container in question has not at any place or at any time been *even suspected* of constituting a health hazard." The following articles by the respondent's own witnesses show great concern over the public health hazards in the use of paper milk containers:

"Reasonable Sanitary Standards for Paper Products," Sanborn (plaintiff's exhibit 17, R. 1507-1511).

"Sanitary Aspects of Paper Milk Containers," Prucha (plaintiff's exhibit 62, R. 1591-1599).

"Are Paper Milk Containers Sanitary?" Prucha (plaintiff's exhibit 63, R. 1600-1604).

"Microbiology in Pulp and Paper Manufacture," Sanborn (defendants' exhibit 2, R. 1665-1670).

1. Paper milk containers are not sterile when formed and do not receive effective bactericidal treatment before they are filled with milk.

(Petitioners' brief, pp. 44-47; respondent's brief, pp. 70-74.)

The respondent does not deny the *facts* stated in the petitioners' brief on this point.

The respondent does not answer the petitioners' argument that the lack of sterility coupled with he absence of bactericidal treatment before use shows that it is not unreasonable to prohibit the use of paper containers. If paper containers were sterile when manufactured (as the glass container is) or if they received effective bactericidal treatment before use (as the glass container does), there might be some ground for the claim of unreasonableness; and so the complaint in this case, which alleged that paper milk containers were sterile, may not have been subject to a motion to strike. But the combination of these two factors—whatever the evidence may be about the sanitary quality of the respondent's and other paper containers at the time of the trial—shows that there are new dangers present in their use, dangers which the City Council deemed sufficiently great to require the prohibition of their use. Aside from the real danger in their use as indicated by the evidence, the mere possibility of danger is enough to

place the matter within the discretion of the legislative body.

The respondent says (p. 73) that all its expert witnesses "were unanimous that health authorities possessed as adequate bacteriological control over paper milk bottles as they had over glass bottles." Record references are not given. We note some of the testimony apparently relied on.

The tests made by the witness Orvis on milk in glass and paper containers were made on milk from different milk plants, as the witness admitted ("I have no comparison of glass out of the same plant" R. 570), and his testimony was objected to on that ground (R. 571). Obviously the difference in the milk rather than in the containers may have accounted for the higher bacterial content of the milk in the glass containers. The testimony of this same witness about the comparative problems in glass and paper containers was of no probative value: "I *think* our problems in glass are greater, *from my limited experience so far*, than those in paper" (R. 605).

The opinion of the witness Tonney (R. 910) that the paper container represents a distinct advance over the glass milk container in the sanitary sale of milk must be considered in the light of his qualifications. He had had no personal knowledge of any of the various processes in the manufacture, converting, or filling of paper containers, except for visits of a half-day each to two dairies using paper containers (R. 921, 922, 925).

The respondent says (p. 71), citing R. 406-7 and 424, that the witness Riee "found the paper bottle superior to the glass bottle in abating the spread of infectious diseases." In his testimony this witness did state what he thought were some advantages of paper over glass containers. He mentioned the following as one:

> "the fact that the bacteria count is often housed up in it, so that the bacteria count are comparable or *sometimes* superior *if the sterilization of the glass container is not* adequate." (R. 407; Italics added.)

Obviously a particular paper container may be more sanitary than a particular glass container that has not been properly cleaned.

As the above comments show, the respondent's statement that paper containers are more sanitary than glass is not supported by the evidence apparently relied on by the respondent. Some of these witnesses based their opinions on their experiences with glass containers in places other than Chicago. The petitioners' brief (pp. 70-73) pointed out that experience elsewhere does not determine the questions at issue here. We note, however, that in places where adequate sanitary control of glass containers is not practiced the paper container may seem superficially to be an easy solution to the problem of obtaining sanitary milk containers. As the above quotation from the witness Rice shows, the bacteria count in paper containers may be less than in glass containers that are not adequately sterilized. Admittedly the paper container eliminates the problem of supervising the process of cleaning used containers. The evidence in the record here shows, however, that the paper container creates the new problem of supervising the sanitation of the many processes in its manufacture.

2. Paper containers are absorbent.

(Petitioners' brief, pp. 47-51; respondent's brief, pp. 70-74.)

The respondent minimizes the absorption of milk by the paper in its container, although, as noted in petitioners' brief, the respondent thought it sufficiently important in its

complaint to allege repeatedly that its containers are non-absorbent. The respondent says (p. 70) that only "a few drops" of milk are absorbed. This is hardly supported by the record, for the respondent's witness Prucha found the amount of absorption to be forty drops per quart container in forty-eight hours (R. 716). This is not a small amount for a container that is often used in the household for storing milk, particularly when it is remembered that Chicago's daily consumption of milk is 1,300,000 quarts. But of course the primary objection to absorption is that *absorption permits whatever is in the paper to get into the milk.*

The respondent attempts to answer this point by saying that the absorption is immaterial because there are no harmful bacteria in the paper in the container. And in support of this statement the testimony of numerous witnesses is relied on. For example, the respondent says (p. 71) that in the opinion of the witness John R. Rice "supported by research, absorption of milk in the paper board presented no health problem" and R. 425 is cited in support. The same witness testified that *if* the paper board is free from bacteria, absorption does not present a health problem (R. 412). With this testimony the petitioners may agree. But the record does not show that the paper used in paper milk containers, even the paper in respondent's container, is free of bacteria or of harmful bacteria. Any container that contributes bacteria *of any kind* to milk is undesirable. The respondent's witness Sanborn, writing in 1938, said that "the types of organisms *predominating* in milk container board are heat-resistant forms," implying that other forms are also present. He continued,

> "While these species are clearly not disease-producing types, it is desirable from the standpoint of general sanitation and cleanliness to hold their total numbers

to a minimum in paper to be used with perishable foods." (R. 1514.)

The respondent speaks (p. 71), of the "haphazard *inspection* of glass bottles by the petitioners, (1400 bottles being *inspected* over a period of a year—)." The record reference (R. 986) shows that the testimony was about 1400 bottles *tested* in a year. Tests of the bottles themselves are but one of the inspection devices employed in Chicago. The bottling plants themselves are inspected in detail regularly ("once or twice a week, but at least every two," R. 970-2).

The witness John R. Rice is said (respondent's brief, p. 71) to have testified that he never "found any pathogenic bacteria on any paper board used in paper milk bottles." He also testified that the paper *was not tested for pathogenic bacteria*, the only basis for the testimony quoted by the respondent being that the "gross appearance" of the bacteria "was not of pathogenic forms" (R. 413).

The witness Woodman is said by the respondent (p. 72) to have testified that "in his experience disintegration tests offered adequate protection at all times and his experiments showed that the empty paper container was essentially free of bacteria in 300 to 400 tests." The record reference (R. 680) does not bear out the statement about disintegration tests; and indeed the witness stated he "did not ever conduct any disintegration tests" and that no one connected with the Evanston Board of Health (Woodman's employer) had ever done so (R. 682). Also, while at one point Woodman said that he found the paper containers "free of bacteria" (R. 680), he admitted immediately thereafter (R. 681) that his regular rinse tests showed 7% of the containers to have more than 1,000 bacteria per container.

The respondent says (p. 73) that the United States Public Health Service "recommends the use of single-service containers." As noted elsewhere, the only "recommendation" is found in the provision in the model ordinance regulating their use (R. 1678). The Health Service has called particular attention to the "porous condition" of paper containers as "undesirable" (petitioners' brief, p. 48).

3. Paraffin from paper containers gets into the milk placed in them.

(Petitioners' brief, pp. 51-53; respondent's brief, pp. 74-77.)

The plaintiff says (p. 25) that there is no evidence tracing any disease or illness to the paraffin from paper containers that gets into the milk. The petitioners' brief (pp. 52-53) cited cases holding that the adulteration of milk may be forbidden even though the adulterant is not harmful to health. These cases are not mentioned by the respondent.

The respondent also (pp. 74-76) stresses testimony that paraffin is not a poison and that particles of it may be swallowed without ill effects. This does not mean that it is not undesirable for children to take paraffin as a part of their regular diet, as shown by the testimony of Dr. Black discussed in petitioners' brief (p. 52). In *People* v. *Quality Provision Co.*, 367 Ill. 610 (1938), where a statute declared the addition of any derivative of sulphurous acid to food to be an adulterant, it was held valid to prohibit the use of sodium sulphite, a derivative of sulphurous acid, as a preservative in sausage, although the testimony showed that sodium sulphite is used medicinally (see opinion, p. 611).

The respondent contends that the provision of the Illinois Criminal Code cited by petitioners (brief, p. 53) has no bearing on this case. Admittedly the respondent is not being prosecuted here for violation of the criminal code. The broad language of the section—prohibiting the addition of *any* foreign substance to milk—indicates the great lengths to which the Illinois legislature has gone in protecting the milk supply from foreign substances.

4. Odors from paraffin and bacteria in paper containers are imparted to the milk.

(Petitioners' brief, pp. 53-56; respondent's brief, pp. 78-81.)

The petitioners stated (brief, p. 54) that the act of the respondent's witness Dr. Sanborn in smelling a container and the witness's testimony about this proved that the paraffin in paper containers has an odor. This undisputed fact is not disproved by pointing out, as the respondent does (brief, p. 78), that Dr. Sanborn testified that he did not know at what temperature paraffin oxidizes and becomes rancid. A fact is not disproved by showing that a witness did not know why the fact occurred.

While the petitioners may not have produced a witness to testify here that in his experience paraffin and bacteria contribute odors to the milk in paper containers, the evidence discussed in the petitioners' brief shows that paraffin and bacteria *may* contribute odors to the milk. This alone is enough to form a basis for a controlling legislative discretion.

The respondent notes (p. 79) that the testimony of its witness Peterson, who testified about paraffin, was "uncontradicted and unimpeached." This is so only if the testimony of respondent's witnesses Keyser (R. 1347-8) and

Sanborn (R. 303-304) is disregarded. Peterson has "served as salesman, engineer and technical engineer" for the Standard Oil Company of Indiana, which manufactures the paraffin used in paper milk containers (R. 942-3). The tests he described (and on which the respondent relies, p. 79) were made to convince the Ex-Cell-O Corporation to use his company's paraffin (R. 944).

5. Effective sanitary control of paper containers requires supervision and control of all processes in the manufacture of paper and its conversion into containers.

(Petitioners' brief, pp. 56-67; respondent's brief, pp. 81-86).

The fundamental error in the respondent's discussion of the point is seen in the statement,

> "The evidence is undisputed that the public health authorities have just as much control over the sanitation of the paper milk container after it reaches the confines of the City of Chicago where it is subject to physical and chemical tests as they have over glass milk bottles * * *." (Respondent's brief, p. 85.)

One basic fact about the sanitation of glass containers is that they not only are absolutely sterile when manufactured (R. 169) but receive bactericidal treatment before each use and with the best method of sterilization it is possible to obtain a sterile glass bottle "according to bacteriological tests" (R. 170). The bactericidal treatment at the local dairy can be thoroughly inspected and controlled locally and, as shown in the petitioners' brief (pp. 60-61), this is done in Chicago. Aside from the application of hot paraffin, which "is not an effective sterilizing agent" (R. 194), there is no local bactericidal treatment of paper containers.

The respondent describes (p. 82) the testimony of Prucha as "forceful and persuasive that the mere passage of time is a great purifier, particularly with respect to the harmful type of bacteria," and cites plaintiff's exhibit 46 (R. 1572). This exhibit represents a test made on September 6, 1939 (R. 632), and was testified about (R. 632-40) on September 12, 1939. The test purported to show that bacteria with which paper is innoculated are completely absent in nine hours as the result of a "self-purification" process, and that they are almost all killed in 60 minutes (R. 1572). Dr. Prucha testified, however, that he only tested the samples for the prodigiosus bacteria with which the paper was innoculated, and that "there were other types of non-spore-forming bacteria present in the paper after the expiration of the periods of time described in that exhibit"; the non-spore-forming bacteria are the more dangerous type (R. 780). Dr. Prucha's own testimony thus shows that plaintiff's exhibit 46 is not persuasive evidence of what it purports to prove.

The respondent also (p. 84) refers to testimony by Dr. Prucha that "by his bacteria counts on paper board he could determine whether it would be fit to be used for milk containers." The record reference (R. 838) shows that the particular counts referred to were those shown in defendants' exhibit 7 (R. 1671). Out of 70 samples of paper to be used for paper milk containers, 42 contained more bacteria than the standard of the United States Public Health Service of 100 per gram (R. 792-3). Obviously a high count of bacteria would indicate that the paper was not fit for milk containers. What makes the tests unreliable is that an inaccurate *low* count would indicate that the paper was fit for milk containers. There appears to be a clear conflict in the testimony of Dr. Prucha about the necessity of inspect-

ing paper mills. (Cf. petitioners' brief, p. 58, and respondent's brief, p. 84.)

The respondent (pp. 83-84) relies on testimony of the witnesses Orvis, Tonney, and Woodman that they did not believe inspectors had to visit paper mills. And the respondent says that Tonney was "thoroughly familiar with . . . the paper bottle operations" (p. 83). Tonney had never visited a mill making paper for milk containers (R. 921) or a converting plant (R. 922), and his knowledge of the filling of paper containers was based on visits of a half day each to two dairies (R. 925). The witness Orvis testified that he had never been in a paper mill (R. 573). The witness Woodman, when asked about operations at a paper mill, said, "I will have to tell you that I know nothing at all personally about any of that at the plant" (R. 684).

6. Paper containers are not transparent and cream does not rise to the top in them.

(Petitioners' brief, pp. 67-68; respondent's brief, pp. 86-90.)

The respondent (p. 88) refers to the witness Orvis as having testified that "the cream line does not necessarily determine the amount of butter-fat in particular milk." His testimony (R. 573) does not go as far as the respondent indicates:

> "You may get types of milk in which the cream line may not be very clear, but it is *generally* a comparable basis and not an absolute basis." (Italics added.)

The plaintiff does not refute this argument by pointing out (p. 87) that homogenized milk is permitted to be sold in Chicago. As shown by the definition quoted by the plaintiff, homogenized milk is mechanically treated for the very purpose of diffusing the cream throughout the milk. Also,

the stipulation in the record includes a fact not mentioned by the plaintiff: *the homogenized milk being sold is labelled and sold as such* (R. 1332).

(c) Factors relied on by the District Court and in the majority opinion of the Circuit Court of Appeals are not controlling.

(Petitioners' brief, pp. 69-78; respondent's brief, pp. 90-104).

Weakness of presumption that ordinance is valid.

In attempting to support the dictum in the majority opinion of the Circuit Court of Appeals that the presumption of validity is "little more than a shadow," the respondent overlooks the fact that the presumption is in reality a self-imposed restriction, applied by the courts under the doctrine of the separation of powers, to avoid interference with the function of the legislature. It is a presumption of law and operates whether or not there is evidence that the members of the legislative body actually considered the factors that would support the validity of their action. Consequently the time element is of no importance.

Use of paper milk containers elsewhere.

The petitioners' argument is that on the facts and under the law the use of paper milk containers elsewhere is immaterial. The respondent attempts (brief, pp. 91-92) to answer this contention by referring to the testimony of health officials of Chicago suburbs about the use there of paper containers and by quoting at length in its brief (pp. 96-99) a number of letters from health officials about paper milk containers. The respondent does not deny that the record shows, as pointed out in the petitioners' brief (pp.

71-73), that the precautions taken in some municipalities as to paper milk containers are in fact very inadequate.

This is true also of the testimony to which the respondent now refers (pp. 91-92). For example, respondent cites the testimony of Woodman, an Evanston health official, that he did not consider it necessary to inspect paper mills or fabrication plants (R. 675). The same witness testified that he had never been to a paper mill where paper milk containers are made (R. 684). Respondent says that Evanston made 300 to 400 tests "*before* use of the paper bottles was permitted." The record shows that the tests, which were merely rinse tests, were made *after* the use began (R. 679-680) and the samples tested were not picked at random but were submitted by dairies (R. 673, 680). Woodman testified that paper containers were being used in Evanston without any regulations whatsoever pertaining to their manufacture and handling (R. 684). He also testified that, while tests were made, they did not "test the quality of the paper at all" (R. 684). Similarly the respondent refers to the opinion of Orvis, health officer of other Chicago suburbs, that the bacteriological control of paper containers equals that of glass. This witness had never been to a paper mill where paper containers are made (R. 583-584), although the respondent's witnesses Sanborn and Prucha state that milk sanitarians should inspect paper mills (petitioners' brief, pp. 58-59). In the municipalities for which Orvis was health officer paper milk containers had been in use for some time at the time of the trial and none of them had regulations concerning the manufacturing of the paper (R. 580). The respondent points out that these municipalities were sent monthly reports on the bacterial content of paper board by a Dr. Jordan and R. 583 is cited in support. Orvis testified at first that Dr. Jordan

himself selected the samples of paper for testing, but he later admitted that the source of information on this fact was a man at the plant of the Fieldcrest Dairy (R. 588-589). The testimony relied on by the respondent does not show that municipalities permitting the use of paper milk containers exercise proper sanitary supervision over them.

Experience elsewhere is a matter addressed to the discretion of the legislative body. Even if convincing evidence had been presented that health officers where paper containers are used can and do exercise adequate sanitary control over them (and the evidence here is otherwise), the court would be going far afield in making an investigation of the experience everywhere in order to determine the reasonableness of the ordinance. Yet this was the factor on which the majority opinion of the Circuit Court of Appeals relied in indicating that the ordinance is unreasonable.

The respondent says (p. 92) that the "daily sale of milk in single-service paper containers in Chicago by restaurants and drug stores was not actually prohibited or interfered with by the City or its Board of Health at any time" and R. 940 is cited in support. The reference is to the testimony of Frank H. Bergman, the manager of a restaurant in Chicago. His testimony was very brief. After identifying a paper container, he was asked if he had received "any instructions from the Board of Health of the City of Chicago that you are not to use these paper containers in the sale of milk." The witness' answers were: "Never that I know of"; "I don't remember"; "That would go to our main office"; "No, I could not tell you of any" (R. 940). This testimony clearly does not support the respondent's statement. And the regulation of the Chicago Board of Health, quoted in petitioners' brief (p. 77n), shows that the sale of milk in paper containers by restaurants and drug stores is prohibited.

The letters quoted in the respondent's brief (pp. 96-99) from health officials obviously were incompetent evidence. The letters contained opinions of the writers and were hearsay.

Respondent (p. 101) quotes from the opinion in *Standard Oil Co.* v. *City of Marysville*, 279 U. S. 582 (1928), and implies that the following quotation does not state the Illinois law:

> "We may not test in the balance of judicial review the weight of sufficiency of the facts to sustain the conclusion of the legislative body."

This same principle was stated by the Illinois Supreme Court in *People* v. *Price*, 257 Ill. 587 (1913), quoted recently in *People* v. *Quality Provision Co.*, 367 Ill. 610, 614 (1938), the court saying of a disputed question of the reasonableness of a health regulation:

> "In such cases in enacting legislation in the exercise of the police power of the State the legislative declaration that it is unwholesome must be accepted by the courts, and they will not investigate the facts for the purpose of determining whether the declaration of the legislature was warranted by the facts."

The respondent says (p. 102) that the distinctions between milk and other foods packaged in paper containers are "superficial." This was not the opinion of the respondent's leading witness Sanborn when he said that milk was the most perishable and easily contaminated food that is placed in paper containers (R. 1495). Nor was it the view of the Illinois Supreme Court when it said in *Koy* v. *City of Chicago*, 263 Ill. 122, 130 (1914),

> "There is no article of food in more general use than milk; none whose impurity or unwholesomeness may more quickly, more widely and more seriously affect the health of those who use it."

Here again the respondent says (pp. 102-103) that the Chicago Board of Health "has made no effort to prevent" the practice of the sale of milk in paper cartons by soda fountains and restaurants. Any sale so made violates a regulation of the board (R. 1697).

IV.

The respondent's paper containers are not "standard milk bottles".

(Reply to respondent's Point IV, pp. 106-115.)

There is a preliminary procedural question about the raising of this point by the respondent. The Circuit Court of Appeals held (opinion R. 1784-1788) that the trial court erred in holding, contrary to the master, that the respondent's paper container is a standard milk bottle. This required a modification of the trial court's decree and the judgment of the Circuit Court of Appeals (R. 1797) was that the cause should be remanded to the District Court "for the sole purpose of modifying the decree so as to conform with the views expressed in the opinion of this court." The decree of the trial court (R. 1759-1760) contained a declaratory judgment that "the plaintiff's Pure-Pak single service paper milk bottle is a 'standard milk bottle' and that the same conforms with the city ordinances of the City of Chicago." On remandment of the cause, this declaratory judgment would have to be modified. In this court the respondent (without having filed a cross-petition for certiorari) now argues that the holding of the Circuit Court of Appeals on this point was erroneous. In this state of the record it may be that the respondent is not in a position to object to that portion of the decree unfavorable to it. The cases seem to indicate that this court exercises a wide discretion in considering objections urged by

respondents. See *Langnes* v. *Green*, 282 U. S. 531, 537-539, (1930); *Letulle* v. *Scofield*, 308 U. S. 415, 421-422 (1939).

In view of the fact that the construction of the ordinance is a peculiarly local question, it would seem that there is a good reason for this court not to review the ruling of the Circuit Court of Appeals. Nevertheless, we do not urge this court to rule one way or the other on the procedural point and we proceed to argue the question on the merits.

• • • • • • •

The respondent seems to think that the case of *City of Chicago* v. *Ben Alpert, Inc.*, 368 Ill. 282 (1938), is inconsistent with the case cited by the Circuit Court of Appeals, *People* v. *Barnett*, 319 Ill. 403 (1926) and that the later case alone destroys the construction of the ordinance by that court. The cases are not inconsistent.

In the *Barnett* case a statute passed in 1887 when only men had the right to vote provided that jurors should be chosen from a list of "electors." Later when women were given the right to vote in Illinois, a woman sought to compel the jury commissioners to list her as a juror. It was held that the Illinois legislature, in using the word "electors" in 1887 meant only male electors, the opinion saying (p. 410):

> "The legislative intent that controls in the construction of a statute has reference to the legislature which passed the given act (25 R.C.L. 1029). Applying the rule of construction therein mentioned, it is evident when the legislature enacted the law in question, . . . it was intended to use the words 'electors' and 'elector' as the same were then defined by the constitution and laws of the State of Illinois. At that time the legislature did not intend that the name of any woman should be placed on the jury list, and must be held to have intended that the list should be composed of

> the names of male persons only. *In interpreting a statute the question is what the words used therein meant to those using them.*" (Italics added)

In considering a similar question in *Commonwealth* v. *Welosky*, 177 N. E. 656, (1931) Mr. Chief Justice Rugg said (p. 659):

> "General expressions may be restrained by relevant circumstances showing a legislative intent that they be narrowed and used in a particular sense."

In the *Barnett* case the general expression "electors" was restrained by the circumstance at the time of its use that only men had the right to vote. In the case at bar, if the term "standard milk bottles" considered out of its context is a general expression, the circumstance that in 1935 milk had been delivered for decades in glass containers of a typical shape called "milk bottles" shows a legislative intent that the term was used in a particular sense to mean the typical container known to the City Council. This is apparent from the discussion below of the meaning of the term.

In the *Ben Alpert* case the word involved was the word "garages" used in a 1911 Illinois Statute (Ill. Rev. Stats. 1937, par 65.81, p. 353) that gave the city power:

> "To direct the location and regulate the use and construction of breweries, distilleries, livery, boarding or sale stables, blacksmith shops, foundries, machine shops, garages, laundries, and bathing beaches within the limits of the city or village."

The question presented was whether or not an open-air parking space or, what was commonly known, as the court said, as "an open-air garage," was within the grant of regulatory power. What the statute did was to authorize the regulation of the *businesses* mentioned in the statute. The

purpose of the statute was not to provide for regulation of structures or premises wherein the businesses were carried on, but of the businesses themselves. In other words, in using the word "garages" in the 1911 statute the legislature did not mean a particular type of structure or particular premises then used as garages, but the garage business as it then existed or as it might exist in the future, whether carried on inside or outside of a structure. In the *Ben Alpert* case the court followed the rule of the *Barret* case —it considered "what the words used therein meant to those using them." The legislature used "garages" in a broad sense. The Chicago City Council, in using the words "standard milk bottles," did not have a similar intention. Obviously there would be no point in an ordinance imposing sanitary requirements to say that whatever has any widespread use in the future may be permitted. Moreover, the evidence in this case shows that paper milk containers had not come to be known as "milk bottles" at the time of the trial. It was an admitted fact in the *Ben Alpert* case that the word "garages" at the time of the trial included open-air parking spaces in common acceptation.

* * * * * *

The pertinent language in the Chicago ordinance about the delivery of milk is as follows:

> "Any milk or milk products sold in quantities of less than one gallon shall be delivered in *standard milk bottles;* * * *" (from third sentence of Sec. 3094 of the Revised Chicago Code; R. 108; italics supplied).

The petitioners contend that the Chicago City Council, in using the term "standard milk bottles," did not intend to permit the delivery of milk in paper containers such as the respondent's Pure-Pak cartons. The intention of the City Council was to permit the delivery of milk in quantities of

less than one gallon only in glass containers of the kind described to everyone by the words "milk bottle." As between two glass milk bottles of only slightly different shapes and thicknesses, it may be difficult to decide whether one or the other is a "standard" milk bottle. But there is no difficulty in determining that a paper milk container is neither a standard milk bottle, nor a milk bottle, nor even a bottle.

"Standard Milk Bottles" as a Term of Common Usage.

The ordinance was passed by the City Council on January 4, 1935 (R. 23). At that time (and it is also true at the present time) the use of paper containers for delivering milk was a comparatively recent development. The development began in 1928, and paper milk containers were "rather widely used" in about 1936 (R. 152). In 1938 their use was concentrated in eastern states, with scattering uses elsewhere (see Paper Milk Bottle Map, 1938, R. 1479). For many decades before the passage of the ordinance, milk had been delivered in Chicago in less than gallon quantities in the familiar glass milk bottles, and this was generally true throughout the country.

> (For a photograph of glass milk bottles, some of which are of the shape used in Chicago, see plaintiff's exhibit 14, R. 1495; also see plaintiff's physical exhibits 26 and 27 for quart and pint glass milk bottles R. 277.)

In the common speech of 1935 (and of today), the two words "milk bottle" convey a clear idea of a container of characteristic material and shape, both of which have been determined by the function of the milk bottle as a receptacle for carrying and storing a staple, easily contaminated liquid. The glass material gives the milk bottle an impervious surface which does not absorb the milk and

which is easily cleaned. The cylindrical shape of the bottle, the sloping shoulders, and an adequate mouth make for easy cleaning, but the neck is narrow enough to permit the hand to get a good grip in pouring. So widespread has been the use of the words "milk bottle," as descriptive of this container, that there is no need to resort to lexicons to determine their meaning. Everyone knows how the term is now used and has been used for decades. Everyone—even a three-year old child—would have no difficulty in selecting a milk bottle from an array of different kinds of bottles—beer, medicine, whiskey, wine, and milk.

The history and wide use of this bottle explain the prevalence of the generic term "milk bottle" in common speech. It was in 1884 that the glass milk bottle, similar in shape to those in evidence in this case, was invented by a Dr. Thatcher and placed on the market. This is pointed out in an article, "Few Changes Made in Milk Bottles Since First Marketed in 1884," *The Milk Dealer* (Olsen Publ. Co., Milwaukee), November, 1935, vol. 25, p. 56, where it is also said:

> "An interesting thing noted by all who examine one of the first milk bottles, proudly preserved, is the very small changes that have been made in the form of the bottle in half a century. The glass top and awkward bail have given way to the cardboard or paper cap, metal cap, and hood cap, and the neck has been made more graceful. Some bottles display knobs or flutings to aid in handling or to obtain individual appearance. At least one type of bottle has a neck shaped to make more simple the extraction of the cream but, on the whole, the bottle of today is faithful to the form adopted by Doctor Thatcher."

The United States Biennial Census of Manufacturers, 1935, indicates that milk bottles have constituted a distinct class of bottles and have been produced in great numbers. The

Census divided glass products into three classifications, one of which was glass containers, and milk bottles were listed as one of the classes of glass containers. The Census stated the 1935 production to be 2,123,873 gross of bottles having a value of $10,980,124.

The use of the adjective "standard" before the words "milk bottle" does not expand but merely emphasizes the common meaning of the latter words. Again, everyone is familiar with the word "standard" as descriptive of what is recognized as a familiar type or criterion. In using the word "standard" the City Council thus stressed its intention to describe the milk bottle with which everyone is familiar—that is, made of glass and having the characteristic shape; and certainly not made of paper.

Illustrative of this meaning of the words "standard milk bottles," are many uses (all furnished by the respondent) of the words "bottles," "milk bottles," and "standard milk bottles" in the record in a sense excluding paper containers:

(a) The respondent's witness Tracy, who operates a commercial dairy at the University of Illinois, was questioned about the meaning of the words "standard milk bottle" (R. 499-501). In answer to questions of the master, he said at one point, "The only standard milk bottle is the one that is the standard glass milk bottle, that I know of" (R. 499) and, when asked what was meant by "standard milk bottle" in Chicago, if paper containers were not used there, he replied, "I would expect them to mean a glass bottle" (R. 500).

(b) The respondent's witness Orvis, health officer of Winnetka, Illinois, when asked by respondent's counsel if he knew "*in the trade or in your profession* of anything *commonly* known as a standard milk bottle," replied,

"Standard milk bottle is a *glass* container of specified content and certain labeling" (R. 574; italics supplied).

(c) The respondent's witness Woodman, for many years a health officer in Evanston, where paper containers had been used for several months at the time of his testimony, used the word "bottle" several times to differentiate a glass milk container from a paper milk container (R. 675, 679, 681), with the result that respondent's counsel corrected him (R. 679, 681).

(d) The officers of the respondent itself are apparently accustomed to use the term "bottles" as excluding paper containers, or were so accustomed before the present litigation began. In the original application to the Board of Health for permission to use paper containers, Mr. S. E. Dean (President of the Dean Milk Company, of which the respondent is a wholly-owned subsidiary) wrote on January 13, 1936 that he would like to present to the Board of Health the facts about "delivering milk to the City of Chicago in paper containers *instead of bottles*" (defendants' exhibit 22, R. 1692; italics supplied).

The United States Public Health Service has construed "standard milk bottle" to exclude paper containers. The form of the June, 1939, amendment to the Health Service's model ordinance—adding "or in single-service containers" after "standard milk bottles" (defendants' exhibit 17, R. 1678)—indicates unmistakably that the original language was not believed to include paper containers. The word "bottles" was not changed, nor were the words "including paper containers" added. The use of the connective "or" shows clearly a belief that "standard milk bottles" did not include paper containers. The persistence of this meaning of "standard milk bottles" in common usage is illustrated again in the record by the language of George

D. Scott, sales manager of the manufacturer of machines for filling respondent's container. In a sales letter to the president of the Board of Health, dated August 2, 1938, he said of the Health Service's model ordinance:

> "True, its fundamental principles were written a good many years ago, and *would not include the present, more sanitary milk receptacle—because it was then unknown*" (defendant's exhibit 23; R. 1694; italics supplied).

Common usage alone thus indicates that by "standard milk bottle" the ordinance describes a glass container for milk of the familiar shape, and does not describe a paper container for milk of a novel shape. There could be no better proof of this usage than that in the record—the speech of practical men of experience in the dairy industry, as Tracy, Woodman, Orvis, Dean, and the language used by the draftsmen of milk legislation, including the Advisory Board of the United States Public Health Service.

In construing legislation, there is no need to resort to extraneous aids to construction when common usage indicates the meaning of the language used. In *Sproles* v. *Binford*, 286 U. S. 374 (1931), Mr. Chief Justice Hughes said (p. 393):

> • • • • "The requirement of reasonable certainty does not preclude the use of ordinary terms to express ideas which find adequate interpretation in common usage and understanding. (Citing cases.) The use of common experience as a glossary is necessary to meet the practical demands of legislation • • •."

And in *Sup* v. *Cervenka*, 331 Ill. 459 (1928), the court said (pp. 461-462):

> "It is an elementary rule in the construction of a statute that the intention of the legislature must pri-

marily be determined from the language of the statute itself and not from conjectures *aliunde*. When the meaning of the language is plain and unambiguous and conveys a clear and definite meaning, there is neither necessity nor authority for resorting to statutory construction. If the words of a statute are plain and the legislative purpose manifest, that purpose must be given effect."

Definition of "Standard Milk Bottles" Derived from Lexicons.

The definitions of "bottle" and "standard" in dictionaries strongly support petitioners' contention that paper milk cartons are not included in the phrase "standard milk bottles."

The following-named dictionaries define "bottle" as indicated:

New English Dictionary (Oxford, 1888):

"1. A vessel with a narrow neck for holding liquids, now usually made of glass; originally of leather."

Encyclopedia Americana (1936), Vol. 4, p. 317:

"*Bottle*, a vessel designed to hold liquids, constructed of various materials and in various forms according to the necessities of local manufacture and the demands of the kind of liquid to be enclosed. *It is now understood to mean a vessel made of glass, with a more or less narrow neck and mouth.* In ancient times, however, the bottle was nothing more than a skin of some animal. • • • The ordinary bottle is, however, of glass. *The various bottles used for different well-known purposes are generally distinguished by peculiar shapes and sizes*, as; for example, the English wine, beer, ale and soda bottles, the French champagne, Burgundy and claret, and the Rheinish wine bottles. • • • In 1927 about four billions of bottles and jars were turned out in United States, ranging in size from small druggists' glass containers to bever-

age and *milk bottles,* fruit and pickle bottles, demijohns and carboys." (Italics supplied.)

Webster's New *International* Dictionary (2d Ed., Unabridged, 1937):

"A hollow vessel of glass, earthenware, or the like, usually with a comparatively narrow neck or mouth, and without handles. Bottles of skins of animals, as of goats sewn up in the form of a bag and tied at the neck were used by the Hebrews, and are still in use, esp. among the ruder peoples. *Bottle* is now so loosely used that its limit of application is not well defined; it is generally distinguished from such vessels as the *jug* and *demijohn.*"

Century Dictionary & Cyclopedia:

"1. A hollow mouthed vessel of glass, wood, leather, or other material, for holding and carrying liquids. Oriental nations use skins or leather for this purpose, and of the nature of these wine-skins are the bottles mentioned in Scripture: 'Put new wine into new *bottles.*' In Europe and North America glass is generally used for liquids of all kinds, but wine is still largely stored in skins in Spain and Greece. Small bottles are often called *vials.*"

Funk and Wagnall's New Standard Dictionary:

"1. A vessel for holding, carrying, and pouring liquids, having a neck and a narrow mouth that can be stopped. Specif.: (1) a glass or earthenware vessel, usually with a flat bottom to stand on, a long neck, and a mouth stopped with a cork. (2) a skin for holding wine, oil, etc.: * * * (3) Any of various receptacles serving as a bottle."

New Century Dictionary (1927):

"A vessel, now commonly made of glass, with a neck or mouth that may be closed with a stopper, for holding liquids: * * *."

Webster's New *American* Dictionary (1939):

> "1. A glass container for liquids, having a neck and no handles, and closed with a cork or stopper."

From these definitions, it is apparent that a "bottle" has certain characteristics, as the word is used today: (1) the material of which the vessel is made—glass; (2) the shape of the vessel—a relatively narrow neck and mouth. Paper containers are not made of the material—glass—of which bottles are usually made, or of a material of which bottles have ever been made in the past. And paper milk containers do not have necks.

Paper milk containers are thus excluded by the word "bottle" alone. The exclusion is even more positive when the word "milk" is added, for a paper milk container has no identity in material or shape with the glass vessel used for delivering milk. Under its definition of "milk," Funk and Wagnall's New Standard Dictionary notes: " 'Milk' is the first element in some of self-explanatory compounds; as milk-bottle, milk-can, etc." If paper containers are construed to be bottles, tin cans are bottles, beer cans (for example) are beer bottles, and milk cans are milk bottles.

The dictionary definitions of the word "standard" indicate that, as used in "standard milk bottles," it merely limits the two other words to the meaning of milk bottles of the familiar type. In Webster's New International Dictionary (2nd Ed., Unabridged, 1937), the adjective "standard" is defined in terms of the same word used as a noun:

> "1. Being, affording, or according with, a standard for comparison and judgment * * *."

And the noun "standard" is given the following definitions (among others):

Webster's New International Dictionary (2d Ed., Unabridged, 1937):

> "5. That which is established by authority, custom, or general consent, as a model or example; criterion; test; in general, a definite level, degree, material, character, quality, or the like, viewed as that which is proper and adequate for a given purpose."

Funk and Wagnall's New Standard Dictionary:

> "Having the accuracy or authority of a standard; serving as a gauge, test, guide, or model; hence of a very high or excellent kind or type, as, *standard* scales; a *standard* book.
>
> 1. Any measure of extent, quantity, quality, or value established by law or by general usage and consent; a weight, vessel, instrument, or device sanctioned or used as a definite unit, as of value, dimension, time, or quality, by reference to which other measuring-instruments may be constructed and tested or regulated.
>
> 2. Hence, any type, model, example or authority with which comparison may be made; any fact, thing or circumstance forming a basis for adjustment and regulation; a criterion of excellence; test; as, a *standard* of conduct; a *standard* of test."

The Century Dictionary (1889):

> "3. That which is set up as a unit of reference; a form, type, example, instance, or combination of conditions accepted as correct and perfect, and hence as a basis of comparison; a criterion established by custom, public opinion, or general consent; a model."

In the New English Dictionary (Oxford, 1919) Vol. IX, Part I, p. 816, the adjective "standard" is given the following definition:

> "B.I. i. b. Having the prescribed or normal size, amount, degree of quality," etc.

Thus the adjective "standard" may have a definite meaning: that which is established by custom or general

consent as a model or example or having the normal size or degree of quality. In other words, it means "of the normal, the ordinary, the well-recognized kind." It would perhaps have been sufficient for the ordinance to say simply, "milk shall be delivered in milk bottles," but this requirement was made more certain by the addition of the word "standard," indicating with greater precision that what was meant was the ordinary milk bottle, known everywhere and by everyone as such. Obviously, paper containers do not comply with this standard.

The dictionaries thus confirm the common understanding that the term "standard milk bottles" does not include paper containers. The opposite result can be reached only by a violent misconstruction of language.

Apparently there is but one instance other than in this case where a judicial construction of "standard milk bottle" was sought. In *Uservo, Inc.* v. *Selking*, 217 Ind. 567, 28 N. E. 2d 61 (1940), discussed by the respondent (brief, p. 110), an injunction decree provided that, in the exchange of milk bottles between a bottle dealer and a dairy, the dealer might make up an excess "by delivering standard bottles in good usable shape." A controversy developed about the bottles delivered, the dairy contending that the bottle dealer delivered bottles not standard in that the necks and cap seats were slightly larger than the bottles it had been using. In holding the decree unenforceable because the term "standard bottles" was indefinite, the court said (28 N. E. 2d 63):

> "It will be noted that the phrase 'standard bottle' is not defined in the order. There seems to be no universal or well defined meaning of what does or does not constitute a standard milk bottle. It was contended with much vigor in this case, that what might be a standard bottle in one city in Indiana might not be regarded a standard bottle in another."

There it was obviously difficult to tell, as between glass bottles with slight variations in the neck and cap seat, whether one or the other was a "standard" milk bottle. On the other hand, in the instant case, it is easy to tell that respondent's paper container is not a "standard milk bottle." As to the issues in the instant case, the phrase "standard milk bottle" is not indefinite. Indeed, the *Uservo* case, by illustrating the difficulties in applying the term "standard" to bottles slightly dissimilar, emphasizes the great dissimilarity between respondent's paper container and a standard milk bottle.

Petitioners' contention that the term "standard milk bottles" in the 1935 ordinance does not include paper containers is not based on the ground that paper containers were then unknown to the City Council. The ground is that the City Council in using the term intended to use it in the sense in which it was usually used at that time; and one element in that sense is that the material of standard milk bottles is glass, the result being that paper containers are excluded by the term. This is true even though the existence of paper containers may then have been known to the City Council.

Outstanding in respondent's argument on the construction of the ordinance are two related defects. *There is no discussion whatever of the meaning of "milk bottles" as a separate term.* Also respondent's brief misses the point that we are here seeking the intention of the Chicago City Council in the year 1935 in using the words "standard milk bottles."

In using "bottles" the City Council did not intend to permit the use of a container made of any kind of material that has ever been used or that might possibly be used in a thing termed "bottle," as the trial court in effect held.

The intention must be sought from the sense in which the word is *usually used*, not from the sense in which it might possibly have been used in the past or might possibly be used now. Obviously the City Council is likely to have used the word in the sense in which it was usually used in 1935. All dictionaries, as shown above, say that bottles are usually made of glass and have a narrow neck. Added to this are the facts (a) that the purpose of the ordinance was to fix the kind of container to be used for carrying and storing milk, a purpose for which glass with its impervious surface is peculiarly suited and (b) that the prior practice for decades had been to use glass containers for this purpose. The inevitable conclusion is that the City Council in using the word "bottles" meant glass containers.

But there is an even more serious defect in respondent's argument. The City Council did not use the word "bottles" alone. It used the compound term "milk bottles." In the common usage of the household as well as of the dairy industry, "milk bottle" means a glass container with a characteristic shape. The broad word "bottle"—describing what is and has been *usually* made of glass—is greatly narrowed by putting the word "milk" before it to make the compound term "milk bottle"—describing what has *always* been made of glass. Since the common usage of 1935 and of today attributes a fixed meaning to "milk bottles" (one of the elements being that the material of which they are made is glass), it is clear that the City Council did not intend to include paper containers in requiring milk to be delivered in milk bottles.

The respondent's entire approach to this issue is based on an erroneous conception of the method of interpreting language. Its argument not only disregards the importance of common usage, stressed in the cases cited above, but also disregards the necessity of looking to the circum-

stances surrounding the enactment of the ordinance to determine *the meaning of the words used to the persons using them.* For example, the respondent says (brief, p. 112):

> "We therefore respectfully submit that the question in this case is not what was meant by a 'standard milk bottle' precisely at the time the ordinance was adopted, but what is meant by 'standard milk bottle' at the time the ordinance is being enforced."

The result of respondent's argument on this branch of the case is that "standard milk bottles" means the same thing as "standard milk containers." Section 3094 of the ordinance shows that this is wrong. The complete text of the section is as follows:

> "The sale of dipped milk and milk products is hereby expressly prohibited. All pasteurized milk and milk products shall be placed in their *final delivery containers* in the plant in which they are pasteurized, and all certified milk and milk products sold for consumption in the raw state shall be placed in their *final delivery containers* at the farm at which they are produced. Any milk or milk products sold in quantities of less than one gallon shall be delivered in *standard milk bottles;* provided, however, that nothing herein contained shall be construed to prohibit hotels, soda fountains, restaurants, and similar establishments from dispensing milk or milk products from sanitary dispensers approved by the board of health.
>
> "The delivery of milk and milk products to, and the collection of milk and milk products *containers* from, quarantined residences shall be subject to the rules and regulations of the board of health.
>
> "No milk *bottle* or other *containers* may be taken out of or away from quarantined premises during the period of quarantine or thereafter, until said *bottles* or *containers* have been sterilized, and permission has been granted by the board of health for the removal of same." (R. 108-9; italics added.)

The second sentence contains two uses of the words "final delivery containers," a broad term including receptacles of

any kind of material; and "containers" is also used elsewhere in the section. In the third sentence—the provision of the ordinance involved in this case—the containers to be used for the small quantities of milk usually delivered to homes were described by the narrower term "standard milk bottles.". If the City Council had intended "standard milk bottles" to mean the same thing as "standard milk containers," it would have continued to use the word "containers" in the third sentence as it did in the second sentence and elsewhere, instead of changing to the narrow word "bottles."

An example of the use of "bottles" in a sense excluding paper containers is found in the respondent's brief (p. 28), where item 18 of section 15 of the Illinois Milk Pasteurization Act of 1939 (ch. 56½, secs. 115-134, Ill. Rev. Stat. 1941) is quoted:

> "Item 18. *Bottling or packaging* of milk and milk products shall be done at the place of pasteurization by approved mechanical equipment." (Italics added.)

"Milk Products" are defined in section 1 (b) of the act to include only beverages. The phrase "Bottling or packaging" in item 18 of section 15 thus makes a distinction between glass and paper receptacles, the word "bottling" having reference to glass and the word "packaging" to paper containers. If "bottling" properly referred to paper containers, there was no need to use the word "packaging."

We point out here also that the respondent's container is not a "standard milk bottle" even if the broad meaning of the term constructed by the trial court were followed, i. e., even if paper containers in general may be within the meaning of the words "milk bottles." For the evidence shows that the respondent's container is not a "standard" container as the trial court interpreted the term. As to the paraffin bath used at the respondent's Chemung plant

in forming paper containers, the respondent's witnesses gave the temperature as from 170° to 172° (R. 711, 807, 904). And at the respondent's plant the container is in the paraffin compartment for only 19 seconds according to one of the witnesses (R. 904), and for 28 seconds, remaining submerged for 12 or 8 seconds, according to another of the witnesses (R. 806). These practices fall short of the requirements of the United States Public Health Service, which says that all paper containers shall be treated with paraffin "for at least thirty seconds at at least 180° F." (R. 1704). The respondent's container may not be said to be "standard" under its own definition of "standard" when it is not made in the manner required by the U. S. Public Health Service.

Conclusion.

The petitioners respectfully urge this court to reverse the judgment of the Circuit Court of Appeals.

No. 706

CITY OF CHICAGO, a Municipal Corporation, BOARD OF HEALTH OF THE CITY OF CHICAGO, DR. ROBERT A. BLACK, Health Commissioner and Acting President of Board of Health of the City of Chicago,

Petitioners,

vs.

FIELDCREST DAIRIES, INC.,

Respondent.

PETITIONERS' REPLY TO BRIEF OF AMICUS CURIAE, THE STATE OF ILLINOIS.

The brief of the Illinois attorney general as *amicus curiae* has been filed at the last possible moment. Had the business of the court permitted, this case would have been argued and submitted two weeks before the brief of the attorney general was filed. The Milk Pasteurization Plant Law became effective in July of 1939. From that time on the attorney general could have questioned by *quo warranto* in the state courts the power asserted by the city. Or the attorney general might have appeared in either of the lower courts at any time during the pendency of this

case and asserted his present position. Instead, his appearance is made at the last possible moment before the case is to be submitted upon oral argument.

The attorney general's apparent belief that duty required him to appear is based upon a fundamental misconception of the 1939 Milk Pasteurization Plant Act. His brief says (p. 2) that he appears, for one reason, because the case involves "an important public question that affects the public interests of the People of the State of Illinois." The only interest of the people of the state in this litigation lies in having the court hold that Illinois municipalities have the powers granted to them by the state legislature, whatever those powers may be. It is not to the interest of the people of the state to have the court hold that Illinois municipalities have been deprived by the legislature of powers that the legislature preserved in them in the 1939 statute. The attorney general also appears, he says (p. 2), to request the court to "abstain from any action in this cause which may impinge the authority of the State by limiting the general application throughout the State of an Act of the General Assembly." A decision in favor of the petitioners will not affect the authority of the state in any way or limit the general or territorial application of the 1939 statute throughout the state or limit it in any other way. When the entire statute (including the saving clause) is considered, it preserves to municipalities the very powers which the attorney general seeks to strike down. The authority of the state legislature will be affected by this litigation only if the courts fail to follow the clear language of the statute.

The petitioners' reply brief contended that there was no controversy in this case between the State of Illinois and Illinois municipalities, since the state in the 1939 Milk

Pasteurization Plant Act had expressly preserved all the former powers of municipalities to regulate the milk industry. And the petitioners' reply brief (p. 5) characterized as "spurious" the controversy between the state and the city constantly mentioned by the respondent. Now at the last moment the attorney general of the state appears in opposition to the city, seeming to make the "controversy" come to life.

The mere appearance of the attorney general does not render the alleged controversy any less spurious. The petitioners concede that the state's power is paramount. There is no question here about the power of the state to regulate milk. The controversy is about the extent of municipal power and is between the respondent and the petitioners. The question is whether or not the state has impaired a power of the city. The state's sovereignty or authority is not involved. The simple problem of statutory construction presented will be solved by interpreting the language used and considering the object sought to be achieved by the legislature. The identity of the champion of one interpretation or another has no bearing on the correct solution of the problem.

It is appropriate therefore to consider what light has been shed upon the question before this court by the appearance of the attorney general. In the first place, it is not without significance that the attorney general does not request this court to refrain entirely from passing upon the construction of the statute. To the contrary, his request is simply that the court refrain from deciding the question of statutory construction against Fieldcrest Dairies, Inc. (brief of *amicus curiae*, pp. 2, 3). A consideration for the broad principles of statesmanship which prompt this court to refrain from the decision of

local questions might be expected to move the attorney general to request the court to refrain entirely from a decision of the question. This, however, is not the position which the attorney general asserts.

We may well concede that in the absence of a saving clause the position asserted by the attorney general and by the respondent would be sound. Such a concession, however, does not advance the determination of the case. A discussion of a non-existent statutory situation is not helpful. The attorney general's lack of understanding of the problem involved is clearly shown in his discussion of the saving clause (brief of *amicus curiae*, p. 7). All that is said of the saving clause is this:

> "It is submitted there is nothing in this section that might properly be interpreted as authorizing the city to outlaw the containers that the State has legalized for use within the state, in accordance with the express provisions of the Act."

This much is said. It is the sole contribution of the attorney general toward the solution of the controversy before the court. What is unsaid is most significant. The argument of the attorney general is inadequate in the same particulars as the respondent's argument (see reply brief of petitioners, pp. 8-9). The attorney general suggests no meaning that can be ascribed to the saving clause. No inference is possible from his argument save the inference that municipal control of all matters dealt with in the Milk Pasteurization Plant Law has been completely destroyed.

The logic of his argument would compel him to assert that any subject dealt with in the statute or in the "minimum requirements" adopted pursuant to it is "legalized" and so placed beyond the reach of municipal control. The

same logic would be applicable to the saving clause contained in the Grade A Milk Law, which the *state* Department of Public Health construes as authorizing municipalities to make more stringent regulations than the state (see reply brief of petitioners, p. 13), an interpretation which the respondent itself (brief, p. 32) concedes to be correct. The position of the respondent and the attorney general is that the legislature meant one thing in the saving clause of the Milk Pasteurization Plant Law, which primarily regulates dairy plants, and another thing in using similar language in the saving clause of the Grade A Milk Law, which primarily regulates dairy farms. In other words, the attorney general attributes to the legislature the anomolous intention of continuing the power of cities to regulate dairy farms (which of course are in non-urban areas) and withdrawing the power to regulate dairy plants.

The attorney general (pp. 4-6) repeats the argument of the respondent that the state's "approval" of the equipment and methods of operation of pasteurization plants and the requirement that milk must be placed in the final delivery container in the plant mean that the state "legalizes" and "approves" single-service milk containers. This is said to be the policy of the legislature. Any approval manifested by the statute is made subject to the express provision in the statute itself that permits more stringent municipal regulation. This obvious answer to the argument that the state has "approved" paper milk containers was made in the petitioners' original brief (p. 24). It has not been answered either by the respondent or the attorney general.

After discussing the Milk Pasteurization Plant Law without mentioning the saving clause, the attorney general (brief, pp. 5-6) asks this rhetorical question:

> "How could the Legislature any more clearly evidence an intent that milk which is pasteurized in a pasteurization plant approved by the State Department of Public Health, placed in containers in said plant, which containers are aproved by the Department of Public Health, and which must be sold in said original containers, may be sold in said containers at any place in the State of Illinois?"

Such a question might be pertinent if the saving clause had been omitted from the statute. A more pertinent inquiry is this: How could the legislature any more clearly evidence an intent that the police power in this field of public health protection is to be distributed between the state and its municipalities in such a manner that the minimum requirements of the state may be increased by municipalities?

The attorney general's brief (pp. 7-8) quotes a stipulation in the record about testimony which would be given by one S. V. Layson if called as a witness. The testimony relates to certificates of approval issued by the state Department of Public Health to Fieldcrest Dairies, Inc. on November 17, 1938 for the calendar year 1938 and on January 18, 1939 for the calendar year 1939. At the time of the issuance of these certificates the 1939 Milk Pasteurization Plant Law had not been enacted. Their issuance does not show that the 1939 statute impaired the city's power. And in any event the state's certificate of approval is merely evidence of compliance with state regulations; the saving clause says that municipalities may impose other and more strict regulations.

The brief of the *amicus curiae* (p. 9) contributes nothing in its attempt to show that the cases of *City of Geneseo* v. *Illinois Northern Utilities Co.*, 378 Ill. 506 (1941), and *City of Ottawa* v. *Brown*, 372 Ill. 68 (1939), have no ap-

plication here. The cases show clearly that in related situations the Illinois Supreme Court has interpretated legislative grants of municipal power as the petitioners contend the 1939 statute should be interpreted here.

The argument of the attorney general does not indicate a conflict between state and municipality. Unless his mere appearance urging that this court decide the question in favor of the respondent or not at all is effective to create a controversy, the status of the case is not affected by his appearance.

Petitioners,

vs.

FIELDCREST DAIRIES, INC.,

Respondent.

REPLY TO ADDITIONAL SUGGESTIONS FILED BY AMICUS CURIAE.

"Regulate" and "Prohibit".

Much of what the attorney general's brief says is answered in the briefs already filed by the petitioners. But it is important to point out the infirmity in his contention that the city's power to regulate the sale of milk does not authorize the prohibition of paper milk containers.

In discussing the relative terms "regulate" and "prohibit" the attorney general's brief overlooks the necessity of considering the subject-matter of a power to regulate. Every power to regulate necessarily includes the power to prohibit what does not meet a regulation imposed. In the

case at bar the subject-matter of the city's power to regulate is the sale of milk. The power is derived from the 1872 Cities and Villages Act giving the city power "to regulate the sale of . . . provisions" and the 1941 statute authorizing the city "to regulate the sale of all beverages" and "to . . . regulate . . . the manner in which any beverage . . . for human consumption is sold" (see brief of petitioners, pp. 13-14). The Illinois Supreme Court said in *Koy* v. *City of Chicago*, 263 Ill. 122, 131 (1914), that in the exercise of these powers a city may require "the receptacles in which milk is contained to be of prescribed character." And the saving clause in the 1939 Milk Pasteurization Plant Act provided that nothing therein impaired the power of the city "to regulate the . . . sale or distribution of pasteurized milk."

The brief of the attorney general argues as if the subject-matter of the city's power to regulate were merely paper milk containers. It may be that a grant of power merely to regulate paper milk containers would not include the power to prohibit them absolutely. But while the power to regulate the sale of milk or the manner of selling milk might not authorize the city to forbid absolutely the sale of milk, it necessarily includes power to prohibit a milk container that does not comply with the regulations prescribed under the power to regulate the sale of milk.

This obvious conclusion is not contradicted by the authorities referred to by the attorney general. There is no peculiar "federal rule" about powers to regulate, as the attorney general intimates (p. 1). His brief refers to judicial constructions of the word "regulate" noted in 36 *Words and Phrases*, 696-702. Many of the cases there cited held that statutes granting cities the power to regulate intoxicating liquor did not authorize them to pass or-

dinances absolutely prohibiting its sale. So in *People* v. *Busse,* 240 Ill. 338 (1909), where the statute granted the city power to regulate "second-hand junk stores," an ordinance imposing an absolute prohibition on second-hand junk stores in certain areas was held unauthorized. In all of these cases the entire subject-matter of the power to regulate was absolutely prohibited. In the case at bar the subject-matter of the power—the sale of milk—is not completely prohibited by the ordinance but is merely regulated.

Other Illinois cases cited by the attorney general do not support his contention. In *Haggenjos* v. *City of Chicago,* 336 Ill. 573, 576, 577 (1929), it was said, "the power to regulate implies the power to prohibit except upon the observation of authorized regulation." Applying this language here, the power to regulate the sale of milk implies the power to prohibit its sale except upon the observation of the regulation that the sale must be made in standard milk bottles. In quoting from *Chicago Motor Coach Co.* v. *City of Chicago,* 337 Ill. 200, 206 (1929) and in discussing *City of Geneseo* v. *Illinois Northern Utilities Company,* 378 Ill. 506 (1941), the attorney general overlooks the fact that in the later case the Illinois Supreme Court discounted the importance of the distinction drawn in the earlier case between powers to regulate and powers to prohibit. The Supreme Court said (p. 519) that the *Chicago Motor Coach Co.* and another case were

> ". . . the only direct authority for the contention that the Public Utilities act has taken from cities all power to permit or *prohibit* the use of a street by a public utility, as distinguished from the right to *regulate* a public utility operating in the street under a license or franchise granted by the city." (Italics added.)

And the court said (p. 530) that anything said in these two earlier cases indicating that a city's power to refuse a

license to a public utility had been repealed by the Public Utilities Act "is not adhered to."

The inconsistency of the attorney general's position is apparent from his concession (p. 5) that city regulation may be "more stringent and more detailed than those adopted by the state legislature." This concession points directly to the conclusion that the city may forbid the use of paper milk containers. The statute says only that paper containers "shall be manufactured and transported in a sanitary manner" (section 15, item 10). It does not require their use. And the certificate of approval issued by the state to the owner of a plant means only "compliance with the provisions of" the act (section 1(e), brief of petitioners, p. 80). Nowhere does the act say expressly or by implication that specific articles are "approved" in the sense of being put beyond the reach of further municipal regulation. On the contrary, the saving clause in section 19 says just the reverse.

The Attorney General's Suggestion about Disposition of the Case.

The attorney general's memorandum suggests (p. 6) that the case be decided by affirming the judgment below or by remanding the case to the district court to await the decision of a criminal prosecution to be brought in the state courts by the city against some other company using paper cartons, the injunction in the meantime to remain in effect. The unseemly partisanship of this suggestion is apparent. But there are also inherent obstacles to any disposition of the case other than full disposition on the merits:

1. The district court's holding and the Circuit Court of Appeals' statement that the ordinance is an unreasonable

regulation under the due process clause of the fourteenth amendment constitute an obstacle which, realistically considered, is almost insurmountable. The state courts will feel bound by these rulings as this court feels bound by state court rulings on local questions.

2. A police court is not an appropriate forum for the determination of a constitutional question that requires the testimony of experts.

3. If a state court action for an injunction is brought by a milk distributor, either upon a dismissal of the case at bar for want of equity jurisdiction or a remandment to the district court to await a decision of the state question in the state courts, the plaintiff will be compelled to urge that the ordinance is invalid under the fourteenth amendment. If he relies simply upon the alleged impairment of the city's power, he forfeits the opportunity to raise the constitutional question, for a rule of ancient vintage, originating in a desire to expedite the disposition of litigation, prevents him from "splitting" his cause of action.

4. The federal courts' ruling on the constitutional question will be ground for a temporary injunction in the state courts and will ensure the success of any injunction suit in the state courts, even though the state courts hold with the city on the question of the city's power.

5. The plaintiff in the state court action will be compelled (and so also will the city) to present evidence on the constitutional question. The long process of the taking of expert testimony will be repeated. The city will be compelled to defend another lengthy trial, after it has defended the trial in the case at bar on the same question with the resulting accumulation of three fat volumes of evidence.

6. The litigation over the constitutional question will continue for years to come, until finally passed upon by this court. The constitutional validity of the ordinance will remain in doubt, its enforcement prohibited by injunction. And during this period there will remain in effect the destructive holding of the district court and the similar dictum of the Circuit Court of Appeals that public health regulations are invalid when they prohibit what is permitted elsewhere.

The impractical consequences of the failure of this court to decide all issues raised would be particularly unfortunate in view of the simplicity of the local question of the city's power. The state law—the 1939 Milk Pasteurization Plant Act—clearly leaves unimpaired the power of the city to regulate the sale of milk and prescribe the type of milk containers to be used. This is apparent when the problem presented is correctly analyzed—the city's power is determined by looking to the legislative grant. The law as stated by the legislature should not be considered as the pronouncement of an inferior body. Surely this court can determine what the state law is from the clear language of the statute even in the absence of a declaration by a state court: "the law as stated by the legislature means what it says." Legislation does not require judicial endorsement to be effective.

Similarly the record in this case makes the constitutional question an easy one to decide.

We continue to urge the court to decide the case on the merits, as we have done in all the briefs filed in this court

(brief in support of petition for certiorari, pp. 36-37; brief of petitioners, pp. 31-34; reply brief of petitioners, pp. 4-6).

JOINT STATEMENT OF COUNSEL CONCERNING CASE OF DEAN MILK COMPANY, AN ILLINOIS CORPORATION vs. CITY OF CHICAGO, A MUNICIPAL CORPORATION, et al., IN CIRCUIT COURT OF COOK COUNTY, ILLINOIS AND APPELLATE COURT OF ILLINOIS, FIRST DISTRICT.

MAY IT PLEASE THE COURT:

During the oral argument of this case Mr. Chief Justice Stone requested counsel for the petitioners and the respondent to submit to the court a statement about the proceedings in the Illinois courts in the case of *Dean Milk Company, an Illinois corporation* v. *City of Chicago, a municipal corporation, et al.* In compliance with this request, the parties herewith submit their statement, together with excerpts from the record of the Circuit Court of Cook

County, Illinois, case No. 40-C-4521, and from the record of the Appellate Court of Illinois, First District, case No. 41348, in the cause entitled, *Dean Milk Company, an Illinois corporation, plaintiff* (*appellee* in the Appellate Court) v. *City of Chicago, a municipal corporation, et al., defendants* (*appellants* in the Appellate Court). Some of the papers filed and orders entered in the Circuit Court of Cook County (the trial court) are reproduced in full (except for the omission of captions) and without comment; in other instances the Circuit Court and Appellate Court proceedings are summarized by counsel.

A. CIRCUIT COURT PROCEEDINGS—MAY 15 TO MAY 21, 1940.

Text of Complaint Filed May 15, 1940.

Now comes the plaintiff, Dean Milk Company, a corporation duly organized and existing under and by virtue of the laws of the State of Illinois, by Dennis J. O'Toole, its attorney, and complaining of the defendants City of Chicago, a Municipal corporation; Edward J. Kelly, as Mayor of the City of Chicago; James P. Allman, as Commissioner of Police; Board of Health of the City of Chicago; Herman N. Bundesen, as President of the Board of Health of the City of Chicago; and Francis A. Dulak, Harry J. Reynolds and Louis E. Schmidt and Lloyd Arnold, as members of the Board of Health of the City of Chicago, alleges as follows:

1. That plaintiff is a corporation duly organized and existing under and by virtue of the laws of the State of Illinois; that the objects and purposes for which said corporation was incorporated are: to buy, sell, deal in, manufacture, process, cut, store and ship cream, milk, butter,

cheese, ice cream, ice-cream mix, sugar, condensed milk, powdered milk, evaporated milk, malted milk, distilled water, milk products and by-products, ice and all such other articles as may be necessary or may be conveniently used in connection with the aforesaid business or businesses; to own, lease and manage, directly or through subsidiaries, dairies and dairy farms, creameries and cheese factories, and conduct a general manufacturing business. That the corporate structure of plaintiff consists of 100,000 shares of common stock of no par value, of which 72,500 shares have been issued and 15,000 shares of preferred stock, the par value of which is $60 per share and of which 7,500 shares have been issued. That the reasonable value of all the machinery and equipment owned and belonging to plaintiff and which is used in the carrying on and functioning of its business is approximately $1,700,000; that the cost of three machines hereinafter more fully described which are used by plaintiff in the filling and packaging of the Grade "A" milk sold by plaintiff is in the amount of $15,000 each, and a royalty is paid to the licensor of the machines depending on the number of packages or containers used.

2. That the defendant, City of Chicago, is a Municipal corporation located in the County of Cook in the State of Illinois. The defendant, Edward J. Kelly, is the duly elected, qualified and acting mayor of the City of Chicago and is charged with the enforcement of the ordinances of said city and with the administration of the governmental affairs of said city. The defendant, James P. Allman, is the duly appointed, qualified and acting superintendent of police of the City of Chicago and as such is the head of the police department of said city, and is also charged with the enforcement of the ordinances and regulations of said city. That the defendant, Board of Health of the City of

Chicago is a board established for the city, having as its purpose the management and control of all matters and things pertaining to the health work of the city. That the defendants, Herman N. Bundesen, as President of the Board of Health of the City of Chicago, and Francis A. Dulak, Harry J. Reynolds, and Louis E. Schmidt and Lloyd Arnold, as members of the Board of Health of the City of Chicago were duly appointed to perform and enforce all the laws of the City and the provisions of the Municipal Code of the City of Chicago pertaining to the public health and sanitary condition of the City. The said Board of Health and its members have the duty of investigating or causing to be investigated the place of business of any and all applicants for a license to sell milk or milk products in the City of Chicago as well as to investigate the vehicles, methods and equipment used by such applicants.

3. (a). That the milk and milk products sold and distributed by plaintiff are secured, pasteurized and packaged in its plant and factory located in the town of Chemung in the State of Illinois, approximately seventy-six miles from Chicago. The milk used by plaintiff is received each morning from farms which have been inspected and approved by the Board of Health of the City of Chicago, pursuant to Chapter 154 of the Municipal Code of Chicago, section 17. When the milk is received it is tested by a test commonly known as the "methylene blue" test. The milk is then weighed and placed in a tank from which tank it is run through certain equipment known as "Flash" pasteurizing equipment, which "Flash" pasteurizing process consists of heating the milk to a temperature of 161½ degrees Fahrenheit and holding the milk at said temperature for at least sixteen seconds, which method is in accordance with the Statutes of the State of Illinois, to-wit,

section 1 of an act entitled "An Act regulating the handling, processing, labeling, sale, and distribution of pasteurized milk and milk products," approved July 24, 1939.

(b). After the milk is so processed it is immediately cooled and placed in a sanitary tank connected with a machine known as the "Ex-Cell-O" machine, where it is packaged or placed in containers known as single-service containers of less than one gallon in size, to-wit: quarts, pints, and half-pints.

4. That the factory or plant of plaintiff and its equipment and the pasteurization process used by plaintiff have been approved by the State of Illinois and a permit issued to plaintiff on November 17, 1938, again on January 18, 1939, and again on April 25, 1940.

5. That prior to the issuance of each of the permits to plaintiff by the State of Illinois, its plant, equipment and method of operation were inspected by the State Department of Health of the State of Illinois and found to comply with the provisions of an act entitled "An Act regulating the handling, processing, labeling, sale, and distribution of pasteurized milk and milk products"; that attached hereto as Exhibit "B" and made a part hereof is a copy of said Act which was approved on July 24, 1939.

6. (a). That plaintiff in packing or packaging its milk or milk products causes the same to be placed by the aforesaid "Ex-Cell-O" machine in containers known as single-service containers and described as "Pure-Pak"; that said "Pure-Pak" containers are made of virgin spruce pulp, manufactured by the Cherry River Paper Company of Richwood, West Virginia. In the manufacture of these containers no other material of any kind other than virgin spruce pulp is used.

(b). The pulp used in making the containers is made from logs which are cleaned of bark and washed and chipped. The chips are then cooked for twenty hours in a sulphur-lime solution at a temperature of 250 degrees Fahrenheit, thereby killing any bacteria which might exist in the pulp. The water used in the manufacturing process is first sand-filtered and sterilized with chlorine and ammonia. In making the fibre board for the container, the pulp is passed over thirty-five hot cylinders which are heated by steam at fifteen pounds pressure. The fibre board is then free of bacteria.

(c). The fibre board is then packed and sent to Gardner-Richardson at Middletown, Ohio, where it is cut into a blank form. All the information required by section 11 of chapter 154 of the Municipal Code of the City of Chicago is then printed upon the blank form, together with the name and address of the Dean Milk Company and the quantity and quality of the product to be therein contained. The forms are packed in a sanitary sealed package and then shipped to the plant of the plaintiff. Attached hereto as Exhibit "C" and made a part hereof is one of the forms of containers above mentioned.

7. (a). The "Ex-Cell-O" machine, into which the milk is diverted for the purpose of packaging as hereinabove set forth, is a machine for the automatic forming, paraffining, filling and sealing of the blanks or containers, which when formed, make the "Pure-Pak" container. A quantity of these fibre board blanks are placed on a tray of the "Ex-Cell-O" machine and then are automatically conveyed into the machine. In the machine the containers are opened, formed and glued before they are paraffin-coated and sterilized. The paraffin used as a sealing agent on the fibre board blanks is manufactured by the Socony-Vacuum

Corporation of New York, New York, and complies with the U. S. Pharmacopeia X standard. The paraffin is preheated and passed through a filter screen and the containers are immersed therein and thereafter sterilized for thirty seconds at 172 degrees Fahrenheit. Thereafter the containers are cooled at 39 degrees Fahrenheit before they are filled with milk. All of which process takes place automatically and without being touched by human hands.

(b). That said container after being so immersed in paraffin has adhered to the interior and exterior surfaces thereof a sufficient quantity of paraffin so as to make it impervious to the absorption of its milk content as well as to prevent infiltration of moisture from the outside. The adhesive used at the bottom of the paper container before the same is immersed in the paraffin bath is not in any respect harmful and is prepared, packaged and shipped in a sanitary manner.

(c). Within sixty seconds after the containers have been sterilized they are filled with milk, which is measured automatically by the "Ex-Cell-O" machine and the top of the container is stapled with a sterilized tinned wire staple. The top of this container is stapled together with tremendous pressure, one side of the container being folded over the other in a tight seal, which from the heat of the tinned wire melts this paraffin sufficiently to reseal tightly the said fold. After being filled and stapled the containers are placed by the operator of the "Ex-Cell-O" machine in corrugated boxes, which are closed and sealed with a paper adhesive strip. Attached hereto and made a part hereof, as Exhibit "D", is a pamphlet issued by the "Ex-Cell-O" Corporation, describing the "Pure-Pak" containers and method by which they are filled with milk.

(d). After the single-service containers are filled with milk or milk products they are inserted in a cooler having

a temperature of 34 degrees Fahrenheit, which temperature is maintained at all times thereafter until the milk is ready for shipping in plaintiff's refrigerated trucks or other means of refrigerated conveyors.

8. The machinery and equipment used in the packaging and selling of milk and milk products in the "Pure-Pak" single-service containers of the plaintiff are so constructed as to prevent any part of any person or his clothing from coming in contact with any surface with which the milk or milk products come in contact in the process of packaging. All parts of said machinery and equipment can be readily cleaned and are so constructed as to prevent any foreign substance from reaching the inside parts thereof. All surfaces of the machinery and equipment with which the milk comes in contact are smooth, being of stainless steel, the same type as used by Chicago dairies. Said equipment is easily accessible for cleaning. All employees performing such work wear clean outer garments and maintain a high standard of cleanliness at all times while so engaged in said work. All the vehicles and means of conveyance used by plaintiff in transporting said milk or milk products are completely enclosed and so constructed for the purpose of protecting the milk and milk products from heat, freezing or contamination, and bear the name of plaintiff displayed in a prominent place thereon.

9. That said above described single-service containers are sterile and are light and safe in handling. That said containers after being once used cannot be used again. The manufacturing of single-service containers complies in every respect with the rules and regulations of the Board of Health of the City of Chicago and the Ordinances of the City of Chicago with regard to milk and milk products, a copy of which ordinances is hereto attached, marked

Exhibit "E" and made a part hereof. That plaintiff's place of business, its vehicles, equipment, machinery and processes used in packaging and the sale of milk and milk products are in every respect sanitary and fit for the uses and purposes of selling milk and milk products in the City of Chicago, and comply with the ordinances of the City of Chicago and the rules and regulations of the Board of Health.

10. That plaintiff's milk plant at Chemung, Illinois, where the above described pasteurization and packaging of milk in single-service containers takes places, has been inspected and approved by the Board of Health of the City of Chicago for the sale of Grade "A" milk and cream at wholesale and said approval exists at this time and has existed since June 22, 1936.

11. (a). That plaintiff has on May 2, 1940, and prior thereto, made application to the City of Chicago and Board of Health of the City of Chicago for a license or permit to sell its Grade "A" pasteurized milk and milk products packaged in the aforementioned containers, which are commonly known as single-service containers, within the corporate confines of the City of Chicago, but said City of Chicago and the Board of Health of the City of Chicago have refused to issue a permit or license to plaintiff to do same. That said refusal has been based upon Section 15 of Chapter 154 of the Municipal Code of Chicago, which is as follows:

> "Any milk or milk products sold in quantities of less than one gallon shall be delivered in standard milk bottles. Provided, however, that nothing herein contained shall be construed to prohibit hotels, soda fountains, restaurants, and similar establishments from dispensing milk or milk products from sanitary dispensers approved by the board of health."

said defendants claiming that the single-service containers in which the milk or milk products of this plaintiff are packaged are not "standard milk bottles" as provided by said Code of the City of Chicago.

(b). That on, to-wit, the 2nd day of May, 1940, the following communication was addressed to the Chicago Board of Health by plaintiff:

"May 2, 1940.

Chicago Board of Health,
54 Hubbard Street,
Chicago, Illinois.

Attention Dr. Herman N. Bundesen, Pres.

Gentlemen:

As duly elected president of the Dean Milk Company, an Illinois corporation, I hereby make formal request and application for the immediate issue of a permit in the name of the Dean Milk Company to sell and distribute Grade A pasteurized milk and milk products within the City of Chicago, pasteurized and packed in single-service containers at Chemung, Illinois; said Chemung plant, as the Board knows, was thoroughly checked by representatives of the Board, and said plant now holds and has held since 1938 certificates of approval for a pasteurization plant issued by the State Department of Public Health.

I make this immediate request for a permit for the Dean Milk Company because:

1. The United States Public Health Code and ordinance has approved single-service containers.

2. The Chicago Board of Health, by formal resolution in a lawful and proper meeting on October 16, 1939, approved and recommended the use of single-service containers, as follows:

'The Board of Health recommended to the City Council that Section 154-15 of the Municipal Code of Chicago be amended by adding the words "or in single service containers" after the words "standard milk bottles" in the third sentence of such section, and

'That the Board adopt such standards as have been promulgated and recommended by the U. S.

Public Health Service for the manufacture and handling of single service containers and which are herewith attached.'

3. Lastly, because proved and satisfactory experience in 488 cities and villages throughout the United States, from a public health standpoint, have shown single-service containers to be completely satisfactory, safe and advisable.

Respectfully requested,

DEAN MILK COMPANY,
President.

SED:DL.

P. S. Right close to home in the suburbs, we find Evanston receiving the highest U. S. Public Health Rating in the annual U. S. Public Health ratings, and the members of the Chicago Board of Health know Evanston has used our single-service containers for many, many months."

12. (a). That the use of single-service containers has become standard in many places in the United States. The manufacturing and processing of the single-service containers has passed all the required tests of the respective health authorities of the following states and are now therein used:

District of Columbia,	New Hampshire,
California,	New Jersey,
Delaware,	New York,
Illinois,	North Carolina,
Kentucky,	Ohio,
Maine,	Oregon,
Massachusetts,	Pennsylvania, and
Michigan,	West Virginia.

(b). That the packaging and sale of plaintiff's milk and milk products in said single-service containers has been approved by the health authorities of municipalities about the City of Chicago. The following is a list of such municipalities in which for a considerable length of time plain-

tiff's milk and milk products in single-service containers have been sold without any harmful or detrimental effects to the persons purchasing and using the same:

Arlington Heights,
Bellwood,
Bensenville,
Berkeley,
Berwyn,
Broadview,
Brookfield,
Blue Island,
Calumet Park,
Congress Park,
Chicago Ridge,
Deerfield,
Des Plaines,
Dixmoor,
Dolton,
East Chicago Heights,
East Hazelcrest,
Elmhurst,
Elmwood Park,
Evanston,
Fairview,
Flossmoor,
Forest Park,
Franklin Park,
Glencoe,
Glenview,
Glen Ellyn,
Greenwood,
Hazelcrest,
Hinsdale,
Homewood,
Highland Park,
Highwood,
Kenilworth,
LaGrange,
Lake Forest,
Lansing,
Lombard,
Lyons,
Maywood,
Melrose Park,
Midlothian,
Morton Grove,
Mount Prospect,
Niles Center,
Northbrook,
North Riverside,
Oak Lawn,
Oak Park,
Orland Park,
Palos Park,
Park Ridge,
Phoenix,
Posen,
Riverdale,
River Forest,
River Grove,
Riverside,
Robbins,
Schiller Park,
Stickney,
South Holland,
Villa Park,
Western Springs,
Wheaton,
Wilmette,
Winnetka, and
Worth.

(c). That the following is a partial list of the 490 cities in the United States in which milk and milk products are sold in single-service containers:

New York, New York,	Baltimore, Maryland,
Washington, D. C.,	Trenton, New Jersey,
Cleveland, Ohio,	San Francisco, California,
Detroit, Michigan,	Jersey City, New Jersey,
Toledo, Ohio,	Boston, Massachusetts,
Philadelphia, Pennsylvania,	Wilmington, Delaware,
Los Angeles, California,	Superior, Wisconsin.

13. That plaintiff in making its application for license or permit to sell its milk or milk products in single-service containers in the City of Chicago has sent its check for $60.00 to the Board of Health to cover the costs of issuing a license or permit to plaintiff to sell its above described products in the City of Chicago.

14. (a) The U. S. Public Health Service (Public Health Bulletin No. 220, 1939 Edition) in the recommendation of a milk ordinance and code to be adopted by the states and municipalities of the United States has recommended the use of single-service containers such as are used by the plaintiff herein. Item 12r of Section 7 of said recommendations states as follows:

> "All multi-use containers or other utensils used in the handling, storage, or transportation of milk or milk products must be made of smooth nonabsorbent material and of such construction as to be easily cleaned, and must be in good repair. Joints and seams shall be soldered flush. Woven wire cloth shall not be used for straining milk. All milk pails shall be of small-mouth design approved by the health officer. The manufacture, packing, transportation, and handling of single-service containers and container caps and covers shall be conducted in a sanitary manner."

and item 10p of said Section 7 states as follows:

"All multi-use containers and equipment with which milk or milk products come in contact shall be constructed in such manner as to be easily cleaned and shall be kept in good repair. The manufacture, packing, transportation, and handling of single-service containers and container caps and covers shall be conducted in a sanitary manner.

* * * * * * *

(5) The manufacture, packing, transportation, and handling of single-service containers and container caps and covers are conducted in accordance with the following requirements. Inspections required herein may be made by the health officer or by any agency authorized by him.

(a) The buildings and rooms in which single-service containers and container caps and covers are manufactured, packed, stored, and handled shall be clean, well lighted, and ventilated, and free of dust and flies, as prescribed in items 1p, 2p, 3p, 4p, 6p, 7p, 8p, and 11p.

(b) The average bacterial plate count of the stock from which single-service containers and container caps and covers are made shall not exceed 250 colonies per gram. No substance shall be present in finished single-service containers and container caps and covers which is toxic.

(c) All operations at the fabrication plan and during transportation of the manufactured articles shall be conducted as to reduce to a minimum the possibility of contaminating the manufactured articles, as prescribed in items 13p, 14p, and 15p.

(d) All of those parts of machinery and equipment with which the article being manufactured comes in contact shall be kept clean.

(e) All single-service containers and container caps and covers shall be so treated as to be as impervious to milk and milk products as practicable.

The porous condition of paraffined containers now available and the sloughing off of particles of paraffin into the product are undesirable, and manufacturers of single-service containers are urged to make every effort to provide a nonabsorbent non-flaking surface.

(f) All single-service containers and container caps and covers shall prior to use be given bactericidal treatment equivalent to contact with paraffin for at least 20 seconds at at least 180° F., or for at least 35 seconds at at least 175° F., or for at least 1 second at at least 225° F., in approved equipment operated in an approved manner. The bactericidal treatment equipment shall be provided with approved indicating and recording thermometers, and shall be so designed as automatically to insure the required temperature and contact time."

(b) That the rooms and buildings in which the single-service containers used by plaintiff are stored, packed and handled, are clean, well lighted and ventilated, and are free of dust and flies. That the average bacterial plate count of the stock from which the single-service containers used by plaintiff are made is considerably less than 250 colonies per gram, and no toxic substance is present in the finished single service container used by plaintiff. There is no possibility of contamination of the milk or milk products of plaintiff in their production, packaging or transportation. The surface of the single service containers used by plaintiff, after being paraffined is nonabsorbent and nonflaking. No particles of paraffin on the container slough off. The containers used by plaintiff are, prior to their use, given bactericidal treatment equivalent to contact with paraffin for 35 seconds at 175 degrees Fahrenheit, the equipment therefor being provided with thermometers which automatically insure such temperature and contact time.

15. (a) At a meeting of the Board of Health on November 12, 1935, the following resolution was adopted as part of the rules and regulations of the Board of Health:

"Whereas, the present increase in the number of cases of Scarlet Fever in the City of Chicago is increasing the possibility of milk borne infections, and Whereas, it now becomes urgent and necessary for

milk and milk products used in the City of Chicago to be dispensed only in unopened original containers, as received from the distributor;

Therefore, Be It Resolved:

That all milk and milk products shall be sold, served or dispensed to the final consumer only in unopened original containers as received from the distributor; and no fractional portion or part of any original package or container shall be served or dispensed for consumption except for manufacturing purposes."

(b) At a meeting of the City Council of the City of Chicago the following resolution was introduced by Herman N. Bundesen, in which the City Council of the City of Chicago was asked to modify the milk ordinance so that single-service containers may be used in Chicago:

"Since my only concern as President of the Chicago Board of Health with regard to paper containers has been to have as positive assurance as possible that fresh fluid milk can safely be delivered in such containers, and

Because the U. S. Public Health Service, whose standard milk ordinance has been adopted by the City of Chicago has not heretofore included definite standards for the manufacture of single service containers, and

Because it was believed that we would not be acting in the best interests of safety in permitting the use of these containers until the U. S. Public Health Service had adopted suitable regulations for their manufacture and use, and

Because we have in the past followed closely the requirements of the Service, it was deemed advisable to prohibit the use of these containers in the absence of such regulations, and

Since it has now been brought to our attention that such standards have now been adopted by the Service, it is moved that

The Board of Health recommend to the City Council that Section 154-15 of the Municipal Code of Chicago be amended by adding the words "or in single service

containers" after the words "standard milk bottles" in the third sentence of such section, and

That the Board adopt such standards as have been promulgated and recommended by the U. S. Public Health Service for the manufacture and handling of single service containers and which are herewith attached."

(Said recommendation being hereto attached as "Exhibit F" and made a part hereof.)

(c) That the single service containers used by the plaintiff have been accepted and approved as sanitary, and fulfill the requirements of the rules and regulations of the Board of Health of the City of Chicago.

16. That the plant of plaintiff has been inspected by the officials of the State of Illinois and the method of pasteurizing, packaging and selling the Grade A milk and milk products of plaintiff in single-service containers has been approved by the State of Illinois; that the plant of plaintiff has been inspected and approved by the Board of Health of the City of Chicago for the sale of Grade "A" milk and cream at wholesale; that the packaging and sale of milk in single-service containers has been recommended by the Chicago Board of Health and the defendant Herman N. Bundesen, as president of the Board of Health of the City of Chicago.

Yet despite all of the foregoing, the City of Chicago has failed and persists in not issuing a license or permit to plaintiff to sell within the City of Chicago its Grade "A" pasturized milk and milk products, which are packed in single service containers.

17. The plaintiff is now ready, willing and able to sell its Grade "A" milk and milk products in said container to retail stores for consumers and to the consumers themselves in the City of Chicago; that certain milk distribu-

tors are desirous of entering into contracts with plaintiff to buy said products contained in single service containers from plaintiff; that the refusal by the defendants of permission to plaintiff to sell such products in single-service containers is arbitrary, unreasonable, unlawful and capricious and as a result thereof plaintiff has suffered and will continue to suffer a loss of many thousands of dollars.

18. (a) That the City of Chicago in failing to permit plaintiff to sell its Grade "A" pasteurized milk and milk products contained in single service containers in the City of Chicago is giving preferential treatment to those milk companies and milk producers who are selling their milk and milk products within the City of Chicago in glass containers and said preference tends to create a monopoly in the sale of milk in the City of Chicago, which thereby makes said section of the ordinance unlawful and void.

(b) That the milk and milk products contained in glass containers and which are sold in the City of Chicago are capped or have on the top thereof a piece of cardboard which is porous and in many instances not coated with paraffin, and which for all practical purposes creates a situation of danger and grave concern; that although such situation exists the sale of milk or milk products in glass containers which are thus capped is not prohibited or prevented by the City of Chicago or the Board of Health.

(c) That numerous food products for human consumption are sold in paper or cardboard containers, to-wit, ice cream, cheese, butter, oysters, pickles and many other products; that the sale of said food products in such containers is not prohibited by the City of Chicago and the Board of Health.

19. That glass milk containers before they are filled with milk must be sterilized and subjected to a chlorine rinse;

that the process of so sterilizing gives rise to many evils which are conducive to the contamination of milk being thus enclosed in glass containers. That said glass containers are used over and over again while the single-service containers sold by plaintiff are used only once by the consumer and then destroyed and disposed of.

20. That the defendants have threatened to prosecute and arrest the plaintiff if plaintiff sells or attempts to sell its Grade "A" pasturized milk and milk products so contained in the single-service containers within the City of Chicago; that plaintiff is informed and believes that the defendants will carry out their threat and such threat has caused the plaintiff to refrain from selling its Grade "A" pasteurized milk and milk products in single-service containers, within the City of Chicago thereby resulting in the loss of many thousands of dollars to plaintiff by such inability to sell its products. That plaintiff is informed and believes it will be prosecuted in numerous courts and will be otherwise harassed, annoyed and injured by defendants if plaintiff attempts to sell its Grade "A" pasteurized milk and milk products in single-service containers within the City of Chicago, although the defendants have failed and still fail to issue a permit to plaintiff to sell such products and such refusal is unreasonable, arbitrary and without justification therefore.

21. (a) That the contents of the said single-service containers are incapable of contamination from rehandling after the filling thereof without the seal on the container being tampered with or the contents removed. In the event a single-service container is exposed to freezing weather, the contents of said container are not forced out by expansion as in the case of frozen milk in a glass container, for at the top of said single service container there is room

for expansion which has been scientifically prepared. The single service containers are less likely to break than the glass containers in use in the City of Chicago, and which bears the approval of the defendants.

22. That the use of said single service containers is more economical and the distribution and sale of Grade "A" pasteurized milk and milk products to consumers in the City of Chicago can be made at a lower cost and price to said consumers than the milk and milk products furnished and contained in glass containers; that said single service containers used by plaintiff at all times contain the true and correct measure and quality of Grade "A" pasteurized milk and milk products.

23. That the conduct of the defendants in refusing to issue a permit or license to plaintiff to sell its Grade "A" pasteurized milk and milk products in single-service containers within the City of Chicago is unreasonable, illegal, and prejudicial and such conduct is without justification therefor; that such conduct deprives plaintiff of the equal protection of the laws in violation of the Fourteenth Amendment of the Constitution of the United States, and section 2 of Article 2 of the Constitution of the State of Illinois, and section 13 of Article 2 of the Constitution of the State of Illinois, in that said acts on the part of the defendants deprive plaintiff of its property without due process of law.

24. That the provisions of the Municipal Code of the City of Chicago as hereinbefore set forth and referred to, do not prohibit the use of the single-service container so used by plaintiff and known as "Pure-Pak" containers and no rule or regulation of the Board of Health of the City of Chicago prohibits the use of said single-service container within the City of Chicago; that the denial to

the plaintiff by the defendant of a permit or license to sell its Grade "A" pasturized milk and milk products in single-service containers within the City of Chicago is unreasonable, arbitrary, discriminatory and unlawful.

25. That said section 15 of Chapter 154 of the Municipal Code of Chicago which provides that all Grade "A" pasteurized milk or milk products sold in quantities of less than one gallon shall be delivered in standard milk bottles is unconstitutional and invalid in that it fails to explain or to define in any form or manner what constitutes a "standard milk bottle," its shape, size, or the material of which same must be made, and said provision is unconstitutional and invalid as it deprives plaintiff of due process of law and equal protection of the laws contrary to the Fourteenth Amendment of the Constitution of the United States, and section 2 of Article 2 of the Constitution of the State of Illinois, and Section 13 of Article 2 of the Constitution of the State of Illinois; and the prohibition by the defendants against plaintiff's use of the single-service container by virtue of said section of the Municipal Code of Chicago amounts to taking and damaging of property of plaintiff without just compensation in violation of section 13 of Article 2 of the Constitution of the State of Illinois.

Wherefore, plaintiff prays that summons issue out of and under the seal of this court against the above named defendants, and plaintiff prays for the following relief:

(1) That a temporary writ of injunction issue against defendants and each of them, restraining and enjoining said defendants and each of them from:

(a) In any manner or by any means from interfering with, obstructing, or hindering the plaintiff from the sale and distribution of its Grade "A" Pasteurized milk or milk

products in single service containers or containers known as "Pure-Pak" containers within the City of Chicago.

(b) From prosecuting the plaintiff in any action at law or in equity or in any criminal action purporting or alleged to arise out of the so-called violation by plaintiff of the ordinance or the municipal Code of the City of Chicago regarding the sale of Grade "A" pasteurized milk in single-service containers or "Pure-Pak" containers in the City of Chicago.

(c) From arresting, molesting, annoying, injuring, harming, or abusing plaintiff or its officers, agents, and servants in the sale and distribution of plaintiff's Grade "A" pasteurized milk and milk products in single-service containers or "Pure-Pak" containers within the City of Chicago.

(d) From confiscating, damaging, injuring or destroying any or all of plaintiff's Grade "A" pasteurized milk or milk products contained in single-service containers or "Pure-Pak" containers which at any time or times may be within the corporate confines of the City of Chicago.

(e) From continuing to refuse and failing to issue to the plaintiff a permit or license to sell, offer for sale, expose for sale, dispose of, exchange, or deliver, the Grade "A" pasteurized milk or milk products of plaintiff packaged and contained in containers known as single-service containers or "Pure-Pak" containers.

(2) That upon a final hearing, the defendants and each of them may be permanently restrained and enjoined from committing, performing or doing or from failing to do or performing any of the above mentioned acts, doings, or performances herein complained of.

(3) And for such other further relief as equity may require.

Dean Milk Company,
An Illinois Corporation.
By (Signed) Sam E. Dean,
Its Duly Authorized Agent.

STATE OF ILLINOIS, }
COUNTY OF COOK. } ss.

Sam E. Dean, being first duly sworn, on oath deposes and states that he is the President of Dean Milk Company, an Illinois corporation, and is its duly authorized agent on this behalf; that he has read the above and foregoing complaint by him subscribed; that he knows the contents thereof and that the matters and the things therein alleged are true in substance and in fact, except as to those matters and things he verily believes to be true.

Affiant further states that he believes irreparable damage and harm will ensue to plaintiff unless a temporary injunction is issued as prayed for in said complaint and unless the defendants are enjoined and restrained from doing or performing the actions complained of in said complaint.

(Signed) Sam E. Dean.

Subscribed and sworn to before me this 15th day of May, A. D. 1940.

(Signed) Gladys L. Burton,
(Seal) *Notary Public.*

Plaintiff's Exhibit "B" attached to complaint is a printed copy of Milk Pasteurization Plant Law of the State of Illinois and Minimum Requirements For Construction, Equipment, maintenance and Operation of Milk Pasteur-

ization Plants. Revised August, 1939. 65 pp. issued by Illinois Department of Public Health.

Plaintiff's Exhibit "C" attached to complaint is a sample of plaintiff's milk container blank similar to those in evidence in *City of Chicago* v. *Fieldcrest Dairies, Inc.* Oct. term, 1941, No. 706.

Plaintiff's Exhibit "D" attached to complaint is an advertising folder describing the "Pure-Pak" containers.

Plaintiff's Exhibit "E" attached to complaint is a copy of Chapter 154 of the Municipal Code of Chicago, containing *inter alia* the following sections:

> 154-2. No person shall sell, offer for sale, expose for sale, dispose of, exchange, or deliver, or with the intent so to do have in his possession, care, custody, or control, milk or milk products for human food, without having obtained a license for that purpose from the city.
>
> 154-8. It shall be unlawful for any person to bring into or receive into the city, for sale, or to sell or to offer for sale therein, or to have in storage where milk or milk products are sold or served, any milk or milk products unless such person possesses a permit from the board of health, and on his vehicle there appears in a conspicuous place the name and address of the milk distributor and the permit number and such other identification in such manner as as required by the board of health.
>
> Such permit may be revoked by the board of health upon violation by the permitee of any of the provisions of this chapter or of any of the rules and regulations of the board of health, or in any emergency when, in the judgment of the board of health, the milk or milk product handled by the permitee has or may become a public health menace, or in any case in which the permitee refuses the board of health the right of entrance to any dairy farm, milk plant, or vehicle, or any other place where milk or milk products are kept or stored, for the purposes of inspection or the collection and examination of sam-

ples; provided that the permitee shall, after abiding by such revocation, upon request have the right of a hearing before the board of health.

154-15. All pasteurized milk and milk products shall be placed in their final delivery containers in the plant in which they are pasteurized, and all certified milk or milk products sold for consumption in the raw state shall be placed in their final delivery containers at the farm at which they are produced.

Any milk or milk products sold in quantities of less than one gallon shall be delivered in standard milk bottles. Provided, however, that nothing herein contained shall be construed to prohibit hotel, soda fountains, restaurants, and similar establishments from dispensing milk or milk products from sanitary dispensers approved by the board of health.

The delivery of milk and milk products to, and the collection of milk and milk products containers from, quarantined residences shall be subject to the rules and regulations of the board of health.

[Note: Sec. 154-15 is a portion of Sec. 3094 in *City of Chicago* v. *Fieldcrest Dairies, Inc.*, Oct. Term, 1941, No. 706, Rec. 108-109.]

Plaintiff's Exhibit "F" attached to the complaint is Section 10 as it will appear in the 1939 printed U. S. Public Health Service Milk Code, October 7, 1939, printed in *Fieldcrest* record, Vol. III, pp. 1699-1704.

. . . . . .

Text of Answer Filed May 21, 1940.

The defendants, City of Chicago, a municipal corporation; Edward J. Kelly, Mayor of the City of Chicago; James P. Allman, Commissioner of Police of the City of Chicago; Herman N. Bundesen, President of the Board of Health of the City of Chicago; and Francis A. Dulak, Harry J. Reynolds, Louis E. Schmidt and Lloyd Arnold, members of the Board of Health of the City of Chicago, by Barnet Hodes, Corporation Counsel, and Walter V.

Schaefer, Assistant Corporation Counsel, their attorneys, answering the complaint in this case say:

1. The City of Chicago has a population of more than three and one-half million inhabitants. In the City of Chicago large quantities of milk, cream, butter milk, chocolate drink and other milk products are consumed daily. During the year 1937 an approximate daily average of 277,000 gallons of milk were sold for consumption in the City of Chicago. During the same period an approximate daily average of 27,500 gallons of cream and 20,750 gallons of milk products, such as buttermilk and chocolate milk, were sold for consumption in the city.

2. Milk, when properly produced, processed and handled, is the most nearly perfect human food. There is no article of human food more generally used than milk. Pure milk is an indispensable item in the diet of infants and children, and it is likewise an important constituent part of the diet of most invalids, and the aged and infirm. Far more milk is consumed by infants and children than is consumed by all of the other age groups in the population combined.

3. Although milk is an excelent human food, it is also an excellent medium for the growth and transmission of bacteria. The precise factors which make milk an ideal food for human beings of all ages also make milk a perfect food for bacteria.

4. Statistics collected by the United States Public Health Service show that during the decade ending with the year 1934, there was in the United States an annual average of 43 reported epidemics causing wide-spread illness and numerous deaths which have been traced directly to improper milk supplies. Most of these outbreaks have been typhoid fever epidemics, but unwholesome milk has also caused epidemics of septic sore throat, diphtheria, scarlet

fever, dysentery and poliomyelitis. Impure milk supplies have also resulted in the spread of bone and glandular tuberculosis and infantile diarrhea, as well as in the spreading of diseases of an epidemic nature.

5. Because of the grave menace to the health of the public generally which is inherent in an impure milk supply, and also because of the extreme susceptibility of infants and children, who are the principal consumers of milk, to the presence of disease organisms, impurities, adulterants and foreign substances of all types in milk, the maintenance of a pure and wholesome milk supply is one of the principal concerns of municipal government, and has long been so recognized.

6. The health of the public cannot adequately be protected aganist the hazards of an impure milk supply unless every step in the production, processing and distribution of milk is carefully safeguarded in such a manner that disease organisms present in milk are eliminated, and the possibility of the introduction of disease organisms, impurities, adulterants, or any foreign substances into milk is prevented during its production, processing and distribution.

7. Tuberculin tests for cattle are required in the State of Illinois and almost uniformly throughout the country. The plant and equipment of the farmer who produces milk for consumption in fluid form, as well as the plant and equipment of each person subsequently handling such milk during the course of its processing and distribution, are regulated with a view to preventing the possibility of the contamination or adulteration of milk.

8. The General Assembly of the State of Illinois has conferred authority upon the City of Chicago:

> "To regulate the sale of meats, poultry, fish, butter, cheese, lard, vegetables, and all other provisions,

and to provide for place and manner of selling the same and to control the location thereof."

"To provide for and regulate the inspection of meats, poultry, fish, butter, cheese, lard, vegetables, cotton, tobacco, flour, meal and other provisions."

"To do all acts, make all regulations, which may be necessary or expedient for the promotion of health or the suppression of disease." (Ill. Rev. Stat. 1937, Ch. 24, Par. 65.49, 65.52 and 65.77.)

9. In the exercise of the powers conferred upon it by the General Assembly for the protection of health of the inhabitants of the city, the City of Chicago has adopted an ordinance regulating the production, processing and distribution of milk. Said ordinance provides for the regulation of every phase of the production, processing and distribution of milk from the cow to the consumer because improper handling of milk in the distribution thereof can and will completely nullify the effect of sanitary production and processing. Included in said ordinance of the City of Chicago is the provision attacked by the plaintiff in this case which is as follows:

"Any milk or milk products sold in quantities of less than one gallon shall be delivered in standard milk bottles . . ." (Municipal Code of Chicago, section 154-15.)

10. Said ordinance of the City of Chicago first enacted in January of 1935. Prior to January of 1935 and up to the present date, the bottles in which milk in quantities of less than one gallon has been delivered in the City of Chicago have been and are made of glass. And no distribution of milk in quantities of less than one gallon in any container other glass milk bottles was permitted. The milk bottles in which milk has been delivered in the City of Chicago have definite characteristics of material and shape. They are made of glass; they are narrower at the

top than at the bottom; and they bulge with a gradual curve to their full width at about middle of the bottle. Glass milk bottles have constituted and now constitute a distinct and definite class of bottles. Paper containers have never been used for the distribution of milk in the City of Chicago. There have been no changes in the shape of milk bottles or in the material of which they are made since the first glass milk bottle was manufactured in 1884.

11. The use of paper containers for the distribution of milk is a comparatively recent developement. Only within the past five years has the paper manufacturing industry become aware of the existence of public health problems in connection with the use of paper containers for articles of food and drink. The attention of the paper industry has been devoted primarily to securing favorable consumer reaction to its products, and has been devoted in only a secondary sense, and in very recent years, to the public health problems inherent to the use of paper containers.

12. Fielderest Dairies, Inc., a Michigan corporation, authorized to do business in the State of Illinois, is a wholly owned subsidiary of the plaintiff. On February 2, 1939, Fielderest Dairies, Inc., instituted a suit in the District Court of the United States for the Northern District of Illinois, Eastern Division, against the City of Chicago and its Board of Health, which suit is pending in said Court as *Fielderest Dairies, Inc., a corporation,* plaintiff v. *City of Chicago, a municipal corporation, et al.,* defendants, No. 316. That case involves the identical paper milk container and the construction and validity of the identical provision of the ordinance of the City of Chicago which are involved in the case at bar. In that case a full trial upon the merits has been had before a Master in Chancery

duly appointed by the United States District Court. Upon that trial the testimony of very many expert witnesses was introduced with respect to the meaning and validity of the provision of the ordinance involved in this case and with respect to the sanitary and unsanitary characteristics of the Pure-Pak paper milk containers also involved in this case. 2214 pages of testimony were taken in said case and more than 90 exhibits were offered and received in behalf of the plaintiff and more than 30 exhibits were offered and received in behalf of the defendants. After proofs were closed in said case a printed brief of 191 pages was filed in behalf of the plaintiff. Thereafter an answering printed brief of 58 pages was filed in behalf of the defendants. Subsequently a printed reply brief of 58 pages was filed in behalf of the plaintiff. Thereafter, on April 27, 1940, the report of Honorable Jacob I. Grossman, Master in Chancery of the United States District Court for the Northern District of Illinois, was duly filed in said court. The report of said Master in Chancery decided the issues in favor of the defendants and found that there was evidence in the record "from the plaintiff's own witnesses" from which the City Council of the City of Chicago could reasonably have concluded that prohibition of paper containers was necessary and appropriate to protect the purity and wholesomeness of milk. The Master further found:

> "There are steps in the manufacture, conversion and filling of paper containers in which bacteria may get into the walls of the containers.
>
> Paper containers, even when paraffined, are to some extent absorbent and the milk may absorb such bacteria.
>
> Sanitary conditions differ from one paper mill to another and even in the same mill from time to time.
>
> The sanitary conditions of the mill is a significant factor as to the condition of the finished container.
>
> The sanitary condition of the paper board blank

determines the sanitary condition of the finished container.

Particles of paraffin get into the milk and constitute a foreign substance which perferably should not be in milk, especially for babies.

Odors from paraffin, whether the paraffin is fresh or not, may get into the milk.

If the paper board contains a high amount of bacteria, they may exude objectionable odors which may get into the milk.

The control and precautions by paper manufacturers themselves may not be adequate.

In the case of glass milk bottles, the City has the cleaning process at hand locally and can exercise complete control; in the case of paper containers, inspection at remote places may be necessary but impractical or too expensive.

Some paper containers have ben shown to contain high bacterial counts.

Paper containers are not transparent as glass bottles, so that it is difficult to observe the quality of the milk or whether the milk contains dirt or other foreign body.

Cream does not rise to the top in paper containers, so that purchasers may not readily know whether they are getting milk of the required fat content.

The United States Public Health Service Sanitation Board in June 1939 criticized paper containers on account of their absorbency and the sloughing off of paraffin."

Thereafter on May 7, 1940, the objections of the plaintiff to the report of the Master in Chancery were duly filed with the Clerk of said court. Thereafter on May 14, 1940, a motion was duly made in behalf of the defendants for the entry of a decree in accordance with said report. Upon the ground that there was no urgency in the disposition of the matter before the District Court, the plaintiff refused to agree to the defendant's request for a prompt hearing upon the objections to the report of the Master and the motion of the defendant for the entry of a decree.

13. Defendants allege that the Pure-Pak paper container advocated by the plaintiff in this case is neither non-absorbent nor sterile. On the contrary, defendants alleged that said container is absorbent and is not sterile; that there are steps in the manufacture, conversion and filling of paper containers in which bacteria may get into the walls of the containers; that paper containers are absorbent, so that milk placed in such containers may absorb bacteria from the paper walls of the containers; that the sanitary conditions existing in the mill which manufactues the paper, and in all other plants subsequently handling and processing such paper, determine the sanitary condition of the finished milk container; that particles of paraffin from paper containers slough off into the milk placed in those containers; that odors from paraffin get into the milk placed in paper containers; that bacteria present in the paper from which the paper containers are made exude objectionable odors which may get into the milk; that paper containers are not transparent so that it is impossible to observe the quality of the milk and to observe whether or not the milk contains dirt or other foreign object; that milk placed in paper containers undergoes a physical, chemical or electrical process which so affects the physical or chemical characteristics of the milk that the cream therein will not rise to the top of the container as it ordinarily does in containers made of material other than paper; that the paper container sold by the plaintiff contains toxic substances.

14. The defendants have no knowledge or information sufficient to form a belief with respect to the truth of the allegations contained in the following paragraphs of the complaint:

(a) The allegations of paragraph 1 of the complaint.

(b) The allegations of paragraph 3(a) of the complaint.

(c) The allegations of paragraph 3(b) of the complaint.
(d) The allegations of paragraph 4 of the complaint.
(e) The allegations of paragraph 5 of the complaint.
(f) The allegations of paragraph 6(a) of the complaint.
(g) The allegations of paragraph 6(c) of the complaint.
(h) The allegations of paragraph 7(c) of the complaint.
(i) The allegations of paragraph 7(d) of the complaint.
(j) The allegations of paragraph 8 of the complaint.
(k) The allegations of paragraph 12(a) of the complaint.
(l) The allegations of paragraph 12(b) of the complaint.
(m) The allegations of paragraph 12(c) of the complaint.
(n) The allegations of paragraph 17 of the complaint.
(o) The allegations of paragraph 21(a) of the complaint.
(p) The allegations of paragraph 21(b) of the complaint.
(q) The allegations of paragraph 22 of the complaint.

15. The defendants admit the allegations of paragraph two of the complaint and allege that the Board of Health is established pursuant to the provisions of the Municipal Code of Chicago and has the powers and is charged with the duties provided in said code.

16. The defendants have no knowledge or information sufficient to form a belief with respect to the truth of the allegations of paragraph 6(b) of the complaint, with the exception of the allegation contained in the last sentence thereof, which allegation is denied.

17. The defendants have no knowledge or information sufficient to form a belief with respect to the truth of the allegations of paragraph 7(a) of the complaint with the exception of the allegations of said paragraph to the effect that immersion of paper containers in paraffin sterilizes such containers, which allegations are denied.

18. Defendants deny the allegations of paragraph 7(b) of the complaint.

19. With respect to the allegations of paragraph nine of the complaint defendants deny that the paper containers therein referred to are sterile, and deny that said containers comply with the ordinances of the City of Chicago. With respect to the truth of the remaining allegations of said paragraph nine of the complaint the defendants have no knowledge or information sufficient to form a belief.

20. The defendants admit the allegations of paragraph ten of the complaint.

21. With respect to the allegations of paragraph eleven of the complaint, defendants say that the ordinance of the City of Chicago requiring that milk sold in quantities of less than one gallon be delivered in standard milk bottles was adopted for the protection of the health of the inhabitants of the City of Chicago. By inspection of the bactericidal methods and other processes employed in connection with the washing of standard milk bottles before they are filled with milk, it is possible to insure against contamination of the milk by its delivery container. Paper milk containers are not and cannot be subjected to effective bactericidal treatment before they are filled with milk and their sanitary condition depends upon conditions existing in distant paper mills and distant processing plants. The sanitary condition of these paper mills and processing plants varies from day to day and from hour to hour. The Board of Health and its members are without power to adopt any rules or regulations or to issue any permits whatsoever in violation of any ordinance of the City of Chicago.

22. The defendants admit the allegations of paragraph thirteen of the complaint, and allege that in making the application referred to in said paragraph Mr. S. E. Dean, the president of the plaintiff, said:

"We would like to make application to meet the Board of Health as soon as possible in order to present to them the facts regarding delivering milk to the City of Chicago in paper containers instead of bottles."

23. Defendants admit that the United States Public Health Service adopted, among other recommendations with respect to paper milk containers, the recommendations set forth in paragraph 14(a) of the complaint. The language of the ordinance of the City of Chicago involved in this case was identical with the language of the standard milk ordinance recommended by the United States Public Health Service. When the United States Public Health Service decided to amend its standard milk ordinance and code to include regulations governing the manufacture and processing of paper milk containers it realized that regulations concerning the manufacture and processing of paper containers could not logically be included in an ordinance which required that milk be delivered in standard milk bottles. It therefore recommended amendment of its ordinance by the insertion of the words "or in single-service containers" immediately after the words "standard milk bottles."

24. Defendants deny the allegations of paragraph 14(b) of the complaint.

25. Defendants admit the allegations of paragraphs 15(a) and 15(b) of the complaint, but deny the allegations of paragraph 15(c) of the complaint.

26. Defendants have no knowledge or information sufficient to form a belief with respect to the truth of the allegations of paragraph 16 of the complaint with respect to inspections of the plant of the plaintiff by the State of Illinois. The defendants admit no license or permit has been issued to the plaintiff to sell milk in Chicago in single-

service containers, and allege that the sale of milk in such containers is prohibited by a valid ordinance of the City of Chicago.

27. With respect to the allegations of paragraph 17 of the complaint as to the relations between the plaintiff and its customers or prospective customers, the defendants have no knowledge or information sufficient to form a belief. The defendants deny the remaining allegations in said paragraph.

28. The defendants deny the allegations of paragraph 18(a) and paragraph 18(b) of the complaint.

29. The defendants admit the allegations of paragraph 18(c) of the complaint but allege that because of the nature of the products there enumerated their sale in paper containers does not involve a health hazard in any way comparable to that involved in the sale of milk in paper containers.

30. With respect to the allegations of paragraph 19 of the complaint, defendants deny that any conditions exist in connection with the process of washing and sterilizing standard milk bottles in the City of Chicago which are inimical to the public health.

31. With respect to the allegations in paragraph 20 of the complaint, defendants admit that the ordinances of the City of Chicago, pertaining to the production, processing and distribution of milk, will be enforced and that the violation of said ordinances will be prosecuted. Defendants deny the remaining allegations of said paragraph.

32. Defendants deny the allegations of paragraph 23 of the complaint.

33. Defendants deny the allegations of paragraph 24 of the complaint.

34. Defendants deny the allegations of paragraph 25 of the complaint.

35. Defendants deny that the plaintiff will suffer any immediate, irreparable injury by reason of the matters and things alleged in the complaint and in the alternative allege that if the plaintiff is entitled to any relief whatsoever because of the matters and things set forth in the complaint its remedy therefore at law is plain, adequate and complete.

City of Chicago, a Municipal Corporation; Edward J. Kelly, as Mayor of the City of Chicago; James P. Allman, as Commissioner of Police; Herman N. Bundesen, as President of the Board of Health of the City of Chicago; and Francis A. Dulak, Harry J. Reynolds, Louis E. Schmidt and Lloyd Arnold, as Members of the Board of Health of the City of Chicago,

Defendants,

Filed May 21, 1940.

AFFIDAVIT OF WALTER V. SCHAEFER.

STATE OF ILLINOIS, }
COUNTY OF COOK. } ss.

Walter V. Schaefer, being first duly sworn, on oath says:

I am an Assistant Corporation Counsel of the City of Chicago. As such I am charged with the conduct of the case of *Fieldcrest Dairies Inc.* v. *City of Chicago et al.*, No. 316 in the United States District Court for the Northern District of Illinois, Eastern Division, and with the conduct of the case at bar. The plaintiff in the case of *Fieldcrest Dairies, Inc.* v. *City of Chicago et al.*, is a wholly owned subsidiary of the Dean Milk Company, the plaintiff in the case at bar. Said case pending in the United States District Court involves the construction and the validity of the identical ordinance of the City of Chicago the construction and validity of which are involved in the case at bar. The issues in the two cases are identical. The paper milk

container which is involved in the case pending in the United States District Court is precisely the same paper container which is involved in the case at bar, even to the identical printing which appears upon both of said containers.

The case pending in the United States District Court was instituted in that court on February 2, 1939. Thereafter said case was duly referred by the District Court to a Master in Chancery and extensive hearings upon the merits were had before the Master. The testimony of numerous expert witnesses in behalf of the plaintiff and of one expert witness in behalf of the defendants was taken. The record in said case consists of 2214 pages of testimony and more than 90 exhibits which were offered and received in behalf of plaintiff and more than 30 exhibits which were offered and received in behalf of the defendants.

On December 19, 1939 the plaintiff's brief was filed with the Master in Chancery of the District Court, consisting of 191 printed pages. On January 27, 1940 the brief in behalf of the defendants was filed with the Master, consisting of 58 printed pages. On February 15, 1940 the reply brief of the plaintiff was filed with the Master, consisting of 58 printed pages. On April 27, 1940 the report of the Master in Chancery, recommending a decree in favor of the defendants and against the plaintiff, was filed in the office of the clerk of the United States District Court. A copy of said report of the Master in Chancery is attached hereto and marked "Exhibit A." On May 7, 1940 the objections of the plaintiff to the report of the Master were filed with the clerk of the United States District Court.

On May 14, 1940 I appeared in behalf of the defendants before the Honorable Charles E. Woodward, one of the

judges of the United States District Court, and requested the entry of a decree in accordance with the report of the Master in Chancery. At that time I urged that the court fix an early date for the hearing upon the objections of the plaintiff to the report of the Master and upon the motion of the defendants for the entry of a decree in accordance with the said report. At that time the attorney for *Fieldcrest Dairies, Inc.*, refused to agree to an early hearing upon the objections to the report of the Master and upon the motion of the defendants for the entry of a decree in accordance therewith and stated to the court that there was no urgency in connection with the disposition of the case.

Thereafter the complaint in the case at bar was filed.

WALTER V. SCHEAFER.

Exhibit "A", attached to affidavit is a copy of Master's Report filed April 25, 1940 in *Fieldcrest Dairies, Inc.* v. *City of Chicago, et al.*, U. S. Dist. Ct. No. 316, incorporated in record in *City of Chicago, et al.* v. *Fieldcrest Dairies*, Supreme Court of the United States, Oct. Term 1941, No. 706; Rec. 1710-1736.

AFFIDAVIT OF LLOYD ARNOLD.

STATE OF ILLINOIS, }
COUNTY OF COOK. } ss.

Lloyd Arnold, being first duly sworn on oath, says:

I am a member of the Board of Health of the City of Chicago and one of the defendants in this cause. I am a professor of the University of Illinois College of Medicine, in charge of the Department of Bacteriology and Public Health. I have held that position since 1927. I received my medical education at Tulane University Medical School in New Orleans, the University of London and Oxford University in England, the Institute of Tropical Medicine in Hamburg, Germany, and the Universities of Goettingen, Munich and Tuebingen, also in Germany. I also attended the medical school at Vanderbilt University in Tennessee. Prior to the time when I became associated with the University of Illinois I was Professor of Bacteriology, Pathology and Public Health at Loyola University Medical School in the City of Chicago.

I am familiar with the manufacture of paper for use in paper milk containers and with the subsequent steps in the processing and handling of that paper in the manufacture of paper milk containers. I am familiar also with the sanitary and bacteriological conditions existing in paper mills and in connection with the handling and processing of paper into paper milk containers.

Paraffined paper milk containers as presently available are uniformly absorbent. The effect of the absorbency of these containers is that any bacteria which are present in the walls of the paper container can be and are transmitted to the milk placed in the containers. Bacteria are present in the walls of paper milk containers. The sanitary condi-

tion of paper milk containers depends to a very considerable extent upon the degree of sanitation achieved by the paper mill in which the paper is manufactured.

The sanitary condition of the paper containers also depends upon the purity of the water supply used in the paper mill in which the paper is manufactured. The ordinary source of the water supply of a paper mill is river water which in almost all instances contains sewage. Sewage bacteria have been found in the water supply of the paper mill in which the paper used in making the containerse involved in this case are produced.

The paper containers involved in this caes contain toxic substances, namely, leads, which are used in the ink which is used in printing said containers. This ink, by a process known to the printing trade as "offsetting," is transmitted from the outside of one paper container blank to the inside of the one next adjacent.

The immersion of paper milk containers in paraffin does not have a bactericidal effect and no effective bactericidal treatment is given to paper milk containers prior to the time when they are filled with milk.

In my opinion the requirement of the ordinance of the City of Chicago that milk sold in quantities of less than one gallon be delivered in standard milk bottles serves to protect the health of the inhabitants of the City of Chicago, and the use of paper milk containers of the type now available and of the type advocated by the plaintiff would involve hazards to public health greater in degree and less possible of ascertainment and correction than are involved in the use of standard milk bottles.

From the point of view of the protection of the public health, a container in which milk is delivered should meet the following requirements:

(a) The surface of the container in contact with milk shall be smooth and unbroken. The surface of the container in contact with milk shall be impermeable and non-porous.

(b) The surface of the container in contact with milk shall be sterile or constructed of such materials that it can be disinfected in the dairy before use.

(c) The contents of the container shall not be contaminated by microorganisms, chemicals or other substances contained in the material forming the wall.

The paper containers presently available, including the container advocated by the plaintiff, do not meet these requirements.

(Signed) LLOYD ARNOLD.

Subscribed and sworn to before me this 21st day of May, 1940.

(Seal) Margaret M. Smith,
Notary Public.

Forasmuch as the matters and things above set forth do not fully appear of record, the defendants tender this, the report of the proceedings at the trial in the above entitled cause, consisting of the affidavits submitted by the defendants on the hearing before the court upon the motion of the plaintiff for the issuance of a temporary injunction, and pray that the same may be signed, sealed and certified as correct by the Honorable William V. Brothers, Trial Judge; and the undersigned being said Trial Judge hereby certifies that upon the hearing of said motion there were submitted to the court the sworn complaint of the plaintiff, the sworn answer of the defendants, and the foregoing affi-

davits; that no other evidence was offered upon the hearing of said motion.

WM. V. BROTHERS,
Judge of the Circuit Court of Cook County.

Text of Temporary Injunction Entered May 21, 1940.

This cause coming on to be heard upon the motion of the plaintiff for the issuance of a temporary injunction against the defendants, City of Chicago, a Municipal Corporation; Edward J. Kelly, as Mayor of the City of Chicago; James P. Allman, as Commissioner of Police; Board of Health of the City of Chicago; Herman N. Bundesen, as President of the Board of Health of the City of Chicago; and Francis A. Dulak, Harry J. Reynolds, Louis E. Schmidt and Lloyd Arnold, as members of the Board of Health of the City of Chicago, due notice of said motion having been served upon said defendants, the court having considered the verified complaint heretofore filed herein by the plaintiff, having heard the arguments of counsel and being fully advised in the premises, and

The Court finds that the single service containers or "Pure-Pak" containers used by plaintiff are within the

contemplation of the term "standard milk bottles" as used in the Municipal Code of the City of Chicago.

It Is Ordered, Adjudged and Decreed that a writ of injunction issue herein forthwith directed to and restraining and enjoining the defendants, City of Chicago, a Municipal corporation; Edward J. Kelly, as Mayor of the City of Chicago; James P. Allman, as Commissioner of Police; Board of Health of the City of Chicago; Herman N. Bundesen, as President of the Board of Health of the City of Chicago; and Francis A. Dulak, Harry J. Reynolds, Louis E. Schmidt and Lloyd Arnold, as members of the Board of Health of the City of Chicago, and each of them from:

(a) In any manner or by any means from interfering with, obstructing, or hindering the plaintiff from the sale and distribution of its Grade "A" Pasteurized milk or milk products in single service containers or containers known as "Pure-Pak" containers within the City of Chicago, on the ground that they are not standard milk bottles.

(b) From prosecuting the plaintiff in any action at law or in equity or in any criminal action purporting or alleged to arise out of the so-called violation by plaintiff of the ordinances of the Municipal Code of the City of Chicago regarding the sale of Grade "A" pasteurized milk in single service containers or "Pure-Pak" containers in the City of Chicago.

(c) From arresting, molesting, annoying, injuring, harming, or abusing plaintiff or its officers, agents, and servants in the sale and distribution of plaintiff's Grade "A" pasteurized milk and milk products in single service containers or "Pure-Pak" containers within the City of Chicago.

(d) From confiscating, damaging, injuring or destroying any or all of plaintiff's Grade "A" pasteurized milk

or milk products contained in single service containers or "Pure-Pak" containers which at any time or times may be within the corporate confines of the City of Chicago.

(e) From continuing to refuse and failing to issue to the plaintiff a permit to pasteurize Grade "A" milk at its plant in Chemung, Illinois, and from continuing to refuse and failing to issue to the plaintiff a license to sell, offer for sale, expose for sale, dispose of, exchange, or deliver, the Grade "A" pasteurized milk or milk products of plaintiff packaged and contained in containers known as single service containers or "Pure-Pak" containers.

It Is Further Ordered that said writ of injunction issue upon the plaintiff's filing herein a bond in the sum of $500.00 with surety thereon, to be approved by the court within 5 days from date hereof.

It Is Further Ordered, Adjudged and Decreed that said injunction remain in force and effect until dissolved or altered by order or decree of this court.

It Is Further Ordered, Adjudged and Decreed that any notice of appeal filed by the defendants shall operate as a supersedeas without bond.

WM. V. BROTHERS,
Judge.

Dated: May 21, 1940.

Text of Notice of Appeal Filed May 21, 1940.

City of Chicago, a Municipal Corporation; Edward J. Kelly, as Mayor of the City of Chicago; James P. Allman, as Commissioner of Police; Board of Health of the City of Chicago; Herman N. Bundesen, as President of the Board of Health of the City of Chicago; and Francis A. Dulak,

Harry J. Reynolds, Louis E. Schmidt and Lloyd Arnold, as members of the Board of Health of the City of Chicago, defendants-appellants, hereby appeal to the Appellate Court of Illinois, First District, from the interlocutory order of the Circuit Court of Cook County entered in this cause on the 21st day of May, 1940, wherein the court, after considering the sworn complaint of the plaintiff, the sworn answer of the defendants, and certain affidavits submitted by the defendants, held for the plaintiff-appellee, Dean Milk Company, an Illinois Corporation, and ordered, adjudged and decreed:

That a writ of injunction issue forthwith restraining and enjoining the defendants and each of them from:

(a) In any manner or by any means from interfering with, obstructing, or hindering the plaintiff from the sale and distribution of its Grade "A" Pasteurized milk or milk products in single service containers or containers known as "Pure Pak" containers within the City of Chicago, on the ground that they are not standard milk bottles.

(b) From prosecuting the plaintiff in any action at law or in equity or in any criminal action purporting or alleged to arise out of the so-called violation by plaintiff of the ordinances of the Municipal Code of the City of Chicago regarding the sale of Grade "A" pasteurized milk in single-service containers or "Pure-Pak" containers in the City of Chicago.

(c) From arresting, molesting, annoying, injuring, harming, or abusing plaintiff or its officers, agents, and servants in the sale and distribution of plaintiff's Grade "A" pasteurized milk and milk products in single-service containers or "Pure-Pak" containers within the City of Chicago.

(d) From confiscating, damaging, injuring or destroying any or all of plaintiff's Grade "A" pasteurized milk

or milk products contained in single-service containers or "Pure-Pak" containers which at any time or times may be within the corporate confines of the City of Chicago.

(e) From continuing to refuse and failing to issue to the plaintiff a permit to pasteurize Grade "A" milk at its plant in Chemung, Illinois, and from continuing to refuse and failing to issue to the plaintiff a license to sell, offer for sale, expose for sale, dispose of, exchange, or deliver, the Grade "A" pasteurized milk or milk products of plaintiff packaged and contained in containers known as single service containers or "Pure-Pak" containers.

The defendants-appellants pray that said order may be reversed.

City of Chicago, a Municipal Corporation; Edward J. Kelly, as Mayor of the City of Chicago; James P. Allman, as Commissioner of Police of the City of Chicago; Board of Health of the City of Chicago; Herman N. Bundesen, as President of the Board of Health of the City of Chicago; and Francis A. Dulak, Harry J. Reynolds, Louis E. Schmidt and Lloyd Arnold, as members of the Board of Health of the City of Chicago.

B. APPELLATE COURT PROCEEDINGS—MAY 22 TO JUNE 4, 1940.

STATEMENT OF COUNSEL SUMMARIZING APPELLATE COURT PROCEEDINGS.

Section 78 of the Illinois Civil Practice Act (Illinois Revised Statutes 1941, Chapter 110, "Practice," Para. 202), provides for an appeal from an interlocutory order granting an injunction. The statute cited provides that such interlocutory order and the proceedings in the court below shall not be stayed during the pendency of such appeal except upon order of the Appellate Court or of a judge thereof in vacation.

The appeal of the defendants from the interlocutory injunction of the Circuit Court of Cook County was docketed in the Appellate Court of Illinois for the First District under the title of "Dean Milk Company, an Illinois Corporation, Appellee, *vs.* City of Chicago, a municipal corporation, *et al.*, Appellants, General Number 41348," on May 22, 1940.

On the same day, upon due notice, the defendants, including the City of Chicago, made a motion in the Appellate Court to enter an order staying the force and effect of the interlocutory injunction of the Circuit Court of Cook County entered May 21, 1940. In support of said motion the defendants filed suggestions under oath stating, among other things, that the trial court should not have entered the injunction because of the pendency of the proceedings in the United States District Court referred to in paragraph 12 of the defendants' answer and referred to in the affidavit in opposition to the motion for a temporary injunction.

On the same day, May 22, 1940, the Appellate Court entered an order that having examined the record filed herein and the arguments of counsel, the injunctional order of May 21, 1940, of the Circuit Court of Cook County should be stayed without bond pending the final disposition of the appeal in the Appellate Court.

On May 29, 1940, upon due notice, the plaintiff, Dean Milk Company, a corporation, of which Fieldcrest Dairies, Inc., is a wholly-owned subsidiary, confessed in writing "that there was manifest error in the rendition of the interlocutory order of the Circuit Court of Cook County entered on May 21, 1940, from which the appeal is prosecuted in this cause" and made a motion to reverse the interlocutory order.

On the same day, May 29, 1940, the City of Chicago and other defendants moved the Appellate Court:

> "(1) To include in the order of this Honorable Court reversing said order of May 21, 1940, directions to the trial court to dismiss the cause in that court on the ground that the plaintiff-appellee has an adequate remedy at law;
>
> "(2) In the event of the refusal by this Honorable Court to direct the dismissal of the above entitled cause as aforesaid, then these defendants-appellants move this Honorable Court to include in its order, reversing said order of May 21, 1940, directions to the trial court to stay proceedings in the above entitled cause until the determination of the suit pending in the United States District Court for the Northern District of Illinois, Eastern Division."

On May 31, 1940, the plaintiff, Dean Milk Company, filed counter-suggestions in opposition to said motion of the appellants (defendants).

On June 3, 1940, the defendants filed a written reply to the plaintiff's suggestions in which among other things the defendants stated:

"Our motion that this Honorable Court direct the trial court to stay proceedings in the above entitled cause until the determination of the suit pending in the United States District Court, does not ask this court to pass upon the merits of this case. Such an order would not affect in any manner or to any extent the right of the plaintiff-appellee to obtain at the proper time all remedy sought by its suit if it shall show itself to be entitled thereto.

"This was an action in equity in the trial court and it is an action in equity on this appeal. The record in this case discloses a situation (discussed under Point IV of Appellants' brief, pp. 31-34) which should have persuaded the trial court, sitting in chancery, and should now persuade this Honorable Court, on this chancery appeal, to stay proceedings in this cause until the litigation in the Federal court can be determined. The City of Chicago incurred considerable expense in the Federal court litigation instituted and carried on by the wholly owned subsidiary of the plaintiff in the case at bar. The case at bar involves the same issues and the same paper carton. The paper carton attached as an exhibit to the plaintiff's pleading in this case is a duplicate of the paper carton attached as an exhibit to the pleading of the plaintiff in the Federal court case. Every equitable consideration arising from the facts in this case is favorable to the contention of the city that it should not be forced to bear the repetition of the expense of a protracted trial because of any alleged urgency connected with the case, in view of the action of the wholly owned subsidiary of the plaintiff in preventing an early determination of the Federal court litigation by insisting that there was no urgency.

"The necessity for the exercise by this court of the power granted to it to 'direct such proceedings to be had in the court below as the justice of the case may require,' and in the exercise of that power to direct the trial court to stay proceedings herein until the litigation in the Federal court can be determined, is indicated by two statements made in the suggestions of the plaintiff-appellee."

On June 4, 1940, the Appellate Court entered two orders which were as follows:

"On this day came again the said parties, and the Appellee having admitted and confessed that in the Record and proceedings aforesaid, and in the rendition of the Interlocutory Order of May 21, A. D. 1940 aforesaid there is Manifest Error: Therefore, it is considered by the Court that for that Error the Interlocutory Order of May 21, A. D. 1940, of the Circuit Court of Cook County in this behalf rendered, be reversed anulled, set aside and wholly for nothing esteemed in accordance with the confession of error filed herein.

"And it is further considered by the Court that the said Appellants recover of and from the said Appellee their costs by them in this behalf expended, to be taxed, and that they have execution therefor."

"The Court having considered Appellants' motion to include in the order of reversal an order directing the trial Court to dismiss the cause or to include in its order of reversal an order directing the trial court to stay proceedings in the above entitled cause until the determination of the suit pending in the United States District Court of the Northern District of Illinois, Eastern Division, as per suggestions filed herein, and having also considered the counter-suggestions of the Appellee to said motion, as well as Appellants' reply to said counter-suggestions filed herein, and being now fully advised in the premises doth order that said motion be and the same is hereby denied."

C. CIRCUIT COURT PROCEEDINGS—JUNE 18 TO DECEMBER 3, 1940.

STATEMENT OF COUNSEL SUMMARIZING FURTHER TRIAL COURT PROCEEDINGS.

On June 18, 1940, the mandate of the Appellate Court reciting the reversal entered in that court June 4, 1940, was filed in the Circuit Court of Cook County and further proceedings were had in that court as follows:

Upon due notice, on the same day, June 18, 1940, the plaintiff filed an Amended and Supplemental Complaint consisting of two parts. The first part made substantially the same allegations as the original Complaint except that it alleged that on June 13, 1940, the City of Chicago had refused to issue a permit to the plaintiff, Dean Milk Company, to pasteurize and to sell within the City of Chicago its Grade A milk packed in single-service containers, "giving as an alleged reason for its said refusal that 'no facilities existed for the washing and filling of standard milk bottles' in plaintiff's plant at Chemung, Illinois, and because plaintiff is 'not prepared to distribute milk or milk products in standard milk bottles' from its plant in Melrose Park, Illinois." True copies of said refusals dated June 13, 1940, were attached to the Amended and Supplemental Complaint as Exhibits E and F. Exhibit E contained the language quoted in the allegation just mentioned prefaced by this statement:

> "An inspection of the plant and equipment was made on June 4, and it was found that this is the same plant for which a milk plant permit application was made in the name of Fieldcrest Dairies, Inc., a division of the Dean Milk Co., subsequent to which inspections were made a short time ago, when it was found that no facilities existed," etc.

Part two of said Amended and Supplemental Complaint was a separate action at law by the same plaintiff praying that a writ of mandamus be issued to compel the defendants to issue to the plaintiff a license to pasteurize and to sell milk in containers "known as single-service or 'Pure-Pak' containers." Part two of the Amended and Supplemental Complaint adopted the allegations of part one by reference and alleged generally that the plaintiff had complied in all particulars with all requirements entitling it to the issuance of a permit for the sale of milk in single-service or Pure-Pak containers within the City of Chicago.

On June 25, 1940, the defendants, upon due notice to the plaintiff, filed a motion in writing "that this Honorable Court stay proceedings in this case pending the disposition of the case entitled '*Fieldcrest Dairies, Inc., a corporation,* Plaintiff v. *City of Chicago, a municipal corporation, et al.,* Defendants,' which is now pending as No. 316 in the District Court of the United States for the Northern District of Illinois, Eastern Division. And in support of said motion the defendants present herewith their sworn petition."

The said petition averred under oath the following, omitting the caption, signatures and verification:

Text of Defendants' Petition to Stay Proceedings Filed June 25, 1940.

The defendants, by Barnet Hodes, Corporation Counsel of the City of Chicago, their attorney, respectfully represent to this Honorable Court:

1. Fieldcrest Dairies, Inc., a Michigan corporation, authorized to do business in the State of Illinois, is a wholly owned subsidiary of the plaintiff in the case at bar, the

Dean Milk Company. On February 2, 1939 Fieldcrest Dairies, Inc., instituted a suit in the District Court of the United States for the Northern District of Illinois, Eastern Division, against the City of Chicago and its Board of Health, which suit is pending in said Court as *Fieldcrest Dairies, Inc., a corporation*, plaintiff v. *City of Chicago, a municipal corporation, et al.*, defendants, No. 316. That case involves the identical paper milk container and the construction and validity of the identical provision of the ordinance of the City of Chicago which are involved in the case at bar.

2. In that case a full trial upon the merits has been had before a Master in Chancery duly appointed by the United States District Court. Upon that trial the testimony of very many expert witnesses was introduced with respect to the meaning and validity of the identical ordinance which is involved in this case and with respect to the sanitary and unsanitary characteristics of the Pure-Pak paper milk containers which are also involved in this case.

3. Two thousand two hundred and fourteen pages of testimony were taken in said case and more than 90 exhibits were offered and received in behalf of the plaintiff and more than 30 exhibits were offered and received in behalf of the defendants. After proofs were closed in said case a printed brief of 191 pages was filed in behalf of the plaintiff. Thereafter an answering printed brief of 58 pages was filed in behalf of the defendants. Subsequently a printed reply brief of 58 pages was filed in behalf of the plaintiff.

4. Thereafter, on April 27, 1940, the report of Honorable Jacob I. Grossman, Master in Chancery of the United States District Court for the Northern District of Illinois, was duly filed in said court. The report of said

Master in Chancery decided the issues (which are identical with the issues in the case at bar) in favor of the defendants. A copy of said report of the Master in Chancery is attached hereto, marked Exhibit 1. [*Note:* This is the report set forth in the record, Vol. III, pp. 1710-1736, *City of Chicago* v. *Fieldcrest Dairies, Inc.*, Oct. Term, 1941, No. 706, and is here omitted in printing.]

5. Thereafter, on May 7, 1940, the objections of plaintiff to the report of the Master in Chancery were duly filed with the Clerk of said court. Thereafter, on May 14, 1940, a motion was duly made in behalf of the defendants for the entry of a decree in accordance with said report. Upon the ground that there was no urgency in the disposition of the matter before the District Court, the plaintiff refused to agree to the defendants' request for a prompt hearing upon the objections to the report of the Master and the motion of the defendants for the entry of a decree. On the next day, May 15, 1940, the case at bar was instituted in this court.

6. The plaintiff in said case pending in the United States District Court is the wholly owned subsidiary of the plaintiff in the case at bar and is under the complete control and domination of the plaintiff in the case at bar. The disposition of the case pending in the United States District Court is being deliberately delayed by the plaintiff and its subsidiary in order to secure a re-trial of identical issues in the case at bar. All of the evidence necessary for the complete determination of the issues presented in the case at bar has been offered and received in the case pending in the United States District Court and a re-trial of those issues in the case at bar will result only in the imposition of additional expense upon the taxpayers of the City of Chicago.

Wherefore defendants pray that an order be entered by this Honorable Court staying proceedings in this case until the disposition of the case entitled *Fieldcrest Dairies, Inc.* v. *City of Chicago, et al.*, No. 316 in the District Court of the United States for the Northern District of Illinois, Eastern Division.

On June 25, 1940, an order was entered continuing the motion of the defendants to stay the proceedings to the first hearing of the contested motion calendar of the trial judge, in September, 1940.

On July 2, 1940, the defendants filed an answer to the amended and supplemental complaint, which, with respect to part one was identical with the original answer to the original complaint set forth above. The answer to part two, being the action at law in mandamus, adopted by reference the defendants' answer to paragraphs 1 to 25 of part one of the answer and denied generally the allegations that the plaintiff had complied with the requirements necessary for a license to sell milk in the City of Chicago in single-service or Pure-Pak containers and denied plaintiff's alleged right to a writ of mandamus. Said answer to the amended and supplemental complaint was under oath.

On July 3, 1940, on motion of the plaintiff, the cause was set for hearing on September 9, 1940.

On September 9, 1940, by leave of court, plaintiff filed a supplement to the Amended and Supplemental Complaint.

Text of Supplement to Amended and Supplemental Complaint.

Now comes the Plaintiff, Dean Milk Company, a corporation duly organized and existing under and by virtue of the laws of the State of Illinois, by Charles O. Rundall and Horace A. Young, its attorneys, and by leave of court first had and obtained files this its Supplement to Amended and Supplemental Complaint against the Defendants City of Chicago, a Municipal corporation; Edward J. Kelly, as Mayor of the City of Chicago; James P. Allman, as Commissioner of Police; Board of Health of the City of Chicago; Herman N. Bundesen, as President of the Board of Health of the City of Chicago; and Francis A. Dulak, Harry J. Reynolds, Louis E. Schmidt and Lloyd Arnold, as members of the Board of Health of the City of Chicago, and alleges as follows:

SEPARATE ACTION IN CHANCERY.

(1) That since the filing of its Amended and Supplemental Complaint herein on June 18, 1940, certain additional events have transpired which are material and pertinent to the issues involved in this cause, and in this its Supplement to Amended and Supplemental Complaintiff Plaintiff sets forth such additional events.

(2) That at a meeting of the Board of Health of the City of Chicago held at the offices of the Board on August 15, 1940, at which meeting the Defendants Herman N. Bundesen, Francis A. Dulak, Louis E. Schmidt and Lloyd Arnold were present, said Herman N. Bundesen presented to the Board a written memorandum of certain proceedings before the Board, consisting of ten (10) or more typewritten pages. In said written memorandum, which Plain-

tiff will require said Defendants to produce upon the hearing of this cause, said Herman N. Bundesen stated in substances that the Board prepared a letter dated June 3, 1940, to be sent to Plaintiff in which letter the Board stated that before action would be taken by the Board upon the request of Plaintiff for the issuance of certain permits, the Board wished to be informed that it was the plan of Plaintiff to distribute milk and milk products in the City of Chicago in standard milk bottles and not in single-service containers, but, that upon the advice of Fred V. Maguire, Assistant Corporation Counsel of the City of Chicago, said letter was never sent. Said Defendant further stated that acting upon the advice of said Fred V. Maguire and with the assistance of said Fred V. Maguire, the Board prepared and sent to Plaintiff the letter dated June 13, 1940, a copy of which is attached to the Amended and Supplemental Complaint heretofore filed herein as "Exhibit E" thereto, in which letter the reason for the refusal of the permits was given as the lack of facilities for the washing and filling of standard milk bottles. Said Defendant further stated that the Board had been informed that subsequent to June 13, 1940, Plaintiff had made alterations in its plant to provide equipment for washing and filling standard one-half gallon glass containers for milk and milk products, to be distributed to prospective customers in Chicago until the use of paper containers shall be approved and that on August 4, 1940, Inspector A. W. Kitley inspected said plant and found that the plant, equipment and methods were in full compliance with the ordinances and the rules and regulations of the Board of Health. After a discussion of the memorandum presented by said Herman N. Bundesen and the matters therein contained, the Board unanimously passed the following resolutions:

"BE IT RESOLVED, that milk plant and milk distributor's permits (Numbered 37) be issued to the Dean Milk Company."

"BE IT RESOLVED, that the application of the Dean Milk Company for a milk distributor's license be approved and the City Collector so advised."

(3) That pursuant to said resolutions there were issued to Plaintiff on August 16, 1940, a milk plant permit for its plant at Chemung, Illinois, a photostatic copy of which permit is hereto attached, marked "Exhibit A" and hereby made a part hereof, a milk distributor's permit at 2511 West Lake Street, Melrose Park, Illinois, a photostatic copy of which is hereto attached, marked "Exhibit B" and hereby made a part hereof, and permits for five vehicles, Nos. 27 to 31, inclusive.

(4) That on August 22, 1940, there was also issued to Plaintiff a food distributor's permit for a store located at 3819 Southport Avenue, Chicago, Illinois, and pursuant to such permit Plaintiff opened said store for business on August 23, 1940, and there offered for sale various dairy and poultry products. On Thursday, August 29, 1940, Plaintiff announced that on Friday, August 30, 1940, it would sell at its said store located at 3819 Southport Avenue, Chicago, Illinois, its Grade A pasteurized milk and milk products packaged in single-service containers commonly known as paper bottles, and that such announcement was made by means of hand bills distributed in the vicinity of said store and by a statement sent to the public press and to the Board of Health.

(5) That pursuant to said announcement Plaintiff did on Friday, August 30, 1940, proceed to offer for sale and sell its Grade A pasteurized milk and milk products packaged in single-service containers commonly known as paper bottles at its said store and continued such sales

until the late afternoon of that day. Plaintiff learned at or about 3:00 o'clock in the afternoon of that day that a special meeting of the Board of Health had been called to consider the revocation of the permits theretofore issued to Plaintiff as above described. Present at such meeting of the Board of Health were the Defendants Herman N. Bundesen, Harry J. Reynolds and Louis E. Schmidt, and also one Fred V. Maguire, Assistant Corporation Counsel. Dairy Inspector Kruger reported to the Board that Plaintiff had on that day sold milk in single-service containers, commonly known as paper bottles, in the City of Chicago in alleged violation of the ordinances of the City of Chicago and that therefore he recommended the revocation of the permits theretofore issued to Plaintiff; that thereupon the Defendant Herman N. Bundesen inquired of said Fred V. Maguire, Assistant Corporation Counsel, as to whether or not the Board of Health had any alternative in the matter of revoking the permits and that said Fred V. Maguire then and there advised said Herman N. Bundesen and the other members of the Board present that the Board had no alternative of any kind in the premises and that the Board was obligated by law to revoke such permits; that thereupon, and over the vigorous protests and objections of Plaintiff's representatives, a resolution was unanimously passed by the three members of the Board present purporting to revoke such permits. Plaintiff alleges that it had fully complied with all lawful requirements entitling it to the above described permits, and after the issuance of said permits Plaintiff did no act which warranted any revocation thereof, and the action of the Defendant Board of Health and said individual Defendants as members of the Board of Health was wrongful and without warrant in law.

(6) That since the purported revocation of said permits, Plaintiff has not sold any of its Grade A pasteurized milk and milk products in the City of Chicago.

(7) That since the purported revocation of said permits, the Defendants have failed and refused to rescind the purported revocation and have failed and refused to issue new permits to Plaintiff.

WHEREFORE, Plaintiff prays for the same relief as prayed for in its Amended and Supplemental Complaint filed herein and that Defendants be ordered and directed to rescind their action in connection with such purported revocation and to restore or re-issue to Plaintiff said permits and for such other, further and different relief as the foregoing allegations may justify and to the Court may seem meet.

SEPARATE ACTION AT LAW.

Now comes Dean Milk Company, a corporation, duly organized and existing under and by virtue of the laws of the State of Illinois, by Chas. O. Rundall and Horace A. Young, its attorneys, and complains of all the Defendants above named and alleges as follows:

(1) Pursuant to Rule 11 of the Rules of Practice of the Supreme Court of Illinois, Plaintiff hereby adopts by this reference thereto all of the allegations made in paragraphs (1) to (7) of the above and foregoing Supplement to Amended Supplemental Complaint and by this reference thereto hereby incorporates all of said allegations into this separate action at law.

(2) Plaintiff has complied in all particulars with all requirements entitling it to the issuance or re-issuance of a permit or license to pasteurize and to sell, offer for sale, expose for sale, dispose of, exchange or deliver the

Grade A Pasteurized milk or milk products of Plaintiff packaged or contained in containers known as single-service containers or "Pure-Pak" containers, commonly known as paper bottles, within the City of Chicago.

WHEREFORE, Plaintiff prays for the same relief prayed for in its Amended and Supplemental Complaint filed herein or in the alternative that a writ of mandamus be issued directing and compelling said Defendants Board of Health of the City of Chicago, Herman N. Bundesen as President of the Board of Health of the City of Chicago, and Francis A. Dulak, Harry J. Reynolds, Louis E. Schmidt and Lloyd Arnold as members of the Board of Health of the City of Chicago, to restore or re-issue to the Plaintiff said permits or licenses which are purported to have been so revoked and for such other and further relief as to the Court may seem meet in the premises.

DEAN MILK COMPANY, an Illinois Corporation,
By (Signed) SAM E. DEAN,
Its President and Duly Authorized Agent.

(Signed) CHAS. O. RUNDALL,
(Signed) HORACE A. YOUNG,
Attorneys for Plaintiff.

Attached to said Supplement to Amended and Supplemental Complaint as exhibits were two permits dated August 15, 1940, bearing Permit No. 37, issued by the Board of Health, City of Chicago, the first permit reciting in substance the following:

> "A Permit is hereby granted to Dean Milk Co., Chemung, Illinois subject to ordinances of the City of Chicago, and the rules and regulations of the Board of Health of the City of Chicago, to operate a Milk Plant.

"This permit may be revoked when the holder thereof fails to comply with any of the ordinances of the City of Chicago or rules and regulations of the Board of Health of the City of Chicago.

"This permit is not transferable and is issued only for the person and premises named herein.

"By Direction of the Board of Health."

The second permit recited in substance the following:

"A Permit is hereby granted to Dean Milk Co., 2541 West Lake Street, Melrose Park, Illinois, subject to ordinances of the City of Chicago, and the rules and regulations of the Board of Health of the City of Chicago, to operate as a Milk Distributor."

The balance of the permit was the same as the previous exhibit.

On September 9, 1940, the hearing on defendants' motion for a stay of proceedings pending disposition of the case of Fielderest Dairies, Inc., against City of Chicago, United States District Court No. 316, was continued to October 21, 1940.

On September 19, 1940, the defendants filed their answer to the supplement to the amended and supplemental complaint, which, omitting the introductory matter and signatures, was as follows:

Answer to Supplement to Amended and Supplemental Complaint.

ANSWER TO SEPARATE ACTION IN CHANCERY.

(1) Defendants deny that any events alleged in said supplement to have occurred after the filing of the plaintiff's amended and supplemental complaint herein are material or pertinent to the issues involved in this cause.

(2) Defendants admit the allegations of paragraph 2 of said supplement.

(3) Defendants admit the allegations of paragraph 3 of said supplement.

(4) Defendants admit the allegations of paragraph 4 of said supplement.

(5) Defendants admit the allegations of paragraph 5 of said supplement excepting as to the following:

Defendants deny the allegation that the defendant, Herman N. Bundesen, at the meeting of the Board of Health held August 30, 1940, enquired of Fred V. Maguire, Assistant Corporation Counsel, as to whether or not the Board of Health had any alternative in the matter of revoking the permits theretofore issued to the plaintiff, and further deny that said Fred V. Maguire then and there advised said Herman N. Bundesen and the other members of the Board of Health present, that the board had no alternative of any kind in the premises or that the board was obligated by law to revoke said permits or that any advice given said Herman N. Bundesen, and the other members of the Board of Health present, by said Fred V. Maguire concerning the revocation of said permits was in subject or effect as alleged in said supplement.

Defendants state that the resolution unanimously adopted by the members of the Board of Health present did legally revoke and terminate the permits theretofore issued to the plaintiff by the said board.

Defendants deny that after the issuance of said permits the plaintiff did no act which warranted any revocation thereof and further deny that the action of said Board of Health, and the members thereof as such, was wrongful or without warrant in law.

Defendants further state the fact to be that the sale of milk by the plaintiff in quantities of less than one gallon in paper containers, sometimes known as single-service containers, and not in standard milk bottles, was in violation of the ordinance of the City of Chicago in such case made and provided.

(6) Defendants have no knowledge or information sufficient to form a belief with respect to the truth of the allegations of paragraph 6 of said supplement and therefore neither admit nor deny said allegations but ask that the plaintiff may be required to make strict proof thereof if upon the trial of this cause said allegations shall be relevant or material.

(7) Defendants admit that the revocation of said permits has not been rescinded but state that no demand or request that said revocation be rescinded has been made upon or to said Board of Health by the plaintiff.

ANSWER TO SEPARATE ACTION AT LAW.

1. With respect to paragraph 1 of the separate action at law, the defendants adopt by this reference thereto their answer to paragraphs 1 to 7, both inclusive, to the separate action in chancery contained in the supplement to amended and supplemental complaint and by this reference thereto incorpoarte all of said answer.

2. Defendants deny the allegations of paragraph 2 of the separate action at law.

[On October 18, 1940, United States District Judge Charles E. Woodward filed a memorandum directing the entry of a decree in favor of Fielderest Dairies, Inc., against the City of Chicago and other defendants, Rec. Vol. III, pp. 1752-1756, *City of Chicago, et al., Petitioners,*

v. *Fieldcrest Dairies, Inc., Respondent,* October Term, 1941, No. 706.]

On October 21, 1940, the hearing of the state court proceeding was postponed by the Circuit Court of Cook County to October 22, 1940, on which day the hearing was again continued to October 23, 1940.

[On October 23, 1940, the United States District Judge entered findings of fact, conclusions of law and the decree now under review by the Supreme Court of the United States, Rec. Vol. III, pp. 1758-1761, *City of Chicago, et al., Petitioners,* v. *Fieldcrest Dairies, Inc., Respondent,* October Term, 1941, No. 706.]

On October 23, 1940, and dates following, the Circuit Court of Cook County postponed the state court proceeding from time to time until November 29, 1940, on which date the plaintiff, Dean Milk Company, filed a sworn petition.

Text of Plaintiff's Petition Filed November 29, 1940.

Your Petitioner, Dean Milk Company, respectfully represents:

(1) That heretofore and on to-wit, May 15, 1940, Plaintiff filed its Complaint in Chancery herein, asking for injunctive and other relief, and that thereafter and on May 21, 1940, an Interlocutory Injunction was entered herein, from which an appeal was taken by Defendants, or some of them, to the Appellate Court of Illinois; that thereafter error was confessed in the Appellate Court of Illinois on behalf of Plaintiff, and said cause was remanded and redocketed in this court.

(2) Thereafter and on June 18, 1940, Plaintiff filed herein its Amended and Supplemental Complaint by leave

of court first had and obtained, praying for injunctive relief and for relief by way of mandamus, all of which will more fully appear from the files and pleadings filed in said cause.

(3) Thereafter and on June 25, 1940, the Defendants filed herein their motion, supported by verified petition, to stay the proceedings in the above entitled cause pending the disposition of a certain suit or proceeding then pending in the District Court of the United States for the Northern District of Illinois, Eastern Division, known and described as "*Fieldcrest Dairies, Inc., a corporation,* Plaintiff, v. *City of Chicago, a Municipal corporation, et al.,* Defendants, No. 316." In said petition it was alleged that the suit just described "involves the identical paper milk container and the construction and validity of the identical provision of the ordinance of the City of Chicago which are involved in the case at bar." Said petition recited certain proceedings had in said cause pending in the District Court of the United States, and further alleged, among other things:

> "All of the evidence necessary for the complete determination of the issues presented in the case at bar has been offered and received in the case pending in the United States District Court and a re-trial of those issues in the case at bar will result only in the imposition of additional expense upon the taxpayers of the City of Chicago.
>
> "Wherefore defendants pray that an order be entered by this Honorable Court staying proceedings in this case until the disposition of the case entitled *Fieldcrest Dairies, Inc.* v. *City of Chicago, et al.,* No. 316 in the District Court of the United States for the Northern District of Illinois, Eastern Division."

(4) By order entered on June 25, 1940, hearing on said motion and petition was continued, to be taken up thereafter, and on July 2, 1940, Defendants filed herein their

Answer to the Amended and Supplemental Complaint of Plaintiff theretofore filed herein on June 18, 1940.

(5) Said motion and petition to stay proceedings herein came on for hearing before the Court on September 9, 1940, and after being partially heard were ordered continued for further hearing at 10:00 o'clock A. M. on October 25, 1940.

(6) On September 9, 1940, by leave of court first had and obtained, Plaintiff filed herein its Supplement to its Amended and Supplemental Complaint heretofore filed herein, and thereafter and on September 19, 1940, Defendants filed their Answer to the Supplement to the Amended and Supplemental Complaint aforesaid.

(7) On October 18, 1940, after full hearing in the District Court of the United States of the said case of *Fieldcrest Dairies, Inc.* v. *City of Chicago,* No. 316, the Honorable Charles E. Woodward rendered a decision in said cause, a copy of which is attached hereto, marked Exhibit "A" and by this reference thereto, hereby made a part hereof.

(8) Thereafter, and on October 23, 1940, the Honorable Charles E. Woodward entered certain Findings of Fact and Conclusions of Law in said cause, and a Final Decree, true copies of which Findings of Fact, Conclusions of Law and Final Decree are attached hereto, marked Exhibits "B," "C" and "D," respectively, and by this reference thereto, hereby made a part hereof.

(9) Thereafter, Defendants, City of Chicago, et al., filed their notice of appeal from said Decree entered by the said Honorable Charles E. Woodward on October 23, 1940, and made application to stay the force and effect of said Decree pending said appeal, which application was denied.

(10) Thereafter, and on October 25, 1940, Defendants in said Federal Court cause filed a short record in the United States Circuit Court of Appeals for the Seventh Circuit, which was thereupon docketed as "*Fieldcrest Dairies, Inc., a corporation,* Plaintiff-Appellee v. *City of Chicago, a Municipal corporation, et al.,* Defendants-Appellants, No. 7402" in said court.

(11) Defendants, through their counsel, made application to the United States Circuit Court of Appeals for the Seventh Circuit, for the entry of an order granting supersedeas staying the force and effect of the Final Decree theretofore entered by the Honorable Charles E. Woodward, hereinabove fully described, and a copy of which is attached hereto marked Exhibit "D."

(12) Thereafter the application for supersedeas so made by said Defendants to the United States Circuit Court of Appeals was denied, leaving said Final Decree, Exhibit "D" hereto, in full force and effect.

(13) Petitioner further shows that, as hereinabove more fully set forth, it was represented to this Court that the disposition of said cause in the United States District Court would determine the issues presented in this cause and that said issues should not be re-tried herein, but should abide the determination of said issues in said Federal Court proceeding.

(14) Petitioner further represents that it is informed and believes and therefore states the fact to be that said appeal No. 7502 is still pending in the United States Circuit Court of Appeals and the determination thereof may be delayed for several months.

(15) Petitioner further represents that it is informed, believes and therefore states the fact to be that since

the entry of the decree, Exhibit "D" hereto, competitors of Petitioner have engaged in the sale of milk and milk products in paper bottles or single-service containers within the corporate limits of the City of Chicago without hindrance or molestation from the Defendants, or any of them. Petitioner seeks the right to use paper bottles or single-service containers, identical in all respects with those involved in and approved by said Federal District Court decree, whereas its competitors are using containers of a different type and make which have not been subjected to the same critical examination. Petitioner is thereby placed at a great disadvantage in the sale of its milk and milk products due to the failure and refusal of Defendants to issue or re-issue or restore to Petitioner the permits which are required under the ordinance of the City of Chicago as a prerequisite to engaging in the sale and distribution of milk and milk products within the corporate limits of the City of Chicago.

Petitioner therefore prays that an order be entered herein granting to Plaintiff the relief prayed for in its Amended and Supplemental Complaint as amended, heretofore filed herein, and that this Court retain jurisdiction of this controversy pending the final determination of said appeal No. 7502 now pending in the United States Circuit Court of Appeals, to the end that should said Decree from which said appeal is taken be affirmed, the order now to be entered herein shall become final, and should said Decree of the United States District Court be reversed or modified by the United States Circuit Court of Appeals in said case No. 7502, then that this cause shall stand for further hearing herein.

And your Petitioner will ever pray.

DEAN MILK COMPANY,
By CHAS. O. RUNDALL,
Its Attorneys.

CHAS. O. RUNDALL,
HORACE A. YOUNG,
Attorneys for Petitioner,
Dean Milk Company.

Attached to said petition as Exhibit "A" was the memorandum dated October 18, 1940, of Woodward, U. S. District Judge, and as Exhibits "B," "C," and "D," respectively, copies of the findings of fact, conclusions of law and decree of the United States District Court, per Woodward, District Judge, entered October 23, 1940, which are here omitted in printing because included in the Record (Vol. 3, pp. 1756-1761) of *City of Chicago, et al.*, Petitioner, v. *Fieldcrest Dairies, Inc.*, Respondent, October Term, 1941, No. 706.

On due notice, the Circuit Court of Cook County entered an order on December 3, 1940.

Text of Order of December 3, 1940.

This matter coming on to be heard upon the Amended and Supplemental Complaint of Plaintiff heretofore filed herein and the Answer of the Defendants filed thereto, and upon the Supplement to the Amended and Supplemental Complaint and the Answer of the Defendants thereto, and upon the Petition of the Defendants heretofore filed herein on June 25, 1940, praying that the above entitled cause

abate pending the disposition of a certain cause or proceeding then pending in the District Court of the United States for the Northern District of Illinois, Eastern Division, known as *Fieldcrest Dairies, Inc.*, Plaintiff v. *City of Chicago, et al.*, Defendants, No. 316, and upon the Petition of Plaintiff filed herein on November 29, 1940, upon notice to counsel for the Defendants and continued for hearing until this date, and the Court having examined said pleadings and Petitions and having heard arguments of counsel, and now being fully advised in the premises, Finds that the allegations of the Petition of Plaintiff filed herein on November 29, 1940, are true and that Defendants neither consent nor object to the entry of this order, but have agreed in open court that no interlocutory appeal shall be taken therefrom,

It Is Therefore, Ordered, Adjudged and Decreed as follows:

(1) That the Defendants and each of them, and their officers, attorneys, agents, inspectors, employees and all persons acting in privity with them, or any of them, be and they are hereby restrained and enjoined from—

(a) In any manner, or by any means, interfering with, obstructing or hindering the Plaintiff from the sale and distribution of its Grade A pasteurized milk or milk products in single-service containers or containers known as "Pure-Pak" containers, within the City of Chicago, provided that the sale and distribution of said milk and milk products otherwise conforms with the applicable ordinances of the City of Chicago and the statutes of the State of Illinois;

(b) Prosecuting Plaintiff, its officers, agents, employees and all persons acting in privity with them, or

any of them, in any action in law or in equity, or in any criminal action purporting or alleged to arise out of the so-called violation by Plaintiff of the ordinances or the Municipal Code of the City of Chicago regarding the sale of its Grade A pasteurized milk or milk products in single-service containers or containers known as "Pure-Pak" containers, within the City of Chicago, provided that the sale and distribution of said milk and milk products otherwise conforms with the applicable ordinances of the City of Chicago and the statutes of the State of Illinois;

(c) Arresting, molesting, annoying, injuring, harming or abusing Plaintiff or its officers, agents or servants in the sale and distribution of Plaintiff's Grade A pasteurized milk and milk products in single-service containers or "Pure-Pak" containers within the City of Chicago, provided that the sale and distribution of said milk and milk products otherwise conforms with the applicable ordinances of the City of Chicago and the statutes of the State of Illinois;

(d) Confiscating, damaging, injuring or destroying any or all of Plaintiff's Grade A pasteurized milk or milk products contained in single-service containers or "Pure-Pak" containers which at any time or times may be within the corporate confines of the City of Chicago, provided that the said milk and milk products otherwise conform with the applicable ordinances of the City of Chicago and the statutes of the State of Illinois.

(2) That Defendants, and each of them, be and they are hereby ordered and directed to rescind the action taken on August 30, 1940, in connection with the purported revoca-

tion of certain licenses heretofore issued to Plaintiff, and restore or re-issue to Plaintiff said permits, being milk plant permit No. 37 for its milk plant at Chemung, Illinois milk distributor permit No. 37 for premises located at 2511 West Lake Street, Melrose Park, Illinois, permits for five vehicles, Nos. 27 to 31, both inclusive, and to restore or re-issue to Plaintiff permit No. 8605 for a food purveyors and milk and milk products store located at 3819 Southport Avenue, Chicago, Illinois, provided, however, that said plant, premises, vehicles and store conform with the applicable ordinances of the City of Chicago, and provided further that the milk and milk products sought to be dealt with therein and therefrom may be sold and distributed in paper bottles or single-service containers known as "Pure-Pak" containers if the said milk and milk products otherwise conform with the applicable ordinances of the City of Chicago.

(3) That a writ of mandamus issue herein directing and compelling Defendants, and each of them, to issue or to re-issue and restore to Plaintiff a milk plant permit for its milk plant at Chemung, Illinois, a milk distributor's permit for premises located at 2511 West Lake Street, Melrose Park, Illinois, permits for five vehicles and a food distributor's permit for a store located at 3819 Southport Avenue, Chicago, Illinois, provided, however, that said plant, premises, vehicles and store conform with the applicable ordinances of the City of Chicago, and provided further that the milk and milk products sought to be dealt with therein and therefrom may be sold and distributed in paper bottles or single-service containers known as "Pure-Pak" containers if the said milk and milk products otherwise conform with the applicable ordinances of the City of Chicago.

(4) The provisions of this order shall be effective until the further order of this Court and pending the final disposition of the case of *Fieldcrest Dairies, Inc.*, Plaintiff v. *City of Chicago, et al.*, Defendants, No. 316 in the District Court of the United States for the Northern District of Illinois, Eastern Division, now pending on appeal as case No. 7502 in the Circuit Court of Appeals of the United States in and for the Seventh Circuit.

(5) For good cause shown, and the Court being of the opinion that the injunction herein ought to be granted without bond, it is further Ordered, Adjudged and Decreed that Plaintiff be not required to file any bond herein and that the filing of such bond be and the same is hereby excused.

No further proceedings have been had in the above case in the Circuit Court of Cook County, Illinois, and the time for an appeal from the order just set forth has expired.

D. JOINT CONCLUSIONS OF COUNSEL WITH RESPECT TO STATE COURT PROCEEDINGS.

Counsel for petitioners and for respondent in the Supreme Court of the United States agree:

1. That the state court proceedings have not decided any question of law or fact relevant to a decision by the Supreme Court of the United States of the pending cause entitled, *City of Chicago, et al.*, v. *Fieldcrest Dairies, Inc.*, October Term, 1941, No. 706;

2. That the plaintiff, Dean Milk Company, whose wholly-owned subsidiary is Fieldcrest Dairies, Inc., and the defendants, City of Chicago, *et al.*, (petitioners in the Supreme Court of the United States) each and all requested the Circuit Court of Cook County, Illinois, to stay the proceedings in said court pending the final disposition of the case of *Fieldcrest Dairies, Inc.*, v. *City of Chicago, et al.*, then pending in the District Court of the United States for the Northern District of Illinois, being

the case now pending on grant of certiorari by the Supreme Court of the United States.

Respectfully submitted,

CITY OF CHICAGO, *a Municipal Corporation,*
BOARD OF HEALTH OF THE CITY OF CHICAGO,

Conclusion and signatures	45

SUMMARY OF BRIEF.

STATEMENT. PAGE

The Circuit Court of Appeals based its decision on the sole ground that the 1939 Milk Pasteurization Plant Act of the State of Illinois (Illinois R. S., 1941, Chapter 56½, "Foods", pars. 115-134) withdrew from the City of Chicago the power to prohibit, as distinguished from regulate, types of milk containers approved by the State of Illinois. The opinion did not in any respect limit or disparage the power of the state legislature over the entire subject, but rather gave that power full recognition as being superior to the power of the City of Chicago, which is a creature of the state legislature. Emphatically, the Circuit Court of Appeals did not decide either that the ordinance was unreasonable or that it was unconstitutional and there is no occasion to consider those questions at this stage of the proceedings..... 1

ARGUMENT.

I. The court properly decided the question of Illinois law since cases like Railroad Commission of Texas v. Pullman Company, 312 U. S. 496, requiring the Federal court to stay its determination of state law pending action in the state courts are limited in their application to proceedings where the state has furnished a statutory appeal from the order being attacked in the Federal court. The courts below properly noticed the passage of the Illinois statute during the pendency of the suit and since an interpretation of the statute was necessary to a decision of the case, the Circuit Court of Appeals was bound to determine the question and did not err in so doing..... 7

PAGE

II. The court below correctly decided the question of Illinois law. The City of Chicago is a creature of the state, and its powers are strictly construed. Such powers may be withdrawn by implication. No city ordinance contrary to the statutes or public policy of the state, as enacted by the state legislature, may be enforced even though passed before the statute was enacted. The only effect of Section 19, the so-called "saving clause", was to prevent a repeal of all of the City's power by implication. It did not nullify express provisions of the statute nor give the City the power to prohibit what was permitted by statute and by lawful regulations pursuant to the statute. The state is superior to the city and not the city to the state. Under City of Rockford v. Hey, 366 Ill. 526, the City of Chicago has no power to prohibit the sale of milk in the City of Chicago from the plaintiff's plant in Chemung, McHenry County, Illinois, since the plant, equipment and method of operation have been approved by the director of the Department of Health of the State of Illinois pursuant to Illinois statute 10

III. The opinion of the Circuit Court of Appeals is in harmony with the decisions of this Court and since it was not based upon any constitutional determination or upon any determination of the reasonableness of the ordinance all of the petitioners' argument under Point II of their supporting brief is disregarded..... 44

Supreme Court of the United States

OCTOBER TERM, A. D. 1941.

No. 706

CITY OF CHICAGO, a Municipal Corporation, BOARD OF HEALTH OF THE CITY OF CHICAGO, DR. ROBERT A. BLACK, Health Commissioner and Acting President of Board of Health of The City of Chicago,

Petitioners,

vs.

FIELDCREST DAIRIES, INC.,

Respondent.

BRIEF IN OPPOSITION TO PETITION FOR WRIT OF CERTIORARI TO THE CIRCUIT COURT OF APPEALS FOR THE SEVENTH CIRCUIT.

STATEMENT.

MAY IT PLEASE THE COURT:

The District Court decided (35 Fed. Supp. 451; R. 1752) that plaintiff's Pure-Pak paper milk bottle was a "standard bottle", that if the ordinance were interpreted so as to prohibit it the ordinance would be unreasonable under the Illinois law, and that the passage during the pendency of the suit of the Illinois statute on pasteurization de-

prived the City of Chicago of the power to prohibit plaintiff's container because the sovereign state had approved it.

The Circuit Court of Appeals (122 F. 2d 132; R. 1782), held, one judge dissenting—giving assurance that the case had full consideration in the conference room—that the District Court was bound to notice the passage of the pasteurization statute *pendente lite* (in obedience to *Vandenbark* v. *Owens-Illinois Glass Co.*, 311 U .S. 538, 543), and that under the state-court decisions that statute took away from the City of Chicago the right to prohibit plaintiff's paper milk bottle. This was the only ground of the decision.

The court said:

> "Having thus concluded, we find no occasion to discuss at length or decide other controverted questions as to the validity of the ordinance."

The Circuit Court of Appeals also said that the language of the ordinance (Sec. 3094; R. 108) was to be interpreted as the aldermen meant it in 1935, and that "standard milk bottle" as then used did not permit plaintiff's container. This holding was perhaps due to our failure to cite in our brief *City of Chicago* v. *Alpert*, 368 Ill. 282, which contrary to the earlier case[1] cited by the C. C. A. held that legislative language is dynamic, not static.[2]

---

[1] *People* v. *Barnett*, 319 Ill. 403.

[2] *City of Chicago* v. *Ben Alpert, Inc.*, 368 Ill. 282, at p. 286:

> "The General Assembly, in the quoted delegation of power, ['to direct the location and regulate the use and construction of * * * garages * * * within the limits of a city or village'] did not define 'garages' thereby limiting the authority delegated by making the word 'garages' a static or dormant con-

In a studied effort to inject supposed questions of far-reaching public concern into a simple case, the defendants have filed a petition of 59 pages contending that the decision of the Circuit Court of Appeals on the question of local law is wrong, or at least is so doubtful that the court should have left the decision of the question hanging in the air until somehow a state court had decided the question, and that the ordinance is not unconstitutional, etc., etc.

Our answer is that the Circuit Court of Appeals decided the question of local law correctly and that unless this Court grants certiorari to review that decision, there is no occasion to consider constitutional questions which the City pretends to see in this case. Neither is there, at this stage of the proceedings, any occasion to pay ex-

---

cept rendering cities impotent to cope with the ever-changing conditions of a mobile and complex society. In short, cities and villages are not restricted, in directing the location and regulating the use and construction of garages, to such premises as may have conformed to the accepted popular definition of the word 'garage' in 1911, when it was incorporated in the statute. Conditions attending the storage and parking of automobiles in metropolitan areas today are vastly different from those prevailing a quarter of a century ago when the State empowered cities to regulate and license garages. It is common knowledge that in cities considerable areas are devoted to parking and storing motor vehicles. Casual observation will disclose that in some instances the premises are denominated parking lots and, in others, outdoor or open-air garages. We are not required to be insensible to this mode of transacting an important part of the automobile business. The express power to regulate the use and construction of garages is sufficiently comprehensive to authorize cities and villages to license open-air as well as closed public garages. A legitimate exercise of this power is immune from constitutional assault."

cessive tribute to the legislative branch, as the City does. The court below gave full effect to all of the rules which this Court has consistently adhered to. It properly decided that under Illinois law the legislative action of the state legislature was superior to that of the Chicago aldermen.

If the writ is allowed we shall of course wish to be heard on the question of Illinois law as to whether the ordinance is a reasonable one but since the Court of Appeals placed its decision on the other ground, we will stand in this answer on the ground stated in that court's opinion.

Despite defendants' protestation (Petition, pp. 37-38) that they are not asking this Court to reverse the judgment on the ground that the courts below should not have passed on the question of Illinois law (whether the Chicago ordinance was superseded by the Illinois Milk Plant Pasteurization act of 1939) defendants place great reliance on *Railroad Commisson of Texas* v. *Pullman Company*, 312 U. S. 496 (1941), which is wholly inapplicable unless the defendants contend that the Federal equity court should not have decided the question of Illinois law at all. That case held that where there is a readily available statutory method of reviewing a commission order, a three-judge Federal court ought not to enjoin operation of the order if that determination involved a doubtful question of state law.

Since the defendants, in spite of citing the *Pullman Co.* case, expressly disclaim any intention of asking for a postponement of the decision of the question of Illinois law until, perchance, it may be decided in some other case by a state court, the present argument of the defendants amounts to no more than this: that they think the decision by the Circuit Court of Appeals of the question of Illinois law was wrong. That is not the type of case

in which we understand certiorari is usually granted—not, at least, unless the decision is plainly wrong, which certainly the decision below was not. The court below was—we submit with all deference to this Court—in as good a position as is this Court to determine the question of Illinois law upon which the decision was based. The decision is of local interest only and does not present a question of such importance as justifies the awarding of the writ of certiorari. No conflict with Illinois decisions is shown, and in fact none exists.

If the court below misinterpreted the legislative will, the Illinois legislature can correct it. Twice the petitioners sound false alarms on that point. On pages 31-32, they say:

> "The effect of the opinion is that it is beyond the power of a state legislature to prescribe minimum standards to be observed throughout the state and at the same time to authorize municipalities to fix more stringent standards if they consider it necessary to do so."

And on page 35:

> "The boundary between the fields of state and local regulations may not be clearly defined. The decision of the Circuit Court of Appeals in effect takes away from the state legislature the power to fix the boundary and the court, in the exercise of its function to construe statutes, assumes the power itself."

In determining that the state legislature had, in fact and contrary to the defendants' contentions, withdrawn from the City of Chicago and taken back to the sovereign state the regulation of certain aspects of milk sanitation and control, the Circuit Court of Appeals emphatically did not disparage or cast any slightest doubt upon the power of the state legislature. The above quoted statements from petitioners' brief are not justified by any-

thing stated or decided in this case by the Circuit Court of Appeals and are wholly and entirely false.

In deciding the question presented, the Circuit Court of Appeals enforced the supreme power of the Illinois legislature over its reluctant and sometimes arrogant creature, the City of Chicago, and the false criticism now made of the court below is not actually based upon any refusal of the court to abide by the legislative will, but rather is grounded upon the proposition that the City of Chicago itself wishes to avoid the supremacy of state legislation which has thwarted the city's attempt to prevent the sale of milk in single-service containers, with all of their fitness for the prevention of disease and with their other benefits. Significantly, it is not the State of Illinois which is here complaining; it is only its creature, the City of Chicago. If the court below incorrectly read the legislative intention of the state legislature, the city is not without its remedy before that legislature. And in the meantime, no one is being harmed by the use of paper milk bottles. The City of Chicago has admitted this by permitting, since the date of the decision of this case by the District Court (October 18, 1940) the use in the city of millions of other paper containers without any regulation and without any proof of sanitation such as was made in the instant case, although these other containers are not of the type involved in this suit and are not protected by any injunction of any court, state or Federal. No harm has resulted from the use of such other containers without protection of any injunction, or from the distribution of milk in plaintiff's containers under protection of the present injunction, and the fact that the defendants have voluntarily permitted the use of these other containers is eloquent proof that the defendants well know that no public health hazard is involved in the use of paper containers.

ARGUMENT.

I.

The court below was correct in deciding the question of Illinois law.

The defendants submitted in the trial court and in the Circuit Court of Appeals the question whether the Milk Pasteurization Plant Act of 1939 (Illinois R. S. 1941, Chap. 56½, Paras. 115-134) withdrew from the City of Chicago the right to prohibit the use of plaintiff's paper milk bottles which pursuant to such statute have been approved by the appropriate health official of the State of Illinois. Grasping at straws they now make for the first time the contention that the courts below should not have decided the question at all, but in some manner should have remitted the parties to the state courts for a decision of that question, citing *Railroad Commission of Texas* v. *Pullman Company*, 312 U. S. 496. Great reliance is placed on this decision by the defendants, but they ought not to be heard now to say that the courts below should have postponed the decision of the very question which all parties below submitted to such courts for decision. Furthermore, the *Pullman Company* case is not authority in the present proceeding, because in that case the Texas statute provided for a statutory method of appeal from the order of the Railroad Commission. The Illinois statutes have no comparable provision with respect to statutory appeals either from the action of the Board of Health of the City of Chicago (which, incidentally, recommended in October, 1939, that plaintiff's containers be permitted

to be used, R. 1698-1699) or from the action of the City Council in passing or refusing to pass an ordinance.

The provision for appeal from an order of the Railroad Commission of Texas is set forth in the marginal note.[1] It was on account of this statute that this

[1] 18 Vernon's Annotated Revised Civil Statutes of Texas (1926), pp. 357-358, (Title 112, Chap. 11, Art. 6453) provides:

"Art. 6453. (6657) Appeal

"If any railroad company or other party at interest be dissatisfied with the decision of any rate, classification, rule, charge, order, act or regulation adopted by the Commission, such dissatisfied company or party may file a petition setting forth the particular cause or causes of objection to such decision, act, rate, rule, charge, classification, or order, or to either or all of them, in a court of competent jurisdiction in Travis County, Texas, against said Commission as defendant. Said action shall have precedence over all other causes on the docket of a different nature, and shall be tried and determined as other civil causes in said court. Either party to said action may appeal to the Appellate Court having jurisdiction of said cause; and said appeal shall be at once returnable to said Appellate Court at either of its terms; and said action so appealed shall have precedence in said Appellate Court of all causes of a different character therein pending; provided, that, if the court be in session at the time such right of action accrues, the suit may be filed during such term and stand ready for trial after ten days' notice. Provided further that no preliminary injunction shall be issued without notice to the opposite party and that no temporary restraining order shall be granted without notice to the opposite party unless it shall clearly appear from specific facts shown by affidavit or by the verified petition that immediate and irreparable injury, loss or damage will result to the applicant before notice can be served and a hearing had thereon. Every such temporary restraining order shall be endorsed with the date and hour of issuance.

Court held that a three-judge Federal Court sitting in equity ought not to have decided a doubtful question of Texas law concerning the validity of an order of the Railroad Commission, but should have required the parties to pursue the statutory method provided by Texas law. In no respect is the case comparable to the present one. In fact, we point to the language of Mr. Justice Frankfurter in the *Pullman Company* case as authority for the proposition that this Court ought not to substitute its judgment for that of the Circuit Court of Appeals on a matter of Illinois law. The Court said (p. 499):

"Had we or they no choice in the matter but to decide what is the law of the state, we should hesi-

---

shall be forthwith filed in the clerk's office and entered of record, shall define the injury and state why it is irreparably (irreparable) and why the order was granted without notice, and shall by its terms expire within such time after entry, not to exceed ten days, as the court or judge may fix, unless within the time so fixed the order is extended for a like period for good cause shown, and the reasons for such extension shall be entered of record. In case a temporary restraining order shall be granted without notice in the contingency specified, the matter of the issuance of a preliminary injunction shall be set down for a hearing at the earliest possible time and shall take precedence of all matters except older matters of the same character; and when the same comes up for hearing the party obtaining the temporary restraining order shall proceed with the application for a preliminary injunction, and if he does not do so the court shall dissolve the temporary restraining order. Upon two days' notice to the party obtaining such temporary restraining order the opposite party may appear and move the dissolution or modification of the order, and in that event the court or judge shall proceed to hear and determine the motion as expeditiously as the ends of justice may require."

tate long before rejecting their forecast of Texas law."

No argument is or can be made that the question of Illinois law submitted to the courts below was unnecessary to a decision of the case. The fact is that the courts below were required to notice the passage of the Illinois statute which occurred during the pendency of the suit. Plaintiff's complaint which the District Court had clear jurisdiction to entertain challenged the validity of the ordinance of the City of Chicago which was claimed by the City to prohibit the use of plaintiff's container. There was, therefore, no escape from deciding whether the state legislature had withdrawn from the City the power to enforce an ordinance outlawing what the sovereign state had legalized.

We submit that the City's contention made for the first time in this Court should not be entertained because it was not submitted to the court below and that if entertained the decision should be against the City's contention because the case relied on is in no respect analogous to the present situation.

II.

The court below correctly decided the question of Illinois law.

Whether or not the City of Chicago can by the provisions of an ordinance enacted in 1935, prohibit the use of a milk bottle which is approved of and permitted use throughout the state of Illinois by an act of the Legislature in July, 1939, is certainly not a Federal question. It is clearly a question of Illinois law.

No federal question was involved in the decision of the Circuit Court of Appeals when it decided:

(1) That the provisions of the 1935 ordinance of the City of Chicago which attempted to regulate the use of milk bottles was superseded by the Milk Pasteurization Plant Act of July 1, 1939, and was repugnant to the latter statute.

(2) That the construction of the ordinance contended for by the City of Chicago, if accepted, would allow the City to prohibit, by ordinance, the use of a milk bottle approved by the legislature and would permit it to enact and enforce ordinances contrary to the statutes of the state of Illinois and the public health policy of the state as enunciated and laid down by the state legislature.

(3) That the well established rule of law in Illinois expressed by an unbroken line of Supreme Court decisions is that no city or village can enforce or enact ordinances repugnant to state statutes and the public policy of the state.

The petitioners state (page 9) in their petition for a writ of certiorari, to review the decision of the Circuit Court of Appeals:

> "* * * nevertheless the majority opinion of the Circuit Court of Appeals sets forth a number of grounds for holding the ordinance unreasonable, indicating that the majority considered the ordinance unconstitutional (R. 1794)."

And further petitioners state on page 9:

> "There is here a question of the propriety of a judicial pronouncement that a city regulation is invalid under the fourteenth amendment * * *"

Under the heading "Reasons For Allowance of The Writ" (page 9) petitioners further state that the Circuit Court of Appeals has decided "an important question of local law in a way clearly in conflict with the local law."

Petitioners cannot create and present a Federal or a constitutional question to this Court for a decision when the sole ground of the decision below was clearly one of Illinois law regarding the effect of the state statute passed in 1939 on the ordinance enacted in 1935.

Petitioners really confess that no constitutional or Federal question is involved when they say (page 9):

> "It was not necessary for the Circuit Court of Appeals to decide this constitutional question since it held that the city had been deprived of the power to pass the ordinance."

We are therefore unable to find any rational basis for reference by petitioners (page 9) to the Fourteenth Amendment being involved.

Further, under "Specification of Errors" (page 16) petitioners make no reference to a constitutional or Federal question being involved in the decision of the Circuit Court of Appeals. The decision of the Circuit Court of Appeals states that:

> "The question for consideration is whether the ordinance now contravenes the public policy of the state of Illinois, and whether so or not, was the situation at the time of the institution of suit so altered as to make the prohibition contained in the ordinance unreasonable and void." (R. 1789.)

And further in its decision the court, having decided that the legislative act superseded the ordinance, said:

> "Having thus concluded we find no occasion to discuss at length or decide other controverted questions as to the validity of the ordinance." (R. 1794.)

It is thus very apparent that the court did not pass on any Federal question in its decision. It followed the well established law in Illinois and the rule in the decision of this Court in the case of *Vandenbark* v. *Owens*

Illinois Glass Co., 311 U. S. 538 (1941) with regard to the force of the state statute.

It is difficult to believe that the defendants are serious in contending that the rulings of the trial court and the Circuit Court of Appeals "have clouded the powers of Illinois municipalities" (p. 37). This statement is not reconcilable with the practice of the City of Chicago in voluntarily permitting other dairies, not protected by any injunction, to sell milk in paper containers of a type not involved in the present litigation. Millions of such containers have been used since October 18, 1940, the date on which the district judge handed down his decision. A refusal on the part of the City to permit the use of these unprotected paper containers would most certainly have resulted in a speedy determination in the state courts of the precise question now raised in its petition, because Federal court jurisdiction based on diversity of citizenship would have been lacking as to numerous local milk dealers.

Under the heading entitled "Reasons For Allowance of The Writ" (p. 9) petitioner cites *Koy* v. *City of Chicago*, 263 Ill. 122, (1914) and *City of Ottawa* v. *Brown*, 372 Ill. 468 (1939), to support its contention that the Circuit Court of Appeals erred in interpreting Illinois law applicable to the problem involved. These two cases clearly have no competency or force to support this contention. In the case of *Koy* v. *City of Chicago*, 263 Ill. 122, the Court merely determined the right of the city to prescribe conditions under which milk might be pasteurized and, specifically, that a provision of an ordinance requiring a recording apparatus to be installed on milk pasteurizers to record the temperature of the milk during the operation was not unreasonable and was therefore valid.

The case of *City of Ottawa* v. *Brown*, 372 Ill. 468

(1939), now relied on by petitioner, decided simply that the enactment of an ordinance by the City of Ottawa in 1916 brought that City within an exception to an Act of the General Assembly of Illinois regulating the transportation, sale and use of gasoline "except in cities or villages where regulatory ordinances on the subject are in full force and effect." The question there decided by the court was solely one of fact, namely, was the 1916 ordinance governing the sale of gasoline in the City of Ottawa of such a character as to bring it within the statutory exception? The opinion of the court is completely devoid of language which, by any stretch of the imagination, could be construed to bear on the issues of the case at bar or to be in conflict with the decision of the Circuit Court of Appeals in the instant cause.

On the other hand, the case of *City of Rockford* v. *Hey*, 366 Ill. 526 (1937), is a clear-cut expression by the Supreme Court of Illinois which clearly evidences that court's attitude in a case which is substantially the same in principle as the case at bar. It was held in that case that the City of Rockford had no power by ordinance to require the owners of ice-cream factories in the cities of Sterling and Dixon (who were licensed by the Department of Health of the State of Illinois) to have their factories inspected by Rockford inspectors as a condition precedent to the sale in Rockford of ice cream products manufactured in Sterling and Dixon.

In the instant case the City undertakes to go much further; it seeks not merely to inspect, license or regulate single-service containers (the use of which the sovereign state permits) but it would if allowed to do so absolutely prohibit the use of such containers. It is at once apparent that this prohibition is precluded by the *Hey* case. If the city's present contention were sus-

tained the ordinance would effectually operate outside of the limits of the City of Chicago by interfering with and rendering practically worthless a state license issued to milk distributors who have complied with statutory regulations which permit such distributors to do what the City of Chicago takes upon itself to tell them they may not do. Obviously the City of Chicago cannot thus do indirectly what the City of Rockford could not do directly.

Petitioner contends (p. 12) that one of the reasons for the application for certiorari is that "the dictum of the Circuit Court of Appeals that the ordinance is an unreasonable exercise of the police power conflict with a long line of decisions of this court." We respectfully reply that there is no such dictum in the opinion of the Circuit Court of Appeals. The object of the ordinance being protection of public health, this object was fully satisfied by the legislature enacting the Milk Plant Pasteurization Act on July 24, 1939, (Ill. Rev. Statutes, 1941, Chapter 56½, pars. 115-134), and thereby expressing the public health policy of the State of Illinois as it applied to containers for milk. The City, the creature of the state, is certainly not possessed of power to nullify this action of the parent body from whom all the City's powers are derived.

We turn to the Illinois statutes and decisions which furnish abundant support for the opinion below and clearly refute petitioners' argument.

First, the City of Chicago has no inherent power. It is a creature of the General Assembly. To prohibit the use of any article, it must be able to point to a state statute giving it the power to do so. Furthermore, it is a cardinal rule of law that grants of powers to municipalities are strictly construed. This is well established by a long line

of well-reasoned cases and has been the subject of frequent public criticism by the distinguished corporation counsel of Chicago, Mr. Barnet Hodes,[1] but continues to be the law of Illinois, (*Bullman* v. *City of Chicago*, 367 Ill. 217 [1937]).

The rule was well stated in *City of Chicago* v. *Murphy*, 313 Ill. 98, (1924) as follows (p. 101):

> "Cities may exercise only such powers as are expressly delegated to them by the legislature. The legislature is vested with all powers not taken from it by the State or Federal Constitution. Many of its powers may be delegated by it to the cities created by

---

[1] "Over and over, the Illinois Supreme Court has clung to the traditional view of all jurisdictions, and has declared: A city 'may exercise only such powers as are expressly delegated to it by the legislature and such as are necessarily implied from those expressly given'. And also: A city 'possesses no inherent power.' Time and again, cities have attempted, first by one device and then by another, to break through the barrier set up by these interpretations. But there has been little success in this direction."

"In applying the rule of strict construction whenever cities claim the right to exercise certain powers, the courts are following a well settled principle which, as much as anything else, hamstrings municipalities. This rule, as reiterated in *Arms* v. *City of Chicago*, [314 Ill. 316], a 1924 case, is:

> 'Statutes which grant powers to municipal corporations are strictly construed, and any fair or reasonable doubt of the existence of such powers is resolved against the municipality which claims the right to exercise them.'

From *Law and the Modern City*, (1937) Barnet Hodes, pp. 36, 38. (The author's preface states: "The author, of course, accepts full responsibility for the views expressed. They in no way express any official position of the law department of the City of Chicago.")

its act. Cities are creatures of the legislature and derive their existence therefrom. They have no inherent powers. All powers of cities are derived from acts of the legislature. The fact that the legislature has the power to enact a law does not confer that power upon city councils but the same must be by legislative act conferred."

If the City of Chicago ever had the power to prohibit the use of single service containers by the ordinance in question that power now no longer exists, because of the fact that its exercise would be repugnant to subsequently enacted legislation of the sovereign state.

Section 3094 of the Milk Ordinance of the City of Chicago, here involved, provides:

"Any milk or milk products sold in quantities of less than one gallon shall be delivered in standard milk bottles; provided, however, that nothing herein contained shall be construed to prohibit hotels, soda fountains, restaurants, and similar establishments from dispensing milk or milk products from sanitary dispensers approved by the board of health" (Rec. 108).

Contrast this provision with the state statute enacted during the pendency of this suit (Act of July 24, 1939, Ill. R. S. 1941, ch. 56½, Foods, pars. 115-134). Section 2 of this Act requires that any person operating a pasteurization plant who distributes or sells pasteurized milk for consumption *anywhere in the State of Illinois* shall make application to the State Department of Public Health for a certificate of approval.

Section 4 requires the Department to make an inspection of the plant and if the plant, equipment *and methods of operation* are found to comply with the provisions of the Act, to issue a certificate of approval.

Section 6 is as follows:

"Inspection and samples.] Any person, operating

a pasteurization plant or having made application for a Certificate of Approval for the operation of a pasteurization plant shall at any time allow the Department to inspect such plant and to take such samples as may be deemed necessary by said Department."

Section 8 provides:

"Products to be sold in original containers.] All pasteurized milk and milk products shall be placed in their final delivery containers in the plant in which they are pasteurized. It shall be unlawful for hotels, soda fountains, restaurants, grocery stores, milk depots, milk stations and similar establishments to sell or serve any pasteurized milk or milk product except in the original container in which it was placed at the point of pasteurization, provided that this requirement shall not apply to milk or milk products consumed on the premises which may be served from the original container or from a dispenser approved by the Department for such service. The sale or distribution of bulk, loose or dipped pasteurized milk or milk which has been heated within the purview of this Act is hereby prohibited."

Section 9 states:

"Sellers and distributors within act.] Any person selling, delivering or distributing milk or milk products in the State of Illinois who shall heat milk or milk products or subject milk or milk products to other treatment in an effort to make the milk or milk products safe for human consumption or to preserve its keeping qualities shall comply with the provisions of this Act."

The first paragraph of Section 15 is as follows:

"Any pasteurization plant coming under the provisions of this Act shall conform with all of the following items of construction, equipment, maintenance and operation *and in accordance with minimum requirements adopted by the Director* for interpretation and enforcement of this Act." (Italics ours.)

Following and as an integral part of this section are certain items, including the following:

"Item 10. All multi-use containers and equipment with which milk or milk products come in contact shall be constructed in such manner as to be easily cleaned and shall be kept in good repair. *Single service containers,* caps, gaskets and similar articles *shall be* manufactured and transported in a sanitary manner." (Italics ours.)

"Item 18. Bottling or packaging of milk and milk products shall be done at the place of pasteurization by approved mechanical equipment."

Pursuant to the power therein granted, the Director of the Illinois Department of Public Health has promulgated "minimum requirements" for interpretation and enforcement of this Act, providing, in part, as follows:

"Satisfactory compliance.—This item shall be deemed to have been satisfied if: * * *

(5) All *single-service containers,* caps, gaskets and similar articles are manufactured and handled in accordance with requirements of the Department.

(a) The buildings and rooms in which *single-service containers* and container caps and covers are manufactured, packed, stored, and handled shall be clean, well lighted and ventilated, and free from dust and flies, as prescribed in items 1, 2, 3, 4, 6, 7, 8 and 11.

(b) The average bacterial plate count of the stock from which *single-service containers* and container caps and covers are made shall not exceed 100 colonies per gram. No substance shall be present in finished single-service containers and container caps and covers which is toxic.

(c) All operations of the fabrication plant and during transportation of the manufactured articles shall be so conducted as to reduce to a minimum the possibility of contaminating the manufactured articles, as prescribed in items 13, 14 and 15.

* * * * * * *

(e) All *single-service containers* and container caps and covers shall be so treated as *to be as imper-*

vious to milk and milk products as practicable." (Italics ours.)

Section 16 of the state statute is in part as follows:

> "Denial or revocation of certificate—grounds—hearing.] The Department may either refuse to issue, or may refuse to renew, or may suspend, or may revoke any certificate of Approval because of the violation of any of the provisions of this Act or for any of the following causes:
>
> (a) Insanitary conditions of plant surroundings within the control of the plant management, insanitary methods of handling milk, milk products or *milk containers or equipment.*
>
> (b) Employment of careless, indifferent and inefficient personnel.
>
> (c) Violation of any of the provisions of this Act or of the minimum requirements for interpretation and enforcement of the Act.
>
> (d) Failure to display Certificate of Approval to the public at all times when such Certificate of Approval has been issued as provided in this Act.
>
> (e) Displaying to the public any Certificate of Approval which has been suspended or revoked or which has expired. * * *" (Italics ours.)

We shall refer below to the effect to be given to Section 19 of the Act, relied upon by the City as preserving its right to prohibit paper bottles which the state permits.

Another statute should be noticed, the statute (Ill. Rev. Stats., 1941, c. 111½, "Public Health", par. 22) establishing the State Board of Health, whose duties are now transferred to the Illinois Department of Health by Ill. R. S., 1941, c. 127, "State Government," par. 55. The Public Health Statute provides in part:

> "Sec. 2. The State Board of Health shall have the general supervision of the interests of the health and lives of the people of the state. * * *

> The Board shall have authority to make such rules and regulations * * * as they may from time to time deem necessary for the preservation and improvement of the public health, * * *.
>
> It shall be the duty of all local boards of health, health authorities and officers, * * * of the State or any * * * city * * * thereof to enforce the rules and regulations that may be adopted by the State Board of Health * * *".

It will be noticed that under the terms of the above Acts the State of Illinois, as it has the undoubted right to do, has taken unto itself the approval of not only the plant but also the equipment and methods of operation of every person (including the respondent) who pasteurizes milk for sale in the State of Illinois. It has also occupied the following fields of milk sanitation: It requires that the "bottling or packaging" of milk shall be done at the place of pasteurization; it requires that all pasteurized milk shall be placed in final delivery containers in the plant in which it is pasteurized; and it makes it unlawful for any person in the state to sell or serve any pasteurized milk except in the original container in which it was placed at the point of pasteurization.

It was recognized expressly, both by the statute and by the lawful requirements made pursuant to it, that single service containers as now known, when kept as provided in the requirements and when "so treated as to be as impervious to milk and milk products as practicable" *are entirely proper containers for the sale of pasteurized milk throughout the State of Illinois. There is not one phrase or word in the statute mentioning the words "standard milk bottles", but rather the entire statute is broad and uses the words "multi-use containers", "single-service containers", "container caps", "fabricating plant", and "covers";* and Section (A) of the provision, under "Minimum Requirements" expressly refers to buildings and

rooms in which single-service containers and container caps and covers are manufactured, packed, stored and handled, and requires that they shall be clean, well-lighted, ventilated, and free from dust and flies.

The decisions of the Illinois courts and in fact those throughout the land are uniform that a municipal ordinance which conflicts with any statute or public policy adopted by the state legislature is invalid. And in Illinois it is clear that the General Assembly may resume at any time the power previously delegated to a municipality, and this may be done by implication.

In *City of Chicago* v. *Jensen*, 331 Ill. 129 (1928), the defendant was convicted of operating a beauty parlor without a license, in violation of an ordinance of the City of Chicago. Prior to this conviction a state statute went into effect, providing for the regulation of beauty culture. On appeal, the judgment of conviction was reversed, the court pointing out that the ordinance was inconsistent with the after-enacted statute. In discussing prior decisions of the Supreme Court, and the rule of law to be drawn therefrom, the court said, at page 131:

> "This court held that while the legislature may delegate power to a municipality to grant a license for a particular occupation and exact a license fee therefor, it may at any time take away such power and the State may resume the exercise of the power; that the legislature may repeal or amend any of the provisions of the act for the incorporation of cities and villages at pleasure, and if the provisions of the statute are inconsistent with the powers conferred on the city, the statute will operate as a repeal or amendment of the powers so conferred upon the city; that a city, as a subordinate political authority, cannot interfere with the validity or force of a license issued by the State under a statute; that the statute controls the whole subject matter.
>
> "The statute repealed any power the city may have had to regulate and license beauty culture, the judg-

ment convicting appellant was erroneous, and it will be reversed."

In the case of *Northern Trust Co.* v. *Chicago Rys. Co.*, 318 Ill. 402 (1925), holding that the Public Utilities act of Illinois repealed by implication the power granted to cities and villages to regulate such matters as headlights on street cars, it was argued that since the ordinance requiring street cars to be equipped with brightly lighted headlights was passed prior to the enactment of the first Public Utilities act, the ordinance would not be abrogated until the Utilities Commission had taken some action inconsistent therewith. The court said (p. 412):

> "When the first Public Utilities act came into force, on January 1, 1914, the power of the city over the subject matter of that act ceased to exist, and it could not thereafter pass new ordinances or enforce existing ordinances with reference to matters within the exclusive jurisdiction of the Public Utilities Commission. The power to enforce proceeds from the present or existing power or authority to enact or to provide. A municipality cannot be said to possess the power to enforce an ordinance concerning a subject upon which it has lost the power to pass the ordinance. Any attempt to enforce in such a situation would be defeated by interposing the act withdrawing the municipality's power to enact".

And in the early case of *Wilkie* v. *City of Chicago*, 188 Ill. 444 (1900) a Chicago ordinance required persons desiring to work as plumbers to obtain a license and pay an annual license fee of $30.00. Shortly thereafter the legislature of Illinois passed an act providing that persons desiring to engage in the business of plumbing should be examined as to their qualifications by a board created for that purpose and that successful applicants should receive certificates. In a suit to restrain the enforcement of the ordinance on the two-fold ground that (1) the city was

without power to license the business of plumbing, and (2) even if it had such power, the ordinance was in conflict with the later statute, and hence invalid, the Supreme Court affirmed a decree restraining the enforcement of the ordinance.

After pointing out that the power of the city to license the occupation of plumbing was, at least, very doubtful, the court said, at pages 452-3:

> "While the legislature may delegate the power to municipalities to grant a license for a particular occupation and to exact a license fee, they may, at any time, take away such power or resume the exercise of it themselves. The legislature may repeal or amend any provision of the act for the incoproration of cities and villages at their pleasure, and if the provisions of the act of 1897 are inconsistent with the power claimed by the city, they will operate as a repeal or amendment of the charter to that extent. * * * By this law the legislature have prescribed the test which shall enable a person to engage in the business of plumbing, and the city, by its proviso, has prescribed another and additional test. The legislature, by the law, say he is authorized to work at his trade throughout the State if he has the required certificate. The city of Chicago, by the proviso to the ordinance passed in pursuance of that law, says that he shall not work at his trade in that city except by paying $30 additional and receiving another license. The city, as a subordinate political authority, cannot interfere with the validity or force of the license issued by its board under the law. That these provisions are inconsistent is plain."

All the texts on the subject of municipal legislation announce the same rule. In 2 McQuillin on Municipal Corporations, 572 (2d ed.—1928), cited in opinion of the Circuit Court of Appeals, (Rec. 1791), the learned author states the principle that ordinances must harmonize with the public policy and common law of the State, in the following language:

> "*A Municipal corporation cannot, without special*

> *authority, prohibit what the policy of a general statute permits.* Nor, on the other hand, can an ordinance permit that which the State's policy forbids. Consequently under a general grant of power, a municipal corporation cannot adopt ordinances 'which infringe the spirit, or are repugnant to the policy, of the state as declared in its legislation.' It thus follows that if the state has expressed through legislation a public policy with reference to a subject, a municipality cannot ordain in respect to that subject to an effect contrary to, or in qualification of the public policy so established. * * *" (Italics ours.)

And in 43 Corpus Juris, 215-217, "Municipal Corporations," the rule regarding the invalidity of an ordinance which is inconsistent with the policy of the State as expressed by statute is thus stated:

> "Since a municipal corporation is a creature of the state, continuing its existence under the sovereign will and pleasure of the state, possessing such powers and such only as the state confers upon it, subject to addition or diminution of power at the state's supreme discretion, municipal regulations *must not directly or indirectly contravene the general law, nor can such regulations be repugnant to the policy of the state as declared in general legislation.*" (Italics ours.)

The Illinois cases are uniformly to the same effect.

In *City of Chicago* v. *Union Ice Cream Mfg. Co.*, 252 Ill. 311 (1911) the Supreme Court passed upon the validity of Section 1160 of the Municipal Code of Chicago which then provided for a penalty of not less than $5.00 nor more than $100.00 fine for any person who sold or offered for sale any impure or adulterated food. A statute, the Pure Food Act of July 1, 1907, enacted two years after Section 1160 of the Municipal Code was passed, provided for a greater penalty. In sustaining the ordinance as valid the court at page 313 said:

> "The laws of the state operate within the limits of

municipal corporations the same as elsewhere, unless otherwise clearly provided by municipal charters or statute. *Local laws and regulations are at all times subject to the paramount authority of the legislature.*" (Italics ours.)

In the last paragraph of this decision the Supreme Court used the following language which is indeed applicable to the ordinance here, saying at page 315:

> "Municipal authorities cannot, under a general grant of power, such as article 5 of the City and Village Act, adopt ordinances which infringe the spirit of a State law or are repugnant to the policy of the State as declared by general legislation, but the police regulations of a municipality may differ from those of the State upon the same subject, if they are not inconsistent therewith. (*McPherson* v. *Village of Chebanse*, 114 Ill. 46.) *This ordinance does not prohibit what the statute permits.* While the ordinance attaches a less penalty for its violation than does the statute, we find no repugnancy between them. The general policy under both is the same." (Italics ours.)

The pertinent language in this decision is "this ordinance does not prohibit what the statute permits." Obviously this is the test to be applied when an ordinance and state statute are to be construed.

Again, in the case of *City of Marengo* v. *Rowland*, 263 Ill. 531 (1914) the court held an ordinance of the City of Marengo requiring the closing of barber shops on Sunday invalid and again stated on page 534:

> "Municipal authorities under general grant of power cannot adopt ordinances *which infringe the spirit of a State law, or are repugnant to the general policy of the State* (*City of Chicago* v. *Ice Cream Co.*, 252 Ill. 311; 25 Amer. & Eng. Ann. cases, 675, note; *City of Clinton* v. *Wilson, supra.*) The public policy of the State is found in its constitution and statutes, and, when they are silent, in its judicial decisions and the constant practice of its public officials." (Italics ours.)

We submit, that if, as the court said in these decisions, a city cannot *adopt* such an ordinance, then *it certainly cannot by any process of reasoning enforce one that prohibits a right given by statute.* Since the legislature has clearly expressed the public policy of the state on health and the use of single-service milk containers such public policy is not to be shackled by ordinances or regulations of a city repugnant to it.

To prohibit the use of single-service containers would result in nullifying a provision of the statute, which is the paramount regulation. Legislatures are not subservient to municipalities in their expression of public policy but the municipality is subservient to the legislature.

This rule has been applied in a number of Illinois cases, some of which are cited in the opinion of the Circuit Court of Appeals. *Village of Atwood* v. *Cincinnati, etc. R. Co.*, 316 Ill. 425 (1925); *City of Marengo* v. *Rowland*, 263 Ill. 531, 534 (1914); *City of Chicago* v. *Union Ice Cream Mfg. Co.*, 252 Ill. 311, 315 (1911); *City of Chicago* v. *Drogasawacz*, 256 Ill. 34, 37 (1912).

In *Kizer* v. *City of Mattoon*, 332 Ill. 545, (1928) the validity of an ordinance regulating the storage of inflammable liquids, enacted after July 1, 1919, was involved. On July 1, 1919, an Illinois statute became effective:

> "Except in cities and villages where regulatory ordinances upon the subject are in full force and effect the Department of Trade and Commerce shall have power to make and adopt reasonable rules and regulations," etc.

The court said (p. 549):

> "Police regulations enacted by a city under a general grant of power may differ from those of the State upon the same subject, *provided they are not inconsistent therewith.*" (Italics ours.)

It also said (p. 549-550):

"The power to pass ordinances such as the one here in question was delegated to cities by the State through its legislature. Where the State delegates such power to a municipality it may resume it through legislative action and thus deprive the municipality of the right to exercise it. (*City of Chicago* v. *Phoenix Ins. Co.*, 126 Ill. 276; *Wilkie* v. *City of Chicago*, 188 *id.* 444.) Prior to July 1, 1919, the exclusive power of regulation here involved was lodged in cities and villages by virtue of clause 65 above quoted. By its act to regulate the storage, transportation, sale and use of gasoline and other volatile oils, in force July 1, 1919, the State withdrew from municipalities this exclusive power of regulation and gave to the Department of Trade and Commerce exclusive power to make and adopt reasonable rules and regulations governing the keeping, storage, transportation, sale or use of gasoline and volatile oils, except in cities or villages where regulatory ordinances upon the subject were in full force and effect. * * * The City of Mattoon on July 1, 1919, not having in full force and effect regulatory ordinances on the subject, its delegated power to enact such ordinances was automatically withdrawn by the State and the exclusive power to make such regulations for the city of Mattoon became vested in the Department of Trade and Commerce. The city of Mattoon having been divested of this power by the State, could not by its own action reacquire such power, but could only regain it by subsequent action on the part of the legislature."

A year later, in construing Section 38 of the Illinois Prohibition Act and an ordinance enacted by the City of Litchfield which prohibited the manufacture and sale of intoxicating liquor, the Supreme Court of Illinois in *City of Litchfield* v. *Thorworth*, 337 Ill. 469 (1929) pointed out that the city was bound by the definition of intoxicating liquor contained in the statute and had no authority to prohibit the sale of liquor not prohibited by the statute. At page 475 the court said:

"Section 2 of the Prohibition act defines the phrase

> 'intoxicating liquor.' It is the sale of liquor of the kind specified in the statute that is prohibited. The statute confers authority on municipal corporations to prohibit by ordinance the sale of the kind of liquor prohibited by the statute. The municipality is bound by the definition contained in the statute and cannot prohibit the sale of liquor not prohibited by the statute."

It is clear beyond peradventure from the foregoing cases, that the opinion below is correct on the matter of local law, that the City of Chicago has no inherent power, that its power to regulate milk comes from the State, that the State has the right to take the city's power away before or after the enactment of the city's ordinances, that the ordinance must not be in conflict with the provisions or public policy of the State statutes, and that the city has no right to prohibit what the State statutes or valid rules and regulations adopted pursuant thereto permit.

It will be well to bear in mind those general rules in considering the "saving clause" which the City relies on, namely Section 19 of the Act. Before passing to a discussion of that question, we wish to call the Court's attention again to the limitation on the power of the city imposed by *City of Rockford* v. *Hey*, 366 Ill. 526 (1937). In that case it was held that the City of Rockford had no power (under the same sections of the statute that the City of Chicago is relying on in the present case) to require the owners of ice cream factories in Sterling, Illinois and Dixon, Illinois, to have their factories inspected by Rockford inspectors as a condition precedent to the sale in Rockford of ice cream products manufactured in such factories. The Court said (p. 530):

> "In Illinois, a city organized under the Cities and Villages act has such powers, only, as are therein

expressly delegated by the General Assembly or necessarily implied to render the grant of specific powers effective."

and at p. 531:

"Legislative powers of municipal corporations are strictly construed, and any rational doubt as to the existence of power must be resolved against the municipality."

The Court then stated the issue (pp. 533-534):

"In short, the issue is whether plaintiff, the City of Rockford, may require ice cream factories, located in other cities, to meet sanitary requirements prescribed by the former city in order to entitle them to Rockford licenses upon payment of the annual fee for inspection of their plants.

"Municipalities have no extra-territorial jurisdiction except insofar as it is expressly or impliedly delegated by statute. (55 A. L. R. 1183; *City of Chicago* v. *Brent*, 356 Ill. 40; *Strauss* v. *Town of Pontiac*, 40 *id.* 301.) An inherent or implied limitation upon the city in the exercise of the powers delegated to it by the legislature is that such powers shall be exercised within the corporate boundaries of the municipalities."

"The legislature has not delegated power to municipal corporations to pass a regulatory and license ordinance which assumes to regulate ice cream factories outside their corporate limits. The provisions which plaintiff admits extend to ice cream factories in other cities are so inseparably connected with the other provisions applicable locally as to render the entire enactment void."

It is clear under this case that jurisdiction of the plaintiff's plant at Chemung, McHenry County, Illinois, is exclusively within the jurisdiction of the Department of Health of the State of Illinois and that the State statute relating to pasteurized milk which provides, in part, that all pasteurized milk shall be placed in its final delivery

containers at the plant, that bottling or packaging of milk shall be done at the place of pasteurization by approved mechanical equipment, and that it shall be unlawful for any person to sell or serve any pasteurized milk except in the original container in which it was placed at the point of pasteurization, contemplates the approval by the State Department of Health of plaintiff's operations without requiring approval by the defendant city.

It is important to notice this geographical division of authority between the State of Illinois and the City of Chicago, because the sole reliance of the City of Chicago for its power is on cases like *Koy* v. *City of Chicago*, 263 Ill. 122, and *City of Chicago* v. *Union Ice Cream Mfg. Co.*, 252 Ill. 311, where the pasteurizing or manufacturing plants were located within the confines of the City of Chicago.

The contention of the defendant here, as in the Circuit Court of Appeals, that its right to prohibit single-service containers is preserved by Section 19 of the Milk Plant Pasteurization Act of 1939 (the so-called "saving clause") is untenable. That section provides (Ill. Rev. Stat., 1941, Chapter 56½, Paragraph 133):

> "Nothing in this act shall impair or abridge the power of any city, village or incorporated town to regulate the handling, processing, labeling, sale or distribution of pasteurized milk, and pasteurized milk products, provided such regulation [does] not permit any person to violate any of the provisions of this act."

The word "does" is not a part of the act as passed, but may fairly be implied.

The proviso that "such regulation not permit any person to violate any of the provisions of this act" is simply a codification of the rule of municipal law in Illinois to

the effect that a city ordinance, even though passed under a power granted by the state, is at all times subject and subordinate to the state statutes or other regulations on the same subject promulgated by the state. The proviso does not expressly or impliedly give the City any power to prohibit what the State, by statute and regulations pursuant to statute, has expressly permitted.

The statute cannot be construed to mean (and we do not understand the defendants to so contend) that specific matters shall be subject to determination by both the state and by the city at one and the same time. That would mean chaos, a result not to be imputed to the legislature and a construction to be avoided if at all possible. In *Village of Atwood* v. *Cincinnati, Indianapolis and W. R. Co.*, 316 Ill. 425 (1925), that precise question was before the Supreme Court of Illinois, the issue being whether the Public Utilities Act of Illinois repealed by implication the power long before granted to municipalities to require watchmen at railway crossings. The court recognized the rule (pp. 432-433) that "the police power is an attribute of sovereignty and is primarily vested in the General Assembly, which has the right at any time to recall it from the agency to which delegated, and after being recalled to retain it or to confer it upon some other agency or government" and after finding (p. 430) that the Public Utilities Act gave the commission the power to require railroads to station flagmen at grade crossings, the court held (p. 431):

> "If both the commission and the village authorities can exercise the power, their requirements with reference to the same crossing may be utterly contradictory, for the village board may direct the stationing of a flagman while the commission may order a separation of grades. Obviously, in such cases both cannot be obeyed, and concurrent authority often leads

> to conflict and results in confusion. The Public Utilities act enjoins obedience to the commission's orders. That act is the later one and covers the whole subject of promoting the safety of the public at the intersections of streets and railroads. It is complete in itself and evidently was intended by the General Assembly to supersede the power conferred by subsection 27 of Section 1 of article 5 of the general Cities and Villages act to require railroad companies to keep flagmen at street crossings."

The court held that the Public Utilities Act and the power of the village were so clearly inconsistent that both could not stand and that therefore the power of the village was withdrawn and transferred to the Commerce Commission.

It is true that the question in that case was whether there was a repeal by implication of the powers granted to municipalities but what the court said about the conflict of concurrent jurisdiction and about the desirability of avoiding such conflict is very appropriate to the case at bar. We have conceded that that case did not turn on the construction of a saving clause. We further conceded that except to the extent that the State by and pursuant to the 1939 milk act occupies the field of milk regulation, the powers of the City of Chicago are unimpaired.

In *Northern Trust Co.* v. *Chicago Rys. Co.*, 318 Ill. 402, (1925) already referred to, where the question was whether the City of Chicago retained its power to require street cars to maintain brightly lighted headlights, the court said (p. 410):

> "Did the Public Utilities act of 1913, which conferred this ample control and supervision over public utilities, including street railroads, deprive municipalities organized under the general Cities and Villages act of the power to pass ordinances requiring street railroads to equip their cars with brightly lighted headlights? If both the commission and the city

> could exercise the same power at the same time with reference to the same subject matter their requirements in respect of the same utility might be utterly contradictory. In such cases the utility could not obey both the commission and the city council. Yet the Public Utilities act enjoined obedience to the commission's orders and prescribed severe penalties for failures to comply. Obviously, concurrent authority would lead to conflict and confusion."

There, again, the question was whether the conflict between the Cities and Villages Act and the Public Utilities Act was so complete as to indicate that the latter had repealed the former, but the reasoning of the court supports our contention that where the legislature has withdrawn a portion of the city's power and conferred it on a new agency (in our case, the Director of the Department of Health of the State of Illinois) at least to the extent of any conflict between the state and municipal authorities the state is dominant.

The doctrine of municipal law upon which we rely is well stated by the distinguished corporation counsel of the City of Chicago in Law and the Modern City (Barnett Hodes, 1937, p. 44) as follows:

> "We have seen, up to this point, how two salient principles are invoked to restrict cities—the principle of express authority from the state, and the canon of strict construction against the city. Suppose a city, in its effort to control its own destiny sails by those two shoals. Is it then safe in the sea of state control? Hardly. Ahead is a new reef.
>
> "The new peril is the principle that if the state sees fit to exercise power in its own name over an activity, the city is at once thrust out of the picture. This is the case even where the city has had jurisdiction for generations and its right to exercise the power has been heretofore firmly established. Application of this principle in Illinois has resulted in

> a gradual whittling away of many powers of cities, ranging in importance from control of beauty shops to regulation of transportation lines and other utilities."

With these authorities in mind, it seems clear that the only effect to be given to Section 19 is, first, that it prevents a repeal by implication of all power of municipalities to regulate milk, and, second, that the power of such municipalities continues unimpaired as to the numerous matters not referred to in the statute or in the minimum requirements promulgated pursuant thereto. It, however, gives municipalities no right to enact or enforce ordinances in conflict with the statute or the regulations adopted thereunder. The majority opinion below (Rec. 1792) adopted and succinctly stated this view thus:

> "It therefore appears reasonable that the sole purpose of the saving clause was to prevent a construction by implication withdrawing the vast authority which the city had theretofore had over the milk industry."

The awkward result of a different construction of Section 19 was then pointed out thus (Rec. 1793):

> "The defendants' contention, if sustained, would give the City a broader power than that provided by the Legislature for the state. It would make the state subservient to the city. It would impute to the legislature the purpose of withdrawing the power exercised by the city and by the saving clause reconferring such power. We are unable to believe that such an incongruous result was intended."

The present contention of the defendants that it was never intended by the state legislature that the Milk Pasteurization Plant Act of 1939 should be applicable at all to Chicago was not made in either court below. The de-

fendants' present argument (Petition, p. 27) that the state statute was intended to apply only to those municipalities which were so small that their officers were unable to adopt and enforce adequate regulations of the milk industry is made for the first time in this Court. This intention is said by petitioners to be "clear" (Petition, p. 27). Nothing appears in the Act to support this unusual and unreasonable interpretation. We reply that if the construction of the saving clause contended for by the defendants be adopted, then it follows as a logical inference that the Act is confined in its operation solely to such remote and sparsely inhabited communities. This incongruous construction of the statute would have the effect of rendering that statute inoperative and ineffective throughout the largest and most important part of Illinois. Such a result is certainly to be avoided unless the language of the Act does not permit any alternative. Not one word or syllable appears in the Act which even suggests that the legislature intended the Act to be limited in its territorial application. And if the legislature had so intended it would certainly have expressed that intention in words by a saving clause similar to that in *City of Ottawa* v. *Brown*, 372 Ill. 468 (1939), where such a legislative intention existed and was clearly expressed. This supposed intention of the legislature is merely conjectural and gets not the slightest support from any words in the Act.

The statement by petitioners (Petition, pp. 28-29) that the majority opinion of the Circuit Court of Appeals disregards the plain language of the statute in holding that the City's power is less than it was before the statute was passed, is sustainable only by adopting the view of the defendants (advanced for the first time in this Court) that the July 24, 1939, statute is applicable only to rural

areas and other small communities and not to Chicago, and, as just stated, that contention is not supported by any language in the statute.

Defendants' statement (Petition, p. 31) that the effect of the opinion of the court below is to hold that it is *beyond the power* of a state legislature to prescribe minimum standards throughout the state and at the same time authorize municipalities to fix more stringent standards is a strange perversion of the language of the opinion, which expressly stated "that the city, by virtue of the saving clause, has the power to regulate paper containers * * * but we are unable to accept the theory that it has authority to outlaw that which the state has legalized." Furthermore, the question is not whether it is or is not beyond the *power* of the state to prescribe minimum standards and to authorize municipalities to fix more stringent standards (a power which undoubtedly exists and which we do not question) but *whether the legislature has manifested an intention in the statute under discussion to permit municipalities to fix standards which forbid what the statute permits.* In other words, does the Act manifest an intention by the legislature that it shall become operative in a given municipality, in whole or in part, subject to the approval of, or acceptance by, such municipality, of its provisions? It is only by adopting the view that the Act was intended to have a limited territorial operation that the criticism of this aspect of the opinion becomes understandable. But, as we have above indicated, such an interpretation is impossible.

The further statement of the petitioners (Petition, p. 31) that the Circuit Court of Appeals "disregarded" the language of the saving clause on the ground that if the saving clause was given effect "it would make the

state subservient to the city" finds no support in the language of the opinion. What the court did say was that "*the defendants' contention*, if sustained, would give the city a broader power than that provided by the Legislature for the state. It would make the state subservient to the city." The propriety of this view of the Court is at once apparent when it is realized that *defendants' contention* is that the statute in question was intended by the Legislature to have but a limited territorial application to become effective subject to the approval of the City of Chicago and such other municipalities as might enact ordinances on the same subject. Since there is nothing in the language of the statute to sustain such an interpretation, we submit that the petitioners in stating that the Circuit Court of Appeals "disregarded" the language of the saving clause have taken the same liberty with the language of the opinion as they do with the language of the statute.

The further statement by the petitioners in attempted justification of their criticism of the opinion (Petition, p. 32) that "the state is not subservient to the city if the state permits what the city forbids; each is merely regulating in its own sphere to meet its own particular needs" can be described only as astonishing. The contention is made in even bolder form in the following language (Petition, p. 32) "there is no rule of law that * * * the municipality may not forbid what the state permits." Such statements may be accurate expressions of the rule applicable in states which have adopted "home-rule"; they are in violent conflict with the law in Illinois. The reluctant admission (Petition, p. 32) that there is a rule that where a statute and ordinance conflict, or when an ordinance is contrary to a public policy, the statute

controls, is modified by the statement that such rule applies only when the contrary intention of the Legislature does not appear in the language of the statute. That intention does not appear in the present statute. The *assumption* by the defendants that the statute was intended to have a limited territorial application and that it was to be operative only in those cities and villages which were unable or unwilling to regulate the matters therein specified does not appear in the language of the statute, and there is, therefore, no necessity to discuss the exception to the rule. The rule itself applies: the inconsistent ordinance must yield to the statute.

The Circuit Court opinion gave full effect to the object of Section 19, the "saving clause", in holding that its only effect was to prevent a repeal by implication of the City's entire power to regulate the sale of pasteurized milk. The so-called "saving clause" simply indicated that the statute should supersede the power of the municipality *only to the extent that the state had entered the field of milk regulation.*

As part of the record in the present case there has been printed (R. 23-112) the milk ordinance of the City of Chicago passed January 4, 1935, the rules and regulations of the Chicago Board of Health, and certain resolutions by the Board of Health.* A comparison of the provisions of

---

* Exhibit A attached to the complaint indicated by typographical differences what part of the exhibit was the ordinance, what part was rules and regulations and what part constituted the so-called public health reasons. These are all printed in the record in one style of type so that it is difficult to determine where the ordinance leaves off and the rules and regulations of the Board of Health begin. It is also difficult to find where each section of the

the ordinance, and particularly the rules and regulations of the Board of Health, with the 1939 Milk Act passed by the legislature, will indicate to what greater extent than the state statute the Chicago city ordinance goes. It provides for licenses both of sellers and their vehicles (R. 33, R. 34), for the display of the license emblem on each vehicle (R. 36), for the revocation of the license (R. 37), for the labeling and placarding of all bottles, cans, packages, and other containers enclosing milk or any milk product (R. 37), for the inspection of dairy farms (R. 39), for the examination of samples (R. 40), and the permissible "plate counts" for bacteria (R. 44), none of

---

ordinance begins and we therefore supply the following table:

	Chicago Milk Ordinance.	Record Page
Sec. 3082	Definitions	26
Sec. 3083	Sale of aduiterated milk prohibited	32
Sec. 3084	Permit to sell, etc.	33
Sec. 3085	License required for sale of milk or milk products	34
Sec. 3086	Application—Separate license for each place of business—change of location	34
Sec. 3087	License fees	35
Sec. 3088	Vehicles to display license emblem on windshield	36
Sec. 3089	Revocation of license	37
Sec. 3090	Labeling and placarding	37
Sec. 3091	Inspection of dairy farms and milk plants, report to be posted	39
Sec. 3092	Examination of samples	40
Sec. 3093	Kinds of milk—requirements	45
Sec. 3094	Dipping—delivery containers—delivery at quarantined places	108
Sec. 3095	Products shipped from beyond limits	110
Sec. 3096	Notification of disease	110
Sec. 3097	Suspicion of infection—procedure	111
Sec. 3098	Limit of time of sale	111
Sec. 3099	Penalty	111

which subjects is covered by the state statute. It is obvious that the object of Section 19 was to preserve to the City the right to continue the ordinances and regulations on those subjects not occupied by the state system of supervision.

The next, and, we think, determinative question, is whether, in fact, the state of Illinois has occupied the field of approving types of containers so that any action of the City of Chicago in conflict therewith is void.

We submit that the state has, under the terms of the Milk Act of 1939, given its approval to paper containers (termed in the Act single-service containers, but at the present time the only single-service containers in commercial use are paper). As has been seen, Section 4 of the state statute provides for the issuance of a certificate of approval to a pasteurization plant after an inspection "if the plant, equipment and methods of operation" are found to comply with the provisions of the Act. The plaintiff's plant at Chemung, McHenry County, Illinois, is equipped only for the bottling of milk in Pure-Pak paper containers on machines leased from the Ex-Cell-O Corporation, and the plaintiff does not have facilities to bottle milk in glass containers (R. 890).

An integral part of its "method of operation", approved by the State of Illinois (R. 695-696) is the packaging of milk in these containers. That the method of packaging milk is just as much a part of the method of operation which the Director of the Department of Health of the State of Illinois approved, is clearly indicated by the requirements of Section 8 that all pasteurized milk shall be placed in final delivery containers in the plant in which pasteurized and by the provision of Section 15, Item 18, that "bottling or packaging of milk and milk products shall be done at the place of pasteurization by approved me-

chanical equipment." This, of course, means "Approved by the Director of the Department of Health of the State of Illinois."

The Ex-Cell-O Pure-Pak machine, pictures of which are rather poorly reproduced in the printed record (R. 1469, R. 1498-1501), is **equipment** adapted solely to the packaging of milk in Pure-Pak paper bottles by means of a mechanical operation whereby that part of the paper bottle coming in contact with the milk is not touched by human hands at the dairy and before being filled with milk is immersed in a hot paraffin bath, then cooled in the refrigeration unit, and automatically filled, sealed and stapled.

Section 16 (a) of the state statute gives the Department the right to suspend its certificate of approval because of unsanitary conditions of "**milk containers or equipment**". This clearly shows supervision by the State of Illinois of the pasteurization plant, the method of doing business, the equipment, and milk containers, and is an occupation of that field, at least with respect to the approval of the type of container, to the exclusion of the City.

We have shown above repeated references in the statute, and the state rules and regulations promulgated pursuant to it, recognizing paper containers, and in view of the approval by the State of Illinois, pursuant to the state statute, of both the pasteurization plant and the method of operation, namely the use of paper containers instead of glass containers, we insist that the State of Illinois has withdrawn from the City of Chicago the right to prohibit (as distinguished from regulate) paper bottles. On one hand the state approves the pasteurization plant and the type of container and makes it illegal to sell milk in any way except in that container and on the other hand

the City of Chicago steps in and says you may not sell in that type of container. The city is not attempting to *regulate* the container approved by the state, but to *prohibit* it, and the decisive question is whether a creature of the state, such as the City of Chicago, may challenge the approval by the parent state made pursuant to state law, of a method of operation recognized by, although not required by, the statute. We think, under the cases already cited under this heading, the answer is obvious.

Those cases hold clearly that in instances of conflict between state authority and municipal authority, the latter must give way, and we can think of no sharper conflict than the present instance in which the state approves and the city attempts to forbid.

We may ask whether in this particular case an application of this rule will lead to justice or injustice. We submit that it will lead to justice. In this case we have the City of Chicago aligning the *supposed* judgment of fifty aldermen rendered in the year 1935, at a time when these containers were not widely known, against a majority of the Board of Health of the City of Chicago acting in 1939, the General Assembly of the State of Illinois, (which recognized single-service containers as proper in the 1939 Act), the Director of the Department of Health of the State of Illinois, (who has approved the plaintiff's plant and its method of operation), the United States Public Health Service (which has amended its model ordinance expressly to permit single-service containers), and the practical experience of hundreds of other municipalities.

III.

The opinion of the Circuit Court of Appeals is in harmony with the decisions of this Court.

Petitioner also contends that the Circuit Court of Appeals' opinion is contrary to decisions of this Court. This is an inaccurate statement for this Court in *Erie Railway Co.* v. *Tompkins*, 304 U. S. 64, and *Thompson* v. *Magnolia Petroleum Co.*, 309 U. S. 478, stated that the Circuit Court of Appeals and Districts Courts were in duty bound to follow the law of the state courts and that there was no "general law". In construing the ordinance and statute in question here, the Circuit Court of Appeals, as abundantly shown under Point II above, followed the state law on the subject. Under the rule announced by this Court in the cases mentioned above, it ought not to have done otherwise. The Circuit Court of Appeals *did not* decide any constitutional question and *did not* decide any question of the reasonableness of the milk ordinance, which under Illinois law is a judicial question. Therefore, all of the defendants' argument under Point II of their supporting brief (Petition, pp. 38-58) is disregarded.

CONCLUSION.

WHEREFORE, respondent prays that the Petition for Writ of Certiorari to the United States Circuit Court of Appeals for the Seventh Circuit be denied.

IN THE

Supreme Court of the United States

OCTOBER TERM, A. D. 1941.

No. 706

CITY OF CHICAGO, a Municipal Corporation, BOARD OF HEALTH OF THE CITY OF CHICAGO, DR. ROBERT A. BLACK, Health Commissioner and Acting President of the Board of Health of the City of Chicago,

Petitioners,

vs.

FIELDCREST DAIRIES, INC.,

Respondent.

CERTIORARI TO THE CIRCUIT COURT OF APPEALS FOR THE SEVENTH CIRCUIT, THERE HEARD ON APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE NORTHERN DISTRICT OF ILLINOIS, EASTERN DIVISION.

BRIEF OF RESPONDENT

STATEMENT OF THE CASE

Regarding the reasonableness of the ordinance, petitioners fail to state that the Master in Chancery who heard the evidence found (R. 1734):

> "There is, in my opinion, strong basis for a finding that plaintiff has proven by a preponderance of the

> evidence that its containers are meritorious and should be permitted to be used."

Both courts below, sitting in Illinois and being familiar with Illinois law, were in agreement that the state Milk Pasteurization Act of 1939 withdrew from the City of Chicago the power to prohibit, as distinguished from regulate, plaintiff's single service containers.

The District Court held that the ordinance was unreasonable, and therefore invalid under Illinois law, if construed to prevent the use of paper milk bottles as "standard milk bottles". Petitioners argue in their brief (pp. 34-36) that the Circuit Court of Appeals also held that the ordinance was unreasonable. That Court, after holding that the City of Chicago had no power to enforce the ordinance prohibiting paper milk bottles after the passage of the Milk Pasteurization Act of 1939, stated:

> "Having thus concluded we find no occasion to discuss at length or decide other controverted questions as to the validity of the ordinance."

In view of this statement, it is difficult to agree with the petitioners that the Circuit Court of Appeals actually decided that the ordinance was invalid for unreasonableness, but we can freely concede that the comments made in the majority opinion do not in any way disapprove the finding of the District Court on this issue.

One of the points on which we rely in this Court is that the plaintiff's paper milk bottle is a "standard milk bottle" and is therefore not prohibited by section 3094 of the Chicago ordinances. The trial court so held, but this holding was disapproved by the Circuit Court of Appeals. We believe that considerations not adequately presented to that court, but which will be found in our Point IV, below, indicate that the trial court was correct in finding that the container is a standard milk bottle.

The trial judge considered the evidence and exhibits for several months and then found that respondent's single-service containers present "no new or unusual health hazard" (R. 1752) and that respondent's single-service containers "conform with the sanitary and health requirements of the city ordinances of the City of Chicago" (R. 1753).

The trial court also found that "the evidence shows that they are safe and sanitary containers in which milk may be delivered. The uncontradicted evidence shows also that containers and receptacles less meritorious in structure and design from those of plaintiff's are in daily ouse in the City of Chicago for the sale of milk, chocolate milk, ice cream, and other liquids by drug stores, hotels, restaurants and soda fountains. . . The dispensing of such articles—including milk and milk products—in paper containers is not, as shown by the evidence, deemed to create any hazard to the public health" (R. 1752-1753).

We respectfully contend that in determining the meaning and validity of the ordinance in question and the effect of the 1939 Milk Pasteurization Act enacted by the legislature, the Circuit Court of Appeals and the trial court were bound to decide the issues of law according to the law of Illinois as pronounced by legislative action and by the decisions of the Supreme Court of the State. *Vandenbark* v. *Owens-Illinois Glass Co.*, 311 U. S. 538, 543. Adopting the rule set forth in this decision, the Circuit Court of Appeals and the trial court found the issues of law in favor of the respondent and we submit that their decisions are in harmony with the law of the State of Illinois.

ARGUMENT

I.

The Ordinance Is Repugnant to the Illinois Statute of 1939 and Is Therefore Invalid.

[Answer to Petitioners' Brief, pp. 12 to 33.]

The city contends (pp. 17-22) that the Illinois Milk Pasteurization Act of 1939 (Ill. Rev. Stat. 1939, c. 56½, pars. 115-134) did not—contrary to the opinion of both courts below—withdraw from the City of Chicago the power to prohibit the use of paper bottles. We strongly contend that it did, and that the trial court, as a Federal Court, was bound to and properly did give effect to the state law, although it was enacted during the pendency of the suit. *Vandenbark* v. *Owens-Illinois Glass Co.*, 311 U. S. 538.

No Illinois case interpreting the statute involved has been cited and so far as we know no Illinois court has passed on it. We agree that the Federal Courts, in which the present suit was pending, were entirely competent to decide the question of Illinois law and that this Court is likewise competent to decide the question of local law if it is willing to add or substitute its judgment for that of the courts below.

On pages 31-34 of their brief, the petitioners show that there is nothing in *Railroad Commission of Texas* v. *Pullman Co.*, 312 U. S. 496 (1941) or in *Hawks* v. *Hamill*, 288 U. S. 52 (1933) which should preclude a decision of the question of local law by a Federal Court. The only con-

trary intimation that has ever been made in this case appeared in the petition for certiorari (pp. 36-38) and in petitioners' reply to our answer (pp. 3-4), and we can therefore agree with the statement on page 31 of the petitioners' present brief:

> "The position of the petitioners on this aspect of the case requires an explanation."

Jurisdiction of the Federal Court was invoked in the present case solely because of diversity of citizenship and we know of nothing in any decision of this Court in any way disabling the District Court or the Circuit Court of Appeals from deciding as a matter of local law the effect to be given to an Illinois statute passed while suit was pending. The fact that the statute was passed while suit was pending is sufficient proof that plaintiff did not select the forum with its eye to a favorable ruling as to the meaning of the statute.

The construction of the statute being one of local law, we think that the recent opinion of this Court in the case of *MacGregor, Jr. v. State Mutual Life Assurance Company of Worcester, Massachusetts,* (No. 179, October Term, 1941, decided February 16, 1942), might well be adopted in the present case. There, after allowing certiorari and hearing oral arguments, this Court filed the following *per curiam* opinion:

> "Petitioner brought this action to recover the premium of a life annuity contract purchased by his decedent. The suit was begun in a state court of Michigan, but was removed, because of diversity of citizenship, to the United States District Court for the Eastern District of Michigan. Petitioner's claim is founded on the applicability of Michigan legislation regulating the conduct of insurance business in Michigan. The District Court held that 'the contract involved herein having been executed outside the State of Michigan, the

statutes of the State of Michigan relied upon by the plaintiff are not applicable.' Accordingly judgment went against petitioner. This judgment was affirmed by the Circuit Court of Appeals, 119 F. 2d 148.'

"No decision of the Supreme Court of Michigan, or of any other court of that State, construing the relevant Michigan law has been brought to our attention. In the absence of such guidance, we shall leave undisturbed the interpretation placed upon purely local law by a Michigan federal judge of long experience and by three circuit judges whose circuit includes Michigan." Affirmed.

In the present case the trial judge was for many years a lawyer of the Illinois bar, was an assistant attorney general of the State, president of the Illinois Constitutional Convention of 1920, and a member of the Federal district bench since 1929. The author of the majority opinion of the Circuit Court of Appeals likewise was an Illinois practitioner of long standing (having been admitted to the Illinois bar in 1910) and was a representative in Congress and a Federal district judge before his elevation to the Circuit Court of Appeals.

The concurring judge in the Circuit Court of Appeals, although not a member of the Illinois bar, has since 1929 been a member of the Circuit Court of Appeals of the 7th Circuit, which disposes yearly of a large number of cases arising in Illinois and which itself sits in Illinois. In fairness, it must also be said that the judge dissenting in the Circuit Court of Appeals has been judge of the Eastern District of Illinois since 1922, and had previously been a practicing attorney in Illinois since 1904. We think that the presence of a dissenting opinion does nothing more than raise a doubt as to the proper interpretation of the Illinois law which should be resolved in favor of the sovereign state as done by the other three judges

of the two courts below who held views contrary to the dissenting opinion.

We mention the personnel of the courts below who passed upon this case because of the reference in the *MacGregor* opinion to "a Michigan federal judge of long experience and by three circuit judges whose circuit includes Michigan."

We assume that this Court looks not only to the specific qualifications of the personnel of the courts below but also to the fact that they as courts dealing frequently and intimately with matters peculiarly of local law are presumed to be competent to decide such questions correctly. We felt that these considerations were relevant reasons why this Court need not grant the petition for certiorari in this case and we now feel that upon a fuller examination of the case they will be found to be good reasons for an affirmance.

We submit that in case of doubt whether certain power lies with the sovereign state or with its instrumentality, a proper regard for the relationship between the Federal courts and the sovereignty of the state dictates that such doubt be resolved in favor of the sovereign rather than in favor of its instrumentality, such as a municipality. In the absence of authoritative decision of the question by a state court, expediency requires that the doubt be resolved in favor of the sovereign rather than in favor of the creature of the sovereign. Should the decision of a doubtful question in favor of the creature be contrary to later decision of the question by a state court, the Federal court will in the interim have permitted the mere instrumentality of the sovereign to delay the carrying out of state policy. Less harm can result from a decision in favor of the sovereign than one

in favor of its instrumentality. All doubts should be resolved in favor of the unimpeded action of the sovereign state and no surrender of power by the sovereign to its instrumentality should be implied by a Federal court.

Therefore, unless the decision be too clear for argument, the question whether the power remains with the sovereign state or has been surrendered to its instrumentality ought to be decided by a Federal court in favor of the sovereign state. Of course, the petitioners here contend that the decision whether it has the power to prohibit paper milk bottles which the sovereign state has legalized is too clear for doubt. Their position would be more impressive had not both courts below held precisely contrary to the petitioners' contention.

In passing, it should be said that the attempt on the part of the petitioners to make it appear that the Circuit Court of Appeals has taken some power away from the state legislature of Illinois is entirely fallacious. Petitioners say (Brief, p. 30):

> "The boundary between the fields of state and local regulations may not be clearly defined. The decision of the Circuit Court of Appeals in effect takes away from the state legislature the power to fix the boundary and the court, in the exercise of its function to construe statutes, assumes the power itself."

The Circuit Court of Appeals did not hold that the matter was beyond the power of the legislature, but simply held that in the exercise of its power the state legislature had established a public policy for the state which prohibited the enforcement of an ordinance outlawing what the state legislature had approved. The petitioners' real complaint is not that the decision of the Circuit Court of Appeals took any power away from the legislature, but that the court wrongly construed the language of the legislature

in exercising its undoubted legislative power. The decision takes nothing from the power of the state legislature. It does take away from the city the power to defeat, by prohibiting paper milk bottles, the liberal and progressive attitude of the state toward the use under proper regulations of modern containers for milk.

The courts below properly decided that adequate protection of the sovereign power of the State of Illinois and the realization of its objectives in passing the Milk Pasteurization Act of 1939 required a holding that its creature, the City of Chicago, had not been left with the power to defeat such objectives by prohibiting the use of paper containers in the sale of milk. Such a holding does not improperly take away power from the state. It actually reinforces and protects the power of the state from impairment by judicial implication from doubtful language contained in an ambiguous statute. In this holding of the Circuit Court of Appeals we find no refusal by that court—"in effect" or otherwise—to give full recognition to the power of the state legislature.

The consideration by the petitioners of the effect of the Milk Pasteurization Act of 1939 on the power of the City of Chicago to prohibit the use of single service containers for the sale of milk is prefaced by a discussion of certain preliminary matters which we shall refer to here in the order in which they appear in petitioners' brief.

(1) In the first place, a municipal corporation, in Illinois, may exercise only such power as is conferred upon it by the state legislature. Doubt concerning the existence of a power or whether such power has been withdrawn is resolved against the municipality. The doctrine of "home-rule" has received no recognition.

The City of Chicago has no inherent power. It is a

creature of the General Assembly. To prohibit any article, it must be able to point to a state statute giving it power to do so. Furthermore, grants of power to municipalities are strictly construed. This is established by a long line of cases, has been the subject of frequent public criticism by the distinguished corporation counsel of Chicago, Mr. Barnet Hodes, but continues to be the law of Illinois, controlling in this case (*Bullman* v. *City of Chicago*, 367 Ill. 217 [1937]).

Hodes, *Law and the Modern City** (1937) says (pp. 36, 38):

> "Over and over, the Illinois Supreme Court has clung to the traditional view of all jurisdictions, and has declared: A city 'may exercise only such powers as are expressly delegated to it by the legislature and such as are necessarily implied from those expressly given.' And also: A city 'possesses no inherent power.' Time and again, cities have attempted, first by one device and then by another, to break through the barrier set up by these interpretations. But there has been little success in this direction."
>
> . . . . . .
>
> "In applying the rule of strict construction whenever cities claim the right to exercise certain powers, the courts are following a well settled principle which, as much as anything else, hamstrings municipalities. This rule, as reiterated in *Arms* v. *City of Chicago*, [314 Ill. 316] a 1924 case, is:
>
> > "'Statutes which grant powers to municipal corporations are strictly construed, and any fair or reasonable doubt of the existence of such powers is resolved against the municipality which claims the right to exercise them.'"

* The author's preface states:

"The author, of course, accepts full responsibility for the views expressed. They in no way express any official position of the law department of the City of Chicago".

The Illinois rule was stated thus in *City of Chicago* v *Murphy*, 313 Ill. 98 (1924), (at p. 101):

> "Cities may exercise only such powers as are expressly delegated to them by the legislature. The legislature is vested with all powers not taken from it by the State or Federal constitution. Many of its powers may be delegated by it to the cities created by its act. Cities are creatures of the legislature and derive their existence therefrom. They have no inherent powers. All powers of cities are derived from acts of the legislature. The fact that the legislature has the power to enact a law does not confer that power upon city councils but the same must be by legislative act conferred."

In *Consumers Co.* v. *City of Chicago*, 313 Ill. 408 (1924) the Supreme Court of Illinois has expressed the rule in the following language (pp. 411-412):

> "A municipal corporation possesses and can exercise the following powers, and no others: First, those granted in express words; second, those necessarily implied in or incident to the powers expressly granted; and third, those essential to the accomplishment of the declared objects and purposes of the corporation, —not simply convenient but indispensable. (*Huesing* v. *City of Rock Island*, 128 Ill. 465; 1 Dillon on Mun. Corp.—5th ed.—sec. 237.) Any fair or reasonable doubt concerning the existence of the power must be resolved against the municipality and the power denied. (19 R. C. L. 769; *City of Chicago* v. *M. & M. Hotel Co.*, 248 Ill. 264; *City of Chicago* v. *Pettibone*, 267 id. 573.)"

As corollaries to the rule that the powers of a municipality come from the General Assembly and are strictly construed are the rules that (1) a municipality may not exercise a power inconsistent with any Act of the General Assembly or with the public policy declared by it and (2) the power granted by the General Assembly may be

withdrawn or curtailed at the will of that body. The General Assembly may resume at any time the power previously delegated to a municipality, and this, of course, may be done by implication.

This doctrine of municipal law is also well stated by the distinguished corporation counsel of the City of Chicago in *Law and the Modern City* (Hodes, 1937, p. 44) as follows:

> "We have seen, up to this point, how two salient principles are invoked to restrict cities—the principle of express authority from the state, and the canon of strict construction against the city. Suppose a city, in its effort to control its own destiny sails by those two shoals. Is it then safe in the sea of state control? Hardly. Ahead is a rew reef.
>
> "The new peril is the principle that if the state sees fit to exercise power in its own name over an activity, the city is at once thrust out of the picture. This is the case even where the city has had jurisdiction for generations and its right to exercise the power has been heretofore firmly established. Application of this principle in Illinois has resulted in a gradual whittling away of many powers of cities, ranging in importance from control of beauty shops, to regulation of transportation lines and other utilities."

In *City of Chicago* v. *Jensen*, 331 Ill. 129 (1928), the defendant was convicted of operating a beauty parlor without a license, in violation of an ordinance of the City of Chicago. Prior to this conviction a state statute went into effect, providing for the regulation of beauty culture. On appeal, the judgment of conviction was reversed, the court pointing out that the ordinance was inconsistent with the after-enacted statute. In discussing prior decisions of the Supreme Court, and the rule of law to be drawn therefrom, the court said (p. 131):

> "This court held that while the legislature may delegate power to a municipality to grant a license

for a particular occupation and exact a license fee therefor, it may at any time take away such power and the State may resume the exercise of the power; that the legislature may repeal or amend any of the provisions of the act for the incorporation of cities and villages at pleasure, and if the provisions of the statute are inconsistent with the powers conferred on the city, the statute will operate as a repeal or amendment of the powers so conferred upon the city; that a city, as a subordinate political authority, cannot interfere with the validity or force of a license issued by the State under a statute; that the statute controls the whole subject matter.

"The statute repealed any power the city may have had to regulate and license beauty culture, the judgment convicting appellant was erroneous, and it will be reversed."

In a case well known in Illinois, *Northern Trust Co.* v. *Chicago Rys. Co.*, 318 Ill. 402 (1925), holding that the Public Utilities act of Illinois repealed by implication the power granted to cities and villages to regulate such matters as headlights on street cars, it was argued that since the ordinance requiring street cars to be equipped with brightly lighted headlights was passed prior to the enactment of the first Public Utilities act, the ordinance would not be abrogated until the Commission had taken some action under the statute inconsistent with the ordinance. The court said (p. 412):

"When the first Public Utilities act came into force, on January 1, 1914, the power of the city over the subject matter of that act ceased to exist, and it could not thereafter pass new ordinances or enforce existing ordinances with reference to matters within the exclusive jurisdiction of the Public Utilities Commission. The power to enforce proceeds from the present or existing power or authority to enact or to provide. A municipality cannot be said to possess the power to enforce an ordinance concerning a subject upon which it has lost the power to pass the ordinance.

> Any attempt to enforce in such a situation would be defeated by interposing the act withdrawing the municipality's power to enact."

In the early case of *Wilkie* v. *City of Chicago*, 188 Ill. 444 (1900), a Chicago ordinance required persons desiring to work as plumbers to obtain a license and pay an annual license fee of $30.00. Shortly thereafter the legislature of Illinois passed an act providing that persons desiring to engage in the business of plumbing should be examined as to their qualifications by a board created for that purpose and that successful applicants should receive certificates. In a suit to restrain the enforcement of the ordinance on the two-fold ground that (1) the city was without power to license the business of plumbing, and (2) even if it had such power, the ordinance was in conflict with the later statute, and hence invalid, the Supreme Court affirmed a decree restraining the enforcement of the ordinance.

After pointing out that the power of the city to license the occupation of plumbing was, at least, very doubtful, the court said (pp. 452-453):

> "While the legislature may delegate the power to municipalities to grant a license for a particular occupation and to exact a license fee, they may, at any time, take away such power or resume the exercise of it themselves. The legislature may repeal or amend any provision of the act for the incorporation of cities and villages at their pleasure, and if the provisions of the act of 1897 are inconsistent with the power claimed by the city, they will operate as a repeal or amendment of the charter to that extent. * * * By this law the legislature have prescribed the test which shall enable a person to engage in the business of plumbing, and the city, by its proviso, has prescribed another and additional test. The legislature, by the law, say he is authorized to work at his trade throughout the State if he has the required

certificate. The city of Chicago, by the proviso to the ordinance passed in pursuance of that law, says that he shall not work at his trade in that city except by paying $30 additional and receiving another license. The city, as a subordinate political authority, cannot interfere with the validity or force of the license issued by its board under the law. That these provisions are inconsistent is plain."

The force and logic of this decision is inescapable. It is clearly determinative of the invalidity of the prohibition of paper bottles which the City of Chicago seeks to enforce and thereby forbid what the superior political authority approves and permits. The majesty of the state law applies to Chicago ordinances now with the same force as it did forty years ago.

The texts on the subject of municipal legislation announce the same rule. See 2 McQuillin on Municipal Corporation, 572 (2d. ed.—1928), quoted by the Circuit Court of Appeals.

In 43 Corpus Juris, 215-217, "Municipal Corporations," the additional rule is stated that a municipal ordinance must not conflict with the public policy of the state as determined by the state legislature, thus:

> "Since a municipal corporation is a creature of the state, continuing its existence under the sovereign will and pleasure of the state, possessing such powers and such only as the state confers upon it, subject to addition or diminution of power at the state's supreme discretion, municipal regulations *must not directly or indirectly contravene the general law, nor can such regulations be repugnant to the policy of the state as declared in general legislation.*" (Italics ours.)

The Illinois cases are uniformly to the same effect.

In *City of Chicago* v. *Union Ice Cream Mfg. Co.*, 252 Ill. 311 (1911), cited by the petitioners (Brief, pp. 12-13)

the Supreme Court passed upon the validity of Section 1160 of the Municipal Code of Chicago which then provided for a penalty of not less than $5.00 nor more than $100.00 fine for any person who sold or offered for sale any impure or adulterated food. A statute, the Pure Food Act of July 1, 1907, enacted two years after Section 1160 of the Municipal Code was passed, provided for a greater penalty. In sustaining the ordinance as valid the court said (p. 313):

> "*The laws of the state operate within the limits of municipal corporations the same as elsewhere, unless otherwise clearly provided by municipal charters or statute. Local laws and regulations are at all times subject to the paramount authority of the legislature.*" (Italics ours.)

In the last paragraph of this decision the Supreme Court used the following language which is indeed applicable to the ordinance here, saying at p. 315:

> "Municipal authorities cannot, under a general grant of power, such as article 5 of the City and Village act, *adopt ordinances which infringe the spirit of a State law or are repugnant to the policy of the State as declared by general legislation*, but the police regulations of a municipality may differ from those of the State upon the same subject, if they are not inconsistent therewith. (*McPherson* v. *Village of Chebanse*, 114 Ill. 46.) *This ordinance does not prohibit what the statute permits.* While the ordinance attaches a less penalty for its violation than does the statute, we find no repugnancy between them. The general policy under both is the same." (Italics ours.)

The pertinent language in this decision is "this ordinance does not prohibit what the statute permits." Obviously this is the test to be applied when an ordinance and state statute are to be construed.

In *City of Chicago* v. *Drogasawacz*, 256 Ill. 34 (1912) the

regulation of the bread and bakery business by ordinance was involved. The principal question was the right of the city under the state statutes to enact the bakery ordinance. The ordinance was sustained as valid, not being in conflict with the statute, and on page 37 the Court said:

> "Municipal ordinances must be in harmony with the general laws of the State (*City of Chicago* v. *Union Ice Cream Mfg. Co.*, 252 Ill. 311), but this ordinance does not in any way conflict with the State law."

Again, in the case of *City of Marengo* v. *Rowland*, 263 Ill. 531 (1914) the court held an ordinance of the City of Marengo requiring the closing of barber shops on Sunday invalid and again stated on page 534:

> "Municipal authorities, under general grant of power, cannot adopt ordinances *which infringe the spirit of a State law or are repugnant to the general policy of the State* (*City of Chicago* v. *Ice Cream Co.*, 252 Ill. 311; 25 Am. & Eng. Ann. Cas., 675 note; *City of Clinton* v. *Wilson*, [257 Ill. 580] *supra.*) The public policy of the State is found in its constitution and statutes, and, when they are silent, in its judicial decisions and the constant practice of its public officials." (Italics ours.)

We submit that if, as the court said in these decisions, a city cannot adopt an ordinance infringing the *spirit of a state law*, then it certainly cannot by any process of reasoning, enforce one. Since the legislature has clearly expressed the *public policy* of Illinois on health and the use of single service milk containers, such public policy is not to be rendered inoperative by ordinances or regulations of a city repugnant to it whether passed before or after such statute.

In *City of Lewistown* v. *Harrison*, 282 Ill. 461 (1918) the Illinois Supreme Court held that an ordinance which prohibited the *barter, exchange or sale* of intoxicating

liquor was authorized by the Illinois Cities and Villages Act, which gave to municipalities the power to prohibit the *sale* of such liquors. To make more definite and specific by ordinance what is provided by general legislation is not a violation of statute, but merely makes its application more certain. But if the ordinance were in conflict with the spirit of state law, with public policy or inconsistent with the language of the statute, then it would be invalid. The rule was clearly expressed by the court in the following words (p. 464):

> "A municipality may by ordinance restrict, regulate and prohibit the same acts which are punishably and penalized under the law of the State, so far as authorized so to do by law. It may make more definite regulations than are usually provided by general legislation and enforce them by appropriate penalties. It cannot, however, adopt ordinances which *infringe the spirit of a State law* or are *repugnant to the policy of the State* as declared by general legislation, but the police regulations of a city may differ from those of the State on the same subject *if not inconsistent therewith.*" (Italics ours.)

The fundamental weakness in the Chicago ordinance in question is that it prohibits (if construed as petitioners contend) what the statute *in express terms* permits. It is not an effort to fill in the details of a broad, general statute. To adopt and enforce a construction *prohibiting* the use of *single-service containers* would result in nullifying a provision of the statute, which is the paramount regulation. Legislatures are not subservient to municipalities in establishing public policy.

In construing Section 38 of the Illinois Prohibition Act and an ordinance enacted by the City of Litchfield which prohibited the manufacture and sale of intoxicating liquor, the Supreme Court of Illinois in *City of Litchfield*

v. *Thorworth*, 337 Ill. 469 (1929) pointed out that the city was bound by the definition of intoxicating liquor contained in the statute and had no authority to prohibit the sale of liquor not prohibited by the statute. At page 475 the court said:

> "Section 2 of the Prohibition Act defines the phrase 'intoxicating liquor.' It is the sale of liquor of the kind specified in the statute that is prohibited. The statute confers authority on municipal corporations to prohibit by ordinance the sale of the kind of liquor prohibited by the statute. *The municipality is bound by the definition contained in the statute and cannot prohibit the sale of liquor not prohibited by the statute.*" (Italics ours.)

It is clear beyond peradventure from the foregoing cases that the City of Chicago has no inherent power, that its power to regulate milk comes from the State, that the State has the right to take that power away before or after the enactment of the city's ordinances, that the ordinances must not be in conflict with the provisions of the State statutes, and that the city has no right to prohibit what a state statute or valid rules and regulations adopted pursuant thereto permit.

It will be well to bear in mind those general rules in considering the "saving clause" which the City relies on, namely, Section 19 of the Act. Before passing to a discussion of that question, we wish to call the Court's attention to another limitation on the power of the city shown by the case of *City of Rockford* v. *Hey*, 366 Ill. 526 (1937). In that case it was held that the City of Rockford had no power (under the same sections of the statute that the City of Chicago is relying on in the present case) to prohibit the sale in Rockford of ice cream manufactured in Sterling, Illinois, and Dixon, Illinois, by requiring a license (involving an inspection of the factories by Rock-

ford inspectors) as a condition precedent to such sale. This is the latest word of the Illinois courts on the subject. The Court said (p. 530):

> "In Illinois, a city organized under the Cities and Villages act has such powers, only, as are therein expressly delegated by the General Assembly or necessarily implied to render the grant of specific powers effective".

and (p. 531):

> "Legislative powers of municipal corporations are strictly construed, and *any rational doubt* as to the existence of power must be resolved against the municipality." (Italics ours.)

The Court then concluded (pp. 533-534):

> "In short, the issue is whether plaintiff, the City of Rockford, may require ice cream factories, located in other cities, to meet sanitary requirements prescribed by the former city in order to entitle them to Rockford licenses upon payment of the annual fee for inspection of their plants.
>
> "Municipalities have no extra-territorial jurisdiction except insofar as it is expressly or impliedly delegated by statute. (55 A. L. R. 1183; *City of Chicago* v. *Brent*, 356 Ill. 40; *Strauss* v. *Town of Pontiac*, 40 id. 301.) An inherent or implied limitation upon the city in the exercise of the powers delegated to it by the legislature is that such powers shall be exercised within the corporate boundaries of the municipalities.
>
> . . . . . .
>
> "The legislature has not delegated power to municipal corporations to pass a regulatory and license ordinance which assumes to regulate ice cream factories outside their corporate limits. The provisions which plaintiff admits extend to ice cream factories in other cities are so inseparably connected with other provisions applicable locally as to render the entire enactment void."

It is clear under this case that control of the respondent's plant at Chemung, McHenry County, Illinois, is exclusively within the jurisdiction of the Department of

Health of the State of Illinois and that the State statute (Petitioner's brief, Appendix A, p. 80) relating to pasteurized milk which provides, in part, that all pasteurized milk shall be placed in its final delivery containers at the plant, that bottling or packaging of milk shall be done at the place of pasteurization by approved mechanical equipment, and that it shall be unlawful for any person to sell or serve any pasteurized milk except in the original container in which it was placed at the point of pasteurization, contemplates the approval of the State Department of Health of respondents' operations and equipment without requiring the approval of the City of Chicago.

It is further apparent that if, after the state has approved respondent's plant and equipment for packaging milk in paper bottles, only, and has prohibited the respondent from selling its milk in any containers other than those in which it was placed at the point of pasteurization, the City of Chicago is permitted to stop that milk at its city limits and forbid its sale, the city is thereby permitted to exercise indirectly an extra-territorial power over the respondent's plant and equipment which the *Hey* case expressly forbids. The City of Rockford was therein denied power to prohibit, by an inspection requirement, *the sale in Rockford* of ice cream made elsewhere.

It is important to notice this geographical division of authority between the State of Illinois and the City of Chicago, because the sole reliance of the City of Chicago for its power is on cases like *Koy* v. *City of Chicago*, 263 Ill. 122; *City of Chicago* v. *Bowman Dairy Co.*, 234 Ill. 294, and *City of Chicago* v. *Union Ice Cream Co.*, 252 Ill. 311, where the pasteurizing or manufacturing plant was located within the confines of the City of Chicago.

(2) It is true, as the petitioners contend (Brief, p. 12),

that there is no constitutional objection to regulation of the same subject by statute and ordinance. Aside from the constitutional question this rule is subject to the qualification that the ordinance must be in harmony with the statute and with state policy; in the event of conflict or inconsistency the ordinance must give way. This qualification of the rule is elaborated in *City of Chicago* v. *Union Ice Cream Co.*, 252 Ill. 311 (1911), from which both the petitioners and we have quoted.

(3) On the question of the powers of municipalities [Petitioners' Brief, pp. 13-17], in Illinois, to regulate the sale and distribution of milk, it should be added that such regulation must be reasonable and that whether a particular regulation is or is not reasonable is a judicial question. In *Koy* v. *City of Chicago*, 263 Ill. 122 (1914), from which the defendants have quoted extensively the Court said (p. 127):

> "When the legislature has authorized a city council to pass ordinances upon any subject, the power thus conferred must be reasonably exercised. Whether its exercise in a particular case is reasonable is a judicial question, and an unreasonable ordinance will be held void by the courts."

In *City of Chicago* v. *C. & N. W. Ry. Co.*, 275 Ill. 30 (1916), the court, in holding unreasonable and therefore invalid, a section of the milk ordinance of the City of Chicago, said (p. 38):

> "The city council has authority to pass ordinances regulating this question, and the question of regulation, in the first instance, rests with the municipal authorities, but whether its exercise in a particular case is reasonable is a judicial question. There must be some logical connection between the object sought to be accomplished by such an ordinance and the means prescribed to accomplish the end. An unreasonable ordinance will be held void by the Courts." (Citing cases.)

We emphasize at this point, the necessity that an ordinance be reasonable. Whether the particular ordinance now in question is a reasonable exercise by the City of its power to regulate certain aspects of the milk industry in the interest of the public health is a matter we discuss elsewhere in detail (Points II and III, *infra*). The assertion of the city that it had power "to regulate every detail of the milk industry" (Brief, p. 15) prior to the enactment of the Milk Pasteurization Act, and that it had power to prohibit the use of single service containers, is an assumption which this suit was originally brought to challenge.

(4) The assertion (Petitioners' Brief, pp. 16-17) that the ordinance required the use of glass containers—under the construction placed by the Circuit Court of Appeals on the phrase "standard milk bottles"—is treated fully under Point IV and the applicable rule of law is discussed. It is sufficient here to point out that under a more recent decision of the Supreme Court of Illinois than that cited to and relied on by the Circuit Court of Appeals the meaning of legislative language is not static. The fact, therefore, that single service containers were not in general use on January 4, 1935,—the date of the enactment of the ordinance—and consequently were not considered by the City Council at that date as being "standard milk bottles" does not preclude such containers from being within the meaning of that phrase in interpreting the ordinance today. We submit that the correct interpretation of the ordinance was adopted by the District Court which found single service containers to be "standard milk bottles".

Effect of the 1939 Statute on the Powers of Cities.

After pointing out that Section 19 of the Milk Pasteurization Law of 1939, is in the same language as the title of the A[illegible], the petitioners develop in detail their contention that, by reason of that section, "whatever aspects of the milk industry may be subjected to statewide regulation by the statute, cities and villages retain to the fullest extent every power that they had theretofore" (Petitioners' Brief, p. 19). This result is said to be revealed by a "cursory reading of the saving clause" and "a detailed exposition of the language of the section leaves no possible doubt" (Brief, p. 19).

Before discussing the analysis or exposition of this section of the Milk Pasteurization Act of 1939, and its effect on the regulatory powers of the City of Chicago over certain phases of the milk industry, that Act must be considered in relation to previous legislation on the same subject.

In 1925 the General Assembly enacted "An Act in relation to the pasteurization of milk." (Smith-Hurd Ill. R. S., 1925, c. 56½, pars. 101-113.) In 1935, this Act was amended. (Ill. R. S. 1937, c. 56½, pars. 101-114). As amended it was in force until the enactment of the present statute, Section 20 of which provides:

> "The Act entitled 'An Act in relation to the pasteurization of milk', approved June 30, 1925, as amended June 29, 1935, is hereby repealed."

The earlier Act provided for application to, and issuance by, the State Department of Public Health, of a Certificate of Approval to persons or firms engaged in operating a pasteurization plant who comply with the provisions of the Act. The Act imposed certain requirements with respect to the construction of such plants, for

certain apparatus for recording temperatures during pasteurization and for filter tests for sediment or stain. In addition, employees in pasteurization plants were required to furnish annually to the State Department of Health a medical certificate showing them to be free of certain specified diseases, and provision was made for an "automobile laboratory" to enable the Department of Health to make chemical and other scientific analyses. Upon failure to comply with the requirements of the statute, provision was made for revocation of the certificate of approval, and a penalty was fixed for violation thereof.

In 1939 the legislature enacted the present Milk Pasteurization Act. The two Acts cover the same subject matter, but in the present statute each provision is treated with an elaboration not present in the earlier Act. New requirements are added and the old made more stringent.

There is, moreover, another major difference in the Acts. What might be characterized as a "saving clause" in the old Act, but which it would perhaps be more accurate to describe as an "exception," provides:

> "The provisions of this Act do not apply to pasteurization plants located in and furnishing milk or milk products for consumption in municipalities containing 500,000 or more inhabitants, according to the last census, which have established a system of regulation and inspection of the pasteurization plants supplying milk for consumption in such municipalities or to any pasteurization plant which supplies milk or milk products solely for consumption in such municipalities." (Ill. R. S. 1937, C. 56½, "Foods", par. 113.)

The evident purpose of this section was to exclude the City of Chicago from the operation of the statute, since no municipality in Illinois, then or now, except Chicago,

satisfied the population requirement. Obviously, the legislature, in 1925, in first entering this field, was satisfied that the pasteurization regulations then in effect in Chicago were not inadequate, though even at that date it is noteworthy that the scope of the exception was confined to plants supplying products solely for consumption in that City.

The Milk Pasteurization Act of 1925 was the first attempt by the State of Illinois to regulate the distribution and pasteurization of milk. It was neither comprehensive nor exhaustive and did not cover the field in detail. The City of Chicago, alone of the municipalities in the State, by the device of population classification, was excluded from the operation of the statute. The present statute, which repealed the Act of 1925, makes standards more stringent. Additional requirements extend the scope of prior regulations. The utmost care is taken to include all important details with reference to the sale and distribution, as well as the pasteurization, of milk and to give the State Director of Health power to supplement the requirements. The application of this Act is statewide. No municipality is exempted. It is immaterial that a city or village may or may not have established a system of regulation and inspection. No longer does the City of Chicago have the exemption provided by the 1925 statute.

The intention of the legislature that the Act is to be effective throughout the state without territorial or other limitation is apparent from the language of the statute (sec. 2):

> "*Any person* operating a pasteurization plant who distributes, delivers or sells pasteurized milk or pasteurized milk products for consumption *in the State of Illinois* shall annually make application to

the Department for a Certificate of Approval." (Italics ours.)

Section 3 provides:

> "*Any person* who shall hereafter engage in operating a pasteurization plant for the purpose of distributing, delivering, or selling pasteurized milk or pasteurized milk products for consumption *in the State of Illinois*, shall before engaging in such business make application to the Department for a Certificate of Approval." (Italics ours.)

Section 9 states:

> "Any person selling, delivering or distributing milk or milk products *in the State of Illinois* who shall heat milk or milk products or subject milk or milk products to other treatment in an effort to make the milk or milk products safe for human consumption or to preserve its keeping qualities shall comply with the provisions of this Act." (Italics ours.)

Section 11 provides:

> "No milk or milk products sold, distributed or delivered *in this State* shall be heated or subjected to any other treatment in an effort to make it safe for human consumption or to preserve its keeping qualities *unless such milk or milk products are processed in compliance with the provisions of this Act.*" (Italics ours.)

Other sections of the act indicate a recognition of single-service containers and show that the state has assumed control of the equipment for the packaging of milk and prohibited its sale except in containers filled on such equipment at the point of pasteurization.

Section 8 provides:

> "All pasteurized milk and milk products shall be placed in their final delivery containers in the plant in which they are pasteurized. *It shall be unlawful*

for hotels, soda fountains, restaurants, grocery stores, milk depots, milk stations and similar establishments to sell or serve any pasteurized milk or milk products except in the original container in which it was placed at the point of pasteurization, provided that this requirement shall not apply to milk or milk products consumed on the premises which may be served from the original container or from a dispenser approved by the Department for such service. The sale or distribution of bulk, loose or dipped pasteurized milk or milk which has been heated within the purview of this Act is hereby prohibited."

The first paragraph of Section 15 is as follows:

"Any pasteurization plant coming under the provisions of this Act shall conform with all of the following items of construction; equipment, maintenance and operation *and in accordance with minimum requirements adopted by the Director for interpretation* and enforcement of this Act." (Italics ours.)

Following and as an integral part of this section are certain items, including the following:

"Item 10. All multi-use containers and equipment with which milk or milk products come in contact shall be constructed in such manner as to be easily cleaned and shall be kept in good repair. *Single service containers,* caps, gaskets and similar articles *shall be* manufactured and transported in a sanitary manner." (Italics ours.)

"Item 18. *Bottling or packaging of milk and milk products shall be done at the place of pasteurization by approved mechanical equipment.*" (Italics ours.)

Pursuant to the power therein granted, the Director of the Illinois Department of Public Health has promulgated "minimum requirements" for interpretation and enforcement of this Act, providing, in part, as follows:

"Satisfactory compliance.—This item shall be deemed to have been satisfied if: * * *

(5) All *single-service containers,* caps, gaskets and

similar articles are manufactured and handled in accordance with requirements of the Department.

(a) The buildings and rooms in which *single-service containers* and container caps and covers are manufactured, packed, stored, and handled shall be clean, well lighted and ventilated, and free of dust and flies, as prescribed in items 1, 2, 3, 4, 6, 7, 8 and 11.

(b) The average bacterial plate count of the stock from which *single-service containers* and container caps and covers are made shall not exceed 100 colonies per gram. No substance shall be present in finished single-service containers and container caps and covers which is toxic.

(c) All operations of the fabrication plant and during transportation of the manufactured articles shall be so conducted as to reduce to a minimum the possibility of contaminating the manufactured articles, as prescribed in items 13, 14 and 15.

* * * * *

(e) All *single-service containers* and container caps and covers shall be so treated *as to be as impervious to milk* and milk products as practicable." (Italics ours.)

Section 16 of the statute is in part as follows:

"The Department may either refuse to issue, or may refuse to renew, or may suspend, or may revoke any certificate of Approval because of the violation of any of the provisions of this Act or for any of the following causes:

(a) Insanitary conditions of plant surroundings within the control of the plant management, insanitary methods of handling milk, milk products or *milk containers or equipment.*

(b) Employment of careless, indifferent and inefficient personnel.

(c) Violation of any of the provisions of this Act or of the minimum requirements for interpretation and enforcement of the Act.

(d) Failure to display Certificate of Approval to the public at all times when such Certificate of Approval has been issued as provided in this Act.

(e) Displaying to the public any Certificate of Approval which has been suspended or revoked or which has expired. * * *" (*Italics ours.*)

We shall refer below to the effect to be given to Section 19 of the Act, relied upon by the City (pp. 17 to 23) as preserving its right to prohibit paper bottles which the sovereign state permits.

Another statute should be noticed, the statute (Ill. Rev. Stats. 1939, c. 111½, "Public Health", par. 22) establishing the State Board of Health, whose duties are now transferred to the Illinois Department of Health by Illinois Revised Statutes, 1941, c. 127, "State Government", par. 55. The Public Health Statute provides in part:

"Sec. 2. The State Board of Health shall have the general supervision of the interests of the health and lives of the people of the state. * * *

The Board shall have authority to make such rules and regulations * * * as they may from time to time deem necessary for the preservation and improvement of the public health, * * *

It shall be the duty of all local boards of health, health authorities and officers, * * * of the State or any * * * city * * * thereof to enforce the rules and regulations that may be adopted by the State Board of Health * * *."

It will be noticed that under the terms of the above Acts the State of Illinois, as it has the undoubted right to do, has taken unto itself the approval of not only the plant but also the equipment and methods of operation of every person who pasteurizes milk for sale in the State of Illinois. It also has occupied the following fields of milk sanitation: It requires that the "bottling or

packaging" of milk shall be done at the place of pasteurization. It requires that all pasteurized milk shall be placed in final delivery containers in the plant in which it is pasteurized. It makes it unlawful for any person in the state to sell or serve any pasteurized milk except in the original container in which it was placed at the point of pasteurization.

The State of Illinois has recognized expressly, both by the Milk Pasteurization Statute and by the lawful requirements made pursuant to it, that single-service containers (as paper milk bottles are now known), when kept as provided by the requirements and when "so treated as to be as impervious to milk and milk products as practicable" are entirely proper containers for the sale of pasteurized milk throughout the State of Illinois. There is not one phrase or word in the statute mentioning the words "standard milk bottles", but rather the entire statute is broad and uses the words "multi-use containers", "single-service containers", "container caps and covers", and "fabrication plant".

It is apparent that the legislature recognized and approved the use of single-service containers and that any construction of the ordinance in question which prohibits them is contrary to the spirit of the state statute and of the public policy it establishes.

It is contended by petitioners that the purpose of this statute is to "prescribe minimum sanitary standards" and to place "a floor under municipal milk regulations", with the result that a municipality may "impose higher standards than those imposed by the statute" (Brief, p. 22). The power thus reserved to municipalities is, petitioners argue, subject only to the limitation "that the municipal regulations must not fall below the minimum standards fixed by the state". (Brief, p. 22).

Petitioners contended in their petition for certiorari that the purpose of the saving clause was to provide state regulation in "many municipalities so small that their officers are unable to adopt and enforce adequate regulations of the milk industry" (Petition, p. 27). In their reply to our answer they claimed that this language of theirs had been misunderstood and that really "defendants' contention is that the statute is designed to prescribe minimum sanitary standards which are effective throughout the state, both in rural and urban communities". (Reply to answer to petition for certiorari, p. 11.) The latter idea is repeated in the petitioners' latest effort (Brief, p. 22) and the following comment is added:

> "The statute thus places a floor under municipal milk regulations."

If this were the legislative intention, it seems strange that language to that purpose was not used in the present saving clause. That the Illinois legislature knows how to use such language is apparent from the 1941 act in relation to Grade A Milk and Grade A Milk Products, approved July 11, 1941 (1 Ill. Session Laws, 1941, p. 809; Ill. R. S., 1941, c. 56½, "Foods", paras. 152-169) of which section 18 (Ill. R. S., 1941, c. 56½, para. 169) states:

> "Nothing in this Act shall impair or abridge the power of any city, village or incorporated town to regulate the production, handling, storage, distribution, sale or delivery of milk or milk products, *provided the minimum requirements under this Act are observed.*" (Italics ours.)

Furthermore, in the 1939 Act itself, the legislature used words which would have been appropriate to express the petitioners' present construction of the saving clause when in section 15 (Petitioners' Brief, p. 84) it referred to

"minimum requirements adopted by the Director for interpretation and enforcement of this Act".

The petitioners' contention that the statute simply places "a floor" under the city ordinance is reached by a novel method of interpretation. Because Section 15 of the Act provides that the construction, equipment, maintenance and operation of pasteurization plants shall conform with the requirements of said section and, in addition, be "in accordance with minimum requirements adopted by the Director for *interpretation and enforcement* of this Act," it is concluded that further requirements may be imposed by some agency other than the State and that this agency could only be a city or a village (Brief, pp. 21-22). If such were the intention of the General Assembly it would seem that appropriate language to accomplish that result would have been employed. In fact, however, the language itself negatives such interpretation. "Minimum requirements" is defined in Section 1 (h) as "the code formulated *by the Director for interpretation and enforcement* of this Act."

The language of the statute thus far shows no intention to permit cities and villages to occupy the same field of regulation as the state, in the sense that an ordinance of such municipality may "prohibit what the statute permits," or impose different and inconsistent requirements from those enumerated in the statute. If cities and villages may "make further and more definite regulations" (in the language of *City of Chicago* v. *Union Ice Cream Company*, 252 Ill. 311, *supra*) such regulations must "not prohibit what the statute permits", a condition laid down by the Supreme Court of Illinois in that case which qualifies and circumscribes municipal action in such instances. The power of the City of Chicago to regulate the sale and distribution of milk is conditioned by the

limitation that it shall "not prohibit what the statute permits."

The contention (Petitioners' Brief, p. 21) that there is no conflict between the ordinance which "prohibits" the use of single service containers and the statute which permits and "regulates" their use is without merit.

It is the contention of the petitioners now as it was in the trial court, that their right to prohibit paper bottles is preserved by Section 19 of the 1939 Milk Act (Ill. R. S. 1939, c. 56½, para. 133):

> "Nothing in this act shall impair or abridge the power of any city, village or incorporated town to regulate the handling, processing, labeling, sale or distribution of pasteurized milk, and pasteurized milk products, provided such regulation [does] not permit any person to violate any of the provisions of this act."

The word "does" is not a part of the act as passed, but may fairly be implied.

We turn now to consideration of the effect of this section. We have seen that prior to 1939 the sale and distribution of pasteurized milk in Illinois was regulated by statute. By express provision of that statute the City of Chicago was excepted from compliance with its requirements. The sale and distribution of pasteurized milk in all other cities and villages in Illinois was, however, controlled by the State. In 1939 the earlier statute was supplanted by the present Milk Pasteurization Act. A comparison reveals that the later Act is, in reality, an exhaustive and comprehensive revision of the earlier Act, remedying certain omissions and regulating in detail the entire field of milk distribution. By the new Act the City of Chicago is placed on the same plane as other Illinois municipalities.

The office of a saving clause is to preserve from destruction some special thing out of the general things mentioned in the statute. *Crawford on Statutory Construction*, page 612 (1940); 2 *Lewis' Sutherland on Statutory Construction*, 678 (1904). Since its function is not to repeal the main provisions of the Act, no saving clause should be so construed as to destroy those provisions. Yet the contention of the petitioners that municipalities may forbid what the statute permits is to render the Act *inoperative* to that extent. If the City of Chicago may prohibit the use of single service containers which are expressly sanctioned by the statute, is there any reason why it may not "in a desire to exercise the utmost vigilance" require a different method in the pasteurization of milk although Section 11 of the Act specifically provides that no milk sold or delivered in the State of Illinois shall be subjected *to any other treatment* to make it safe for human consumption than the processing provided by the Act? And if the City of Chicago may forbid the use of single service containers for the sale and delivery of milk within the municipal confines, is there any reason why it should not require additional or different methods of operation in pasteurization plants within the territorial limits of such city, although Section 4 of the statute provides that upon compliance with the provisions of the Act the Director shall issue a Certificate of Approval to persons applying therefor? And if it may impose such additional requirements, is not such Certificate of Approval rendered ineffective?

One difficulty with the City's argument that the statute establishes "minimum requirements" is in answering the question: Who determines whether a requirement is a minimum or a maximum? Is the City's judgment on that question to prevail against the State's?

It is clear that the only effect to be given to Section 19 is, first, that it prevents a repeal by implication of all power of the municipality to regulate milk, and, second, that the city's power continues unimpaired as to all of those numerous matters not governed by the statute or by the minimum requirements promulgated pursuant thereto. It gives the City no right to enforce ordinances in conflict with the statute or the regulations made thereunder.

That this is true is apparent from the proviso to Section 19, which expressly prohibits any city, village or incorporated town from permitting "any person to violate any of the provisions of this Act." To violate is "to infringe on", "to disturb", "to disregard". If a municipality may not permit any person "to infringe on, or to disturb, or to disregard" any provision of the Act, such municipality may not *itself* "infringe on, or disturb, or disregard" any provision of the Act. But to forbid the use of single service containers, the use of which is expressly sanctioned by the statute, is "to infringe on or to disturb or to disregard" the plain language of the statute.

Petitioners place great reliance upon *City of Ottawa* v. *Brown*, 372 Ill. 468 (1939), which involved the following saving clause in "An Act to regulate the Storage, Transportation, Sale and Use of Gasoline and Volatile Oils", in force July 1, 1919 (Ill. Session Laws, 1919, p. 692; Hurd's Illinois R. S. 1919, c. 38, Criminal Code, par. 54q).

> "Except in cities or villages where regulatory ordinances upon the subject are in full force and effect, the Department of Trade and Commerce shall have power to make and adopt reasonable rules and regulations governing the keeping, storage, transportation, sale or use of gasoline and volatile oils."

The petitioners point out that in this decision the Supreme Court of Illinois held that a municipality in which, on July 1, 1919, regulatory ordinances on the subject were in force, had the power to amend its ordinance later without regard to any conflict between city and state regulation.

The important thing about the saving clause in this statute is not that it was given the effect shown in *City of Ottawa* v. *Brown*, but that the Supreme Court in a previous case gave to the saving clause a narrow construction which withdrew all the power to regulate the subject matter involved from all municipalities except those which *at the effective date of the act* had ordinances in force dealing with such subject matter. The previous case was *Kizer* v. *City of Mattoon*, 332 Ill. 545 (1928), where the court had before it the validity of an ordinance of the City of Mattoon enacted after July 1, 1919, purporting to regulate the keeping, storage, sale, etc., of gasoline. Plaintiffs sought an injunction against the enforcement of the ordinance and losing in the trial court were appellants in the Supreme Court of Illinois. There the plaintiffs contended that the legislature had taken the power of regulation from cities by the act of July 1, 1919, and the defendants contended that under clause 65 of Section 1, Article 5, of the Cities and Villages Act enacted in 1874 (which is the act relied on by the City of Chicago here), the City of Mattoon had the power to enact and enforce the ordinance. The City of Mattoon contended that the act of 1919 did not repeal its power under clause 65 and "that there is not such clear repugnancy between the provisions of these laws that they cannot all be carried into effect". The court said (pp. 549-550):

"The power to pass ordinances such as the one

here in question was delegated to cities by the State through its legislature. Where the State delegates such power to a municipality it may resume it through legislative action and thus deprive the municipality of the right to exercise it. (*City of Chicago* v. *Phoenix Ins. Co.*, 126 Ill. 276; *Wilkie* v. *City of Chicago*, 188 *id.* 444.) Prior to July 1, 1919, the exclusive power of regulation here involved was lodged in cities and villages by virtue of clause 65 above quoted. By its act to regulate the storage, transportation, sale and use of gasoline and other volatile oils, in force July 1, 1919, the State withdrew from municipalities this exclusive power of regulation and gave to the Department of Trade and Commerce exclusive power to make and adopt reasonable rules and regulations governing the keeping, storage, transportation, sale or use of gasoline and volatile oils, except in cities or villages where regulatory ordinances upon the subject were in full force and effect. * * * The City of Mattoon on July 1, 1919, not having in full force and effect regulatory ordinances on the subject, its delegated power to enact such ordinances was automatically withdrawn by the State and the exclusive power to make such regulations for the City of Mattoon became vested in the Department of Trade and Commerce. The City of Mattoon having been divested of this power by the State, could not by its own action re-acquire such power, but could only regain it by subsequent action on the part of the legislature."

It will be noticed that in the above case the court construed the words "regulatory ordinances upon the subject are in full force and effect" as meaning in effect on July 1, 1919, when the act became effective. A logical construction of such language would require the words "are in full force and effect" to mean "are in full force from time to time". Logically there is no reason for giving greater force and effect to an ordinance in force on July 1, 1919, than one enacted on July 2, 1919. The

fact is that a later ordinance would probably be a better informed effort than an earlier one. Notwithstanding the apparent logic of this consideration, the Illinois Supreme Court gave the ordinance the strictest possible construction in favor of state regulation—in favor of withdrawing from municipalities power which they had had under the general Cities and Villages Act upon which the petitioners in this case place their complete reliance.

Other courts have given saving clauses a narrow construction.

In *State ex rel. Knise et al.* v. *Kinsey*, 314 Mo. 80, 282 S. W. 437 (1925), an original petition for mandamus was filed in the Supreme Court of Missouri to compel the Board of Public Service of the City of St. Louis to issue permits to the relators to sell milk in that city. An ordinance of the city forbade the sale of "raw" or unpasteurized milk within the confines of the municipality.

The State Legislature had also by statute classified and defined various types of milk and milk products and established standards of purity for such dairy products. "Raw" or unpasteurized milk was one of the types of milk thus defined by the statute.

In contending that there was no conflict between the ordinance which prohibited the sale of unpasteurized milk, and the statute which recognized raw milk as a lawful product, the City of St. Louis placed great reliance on Section 8646 of the Missouri statutes which provided:

> "All cities and towns in the state shall have power, by ordinance, to license and regulate milk dairies and the sale of milk, and provide for the inspection thereof."

The relators contended that since "raw" or unpasteurized milk was declared by statute a lawful product

that the City of St. Louis was without power to prohibit its sale, and that the ordinance purporting so to do was void. The Court agreed with this contention and said (pp. 438-439 of 282 S. W.):

". . . This statute shows a very comprehensive plan in defining and specifying different milk products which it may be lawful for persons to deal in. Section 8646, quoted above, relating to cities, of course only authorized such cities to provide for inspection, licenses, and regulations so as to secure conformity to the general statute. The city may enforce such regulations as are reasonable in requiring milk dealers to comply with the law.

"A city has ample power by police regulation to protect the health of its inhabitants, but a municipal police regulation cannot infringe on rights guaranteed by the Constitution or laws of the state. A municipality cannot lawfully forbid what the Legislature has expressly authorized (citing authorities) . . .

"Here clause 1 of the statute of section 11985 defines milk. It is required to be fresh, clean, and come from healthy cows, properly fed and kept. It is not denied that the product so produced and kept is wholesome. . . . It is apparent that the statute has made several classes of milk products, of which raw milk is one and pasteurized milk another. The ordinance under consideration forbids anyone to deal in raw milk, a product which the Legislature authorizes as a lawful product and which admittedly is healthful and harmless. It cannot be contended that pasteurized milk is the milk described in clause 1 of the section, because it is subjected to a process which gives it a different character. Therefore, under the rule of law as stated above, on the face of the ordinance and the statutes, the city had no authority to forbid the dealing in raw milk, and could not lawfully refuse permits to milkmen to sell it. . . . Here is a lawful product, made so by the statute of the state, and the ordinance purports to forbid a citizen his constitutional right to deal in that lawful and harmless product. This does not mean that the city may not make regulations which the statute does

not impose, conditions which insure the purity of the product. The city may require standards of *quality* in the milk dealt in, where the statute makes none. One may violate an ordinance without violating a statute. But the ordinance here is not limited to those regulations. It definitely and distinctly forbids anyone to deal in a product which the statute declares to be lawful."

The petition for mandamus was allowed.

A Connecticut case also shows the extent to which the power of the state over regulation of milk supersedes municipal action.

In *Shelton* v. *City of Shelton;* 111 Conn. 433, 150 Atl. 811 (1930), the plaintiff was a licensed milk dealer doing business in the City of Shelton. The plaintiff had complied with the laws of the state, the rules and regulations of the state milk regulation board and the ordinances of Shelton concerning the production, handling and sale of milk, except one ordinance of that city which provided, in effect, that no milk or cream should be sold at retail within the confines of the municipality unless it had been pasteurized or produced from tuberculin-tested cows.

The charter of Shelton empowered the city to adopt ordinances

> "to license milk dealers and to regulate the sale and manner of distribution of milk and to prohibit the sale thereof, unless in accordance with such regulations."

The city was further authorized, in the same section of the charter, to adopt ordinances with reference to foods

> "and to prohibit the sale thereof when in such condition as to endanger the public health."

Subsequent to the incorporation of the defendant municipality, the General Assembly of Connecticut enacted certain legislation concerning the inspection of dairies and the production, care, handling, marketing and sale of milk and cream and gave the milk regulation board power to make rules and regulations concerning the marketing or sale of milk or cream within the state "to protect the public from the use of milk and cream which is unsanitary or detrimental to public health." The statute recognized five types of milk and made all five lawful provided the statutory regulations were complied with in their production and sale. In addition to pasteurized milk and milk from tuberculin-tested cows, the statute defined and recognized raw milk, grade A milk and certified milk.

A "saving-clause" in the Act provided:

> "No provisions of sections 2485 to 2492 inclusive shall affect the authority of any town, city or borough to enact ordinances or by-laws for the control, regulation, sale or distribution, within its limits, of milk which may be detrimental to public health."

The Supreme Court of Errors of Connecticut, despite the saving clause, found that the ordinance, in forbidding the sale of raw milk, grade A milk and certified milk, each of which was recognized by the statute as a lawful product, was in conflict with the statute and for that reason void. The court, after pointing out that ordinances must not conflict with statutes and must be in harmony with the general law of the state and with its public policy as expressed in its legislation, said (p. 815 of 150 Atl.):

> "Obviously there is nothing in section 2491 [the 'saving clause'] or in section 1 of Chapter 272 of Public Acts of 1929 which gives the city of Shelton the right to prohibit the sale of milk or cream unless it be produced from tuberculin-tested cows or

pasteurized. There is nothing in the section which grants to this city the right to prohibit the sale of raw milk which meets the statutory qualifications, by a producer or dealer who has complied with every provision of the law."

And continuing the court said (p. 816 of 150 Atl.):

" . . . The ordinance converts the permissive use of tuberculin-tested milk or pasteurized milk of the statute into a compulsory one. It prohibits absolutely the sale and hence the use of raw milk, whose use and sale the statute grants conditioned upon compliance with the statutory requirements. The ordinance repeals this statutory grant within the limits of this city. The passage of this ordinance was beyond the powers granted this city.

"The statutes as amended have covered the field of milk legislation, at least so far as the General Assembly purposed, up to the time of the passage of this ordinance. The subject-matter is not an exclusively local condition. To the extent the state legislation has gone, it has pre-empted the field. The defendant under its general grant in section 66 can aid the purposes of this legislation. It cannot override it. It cannot prohibit what the statute grants. It cannot set up new standards in place of the legislative standards. It cannot substitute its judgment for the legislative judgment. It cannot overturn a public policy evidenced in long-continued legislation over a subject state wide in its range and not only intended to conserve the health of people but certainly doing it. . . .

"The statute law recognizes at least five kinds of milk and makes all five lawful provided the statutory provisions are complied with in their production and sale, viz: Raw milk, tuberculin-tested milk, pasteurized milk, grade A milk, and certified milk. The city of Shelton was without power to enact an ordinance prohibiting the sale at retail of any one of these kinds of milk which are authorized by statute. Whether the city could in the exercise of its police power add to these regulatory provisions we have no need to inquire."

The interpretation of the "saving clause" of the Illinois statute by the petitioners is subject to the criticism that it would lead to an unseemly conflict of jurisdiction between the State and the City.

The Illinois Pasteurization Act cannot mean that specific matters shall be subject to determination by both the state and by the city at one and the same time. That would mean chaos in regulation which is not to be attributed to the intention of the legislature and which can be avoided by holding that the City's power is withdrawn by implication in the field actually occupied by the State of Illinois.

In *Village of Atwood* v. *Cincinnati, Indianapolis & W. R. Co.*, 316 Ill. 425 (1925), the question was whether the Public Utilities Act of Illinois repealed by implication the power long before granted to municipalities to require watchmen at railway crossings. The Illinois Supreme Court recognized the rule that "the police power is an attribute of sovereignty and is primarily vested in the General Assembly, which has the right at any time to recall it from the agency to which it has been delegated, and after being recalled to retain it or to confer it upon some other agency or government." (p. 433.)

After finding (p. 430) that the Public Utilities Act gave the Commission the power to require railroads to station flagman at grade crossings, the court held (p. 431):

> "If both the commission and the village authorities can exercise the power, their requirements with reference to the same crossing may be utterly contradictory, for the village board may direct the stationing of a flagman while the commission may order a separation of grades. Obviously, in such cases both cannot be obeyed, and concurrent authority often leads to conflict and results in confusion. The Pub-

lic Utilities act enjoins obedience to the commission's orders. That act is the later one and covers the whole subject of promoting the safety of the public at the intersections of streets and railroads. It is complete in itself and evidently was intended by the General Assembly to supersede the power conferred by subsection 27 of section 1 of article 5 of the general Cities and Villages act to require railroad companies to keep flagmen at street crossings."

The court held that the Public Utilities Act and the power of the village were so clearly inconsistent that both could not stand and that therefore the power of the village was withdrawn and transferred to the Commerce Commission.

It is true that the question in that case was whether there was a repeal by implication of the powers granted to municipalities but what the court said about the conflict of concurrent jurisdiction and about the desirability of avoiding such conflict is very appropriate to the case at bar. The city has argued, and properly so, that Section 19 of the Milk Act is a saving clause not present in the Public Utilities Act. We concede that except to the extent that the state by and pursuant to the 1939 Milk Act occupies the field of milk regulation, the powers of the City of Chicago are unimpaired.

Again, in *Northern Trust Co.* v. *Chicago Rys. Co.*, 318 Ill. 402 (1925), already referred to, where the question was whether the City of Chicago retained its power to require street cars to maintain brightly lighted headlights, the court said (p. 410):

"Did the Public Utilities Act of 1913, which conferred this ample control and supervision over public utilities, including street railroads, deprive municipalities organized under the general Cities and Villages act of the power to pass ordinances requiring street railroads to equip their cars with brightly

> lighted headlights? If both the commission and the city could exercise the same power at the same time with reference to the same subject matter their requirements in respect to the same utility might be utterly contradictory. In such cases the utility could not obey both the commission and the city council. Yet the Public Utilities act enjoined obedience to the commission's orders and prescribed severe penalties for failures to comply. Obviously, concurrent authority would lead to conflict and confusion."

Here, again, the question was whether the conflict between the Cities and Villages Act and the Public Utilities Act was so complete as to indicate that the latter had repealed the former, but the reasoning of the court supports our contention that where the legislature has withdrawn a portion of the city's power and conferred it on a new agency (in our case, the Director of the Department of Health of the State of Illinois) at least to the extent of any conflict between the state and municipal authorities the state governs.

The question may be asked why Section 19 was inserted if conflicts between the State Department of Health and municipalities are to be decided in favor of the state authority. We believe that we have already properly stated the purposes of Section 19, that it was intended to prevent a repeal of all municipal power by implication and to indicate that the Milk Act should supersede the power of municipalities only to the extent that the state had entered the field of milk regulation.

Petitioners contend (Brief, pp. 29-30) that if there is need for both city and state regulations there are *bound to be differences* between them. They instance the failure of the state statute to *require* the date on which the milk is to be sold to be placed on the label. They argue from this that the statute permits the use of undated containers

and *approves* their use so that if our contention be correct the city ordinance prohibiting the use of undated containers is invalid. We make no such contention and the petitioners' argument shows an unwillingness on their part to admit that there is a clear distinction between *supplemental regulations* and *prohibitions*. There is nothing *inconsistent* between the requirement of the state statute that the word "pasteurized" and the name and postoffice address of the pasteurization plant be placed on the label and the city requirement that the permit number of the Chicago Board of Health and the last date on which the contents are to be sold shall be placed on the label (R. 37).

What is actually done is that the information required by both the statute and the ordinance is placed on the label and there is nothing whatever inconsistent in the two requirements. The example given by the petitioners is not comparable to the situation here in which petitioners attempt to prohibit what the state statute recognizes and permits. An analogous instance would occur, however, if the city attempted to forbid the placing of the postoffice address of the pasteurization plant on the label by prescribing a different form of label and making it exclusive.

The failure of the state statute to require that containers be dated is neither an express nor implied approval of undated containers. The references in the statute to single service containers are, however, a definite recognition and approval of them. Furthermore, the grant of power to the Director of Public Health of the state to approve the mechanical equipment for the packaging of milk (Section 15, Item 18 of the 1939 Pasteurization Act, Petitioners' Brief, p. 86) and the Director's specific approval, as agent of the state legislature, of the

plaintiff's equipment for the packaging of milk in single-service containers makes the prohibitory ordinance of Chicago not simply regulatory or supplementary to the state action, but directly in conflict with it.

The Circuit Court of Appeals correctly held:

> "Neither do we agree with defendants' argument that the prohibition of plaintiff's single service container is a mere regulation."

As part of the record in the present case there has been printed (R. 23-122) the milk ordinance of the City of Chicago passed January 4, 1935, the rules and regulations of the Chicago Board of Health, and certain resolutions by the Board of Health. A comparison of the provisions of the ordinance, and particularly the rules and regulations of the Board of Health, with the 1939 Milk Act passed by the legislature, will indicate to what greater extent than the state statute the Chicago city ordinance goes. It provides for licenses both of sellers and their vehicles (R. 33, R. 34), for the display of the license emblem on each vehicle (R. 36), for the revocation of the license (R. 37), for the labeling and placarding of all bottles, cans, packages, and other containers enclosing milk or any milk product (R. 37), for the inspection of dairy farms (R. 39), for the examination of samples (R. 40), and the permissible "plate counts" for bacteria (R. 44), none of which subjects is covered by the state statute. It is obvious that the intention of Section 19 was to preserve to the City the right to continue the ordinances and regulations on those subjects not occupied by the state system of supervision.

The next, and, we think, determinative question, is whether in fact, the state of Illinois has occupied the field of approving types of containers so that any action of the City of Chicago in conflict therewith is void.

We submit that the state has by the Milk Pasteurization Act of 1939 given its approval to paper containers (termed in the Act single-service containers, but at the present time the only single-service containers in commercial use are paper.) As has been seen, Section 4 of the state statute provides for the issuance of a certificate of approval to a pasteurization plant after inspection "if the plant, equipment and methods of operation" are found to comply with the provisions of the Act. It is admitted by the answer (R. 20) that the respondent's plant is at Chemung, McHenry County, Illinois, and the evidence is uncontradicted that respondent is equipped only for the bottling of milk in Pure-Pak paper containers on two machines leased from the Ex-Cell-O Corporation, and the respondent does not have facilities to bottle milk in glass containers (R. 890).

An integral part of its "method of operation," approved by the State of Illinois (R. 695-696) is the packaging of milk in these paper containers. That the method of packaging milk is just as much a part of the method of operation which the Director of the Department of Health of the State of Illinois approved, is clearly indicated by the requirements of Section 8 that all pasteurized milk shall be placed in final delivery containers in the plant in which pasteurized and the provision of Section 15, Item 18, that "bottling or packaging of milk and milk products shall be done at the place of pasteurization *by approved mechanical equipment.*"

The Ex-Cell-O Pure-Pak machine, pictures of which are rather poorly re-produced in the printed record (R. 1469, R. 1498-1501) is equipment adapted solely to the packaging of milk in Pure-Pak paper bottles by means of a mechanical operation whereby that part of the paper bottle coming in contact with the milk is not touched by

human hands at the dairy and before being filled with milk is immersed in a hot paraffin bath, then cooled in the refrigeration unit, and automatically filled, sealed and stapled.

Section 16 (a) of the state statute gives the Department the right to suspend its certificate of approval because of unsanitary conditions of "*milk containers* or equipment." This clearly shows supervision by the State of Illinois of the pasteurization plant, the method of doing business, the equipment, and milk containers, and is an occupation of that field, at least with respect to the approval of the type of container, to the exclusion of the City.

Lest the failure of the Circuit Court of Appeals to cite the case of *City of Rockford* v. *Hey*, 366 Ill. 526 (1937), although called to the attention of that court, be treated as a waiver by us of the applicability of that case, we here expressly rely on it. See our discussion above (pp. 19-21). There the City of Rockford had no power to prohibit the sale of ice cream *in Rockford* by requiring a license and an inspection of a plant outside the city; here the City of Chicago cannot prohibit the sale of milk *in Chicago* by rejecting containers and the corresponding plant equipment which the state has approved outside the city.

We have shown above repeated references in the statute, and the state rules and regulations promulgated pursuant to it, recognizing paper containers, and in view of the approval by the State of Illinois, pursuant to the state statute, of both the pasteurization plant and the method of operation, namely the use of paper containers instead of glass containers, we insist that the State of Illinois has withdrawn from the City of Chicago the right to prohibit (as distinguished from regulate) paper bottles. On

one hand the state approves the pasteurization plant and the type of container and makes it illegal to sell milk in any way except in that container and on the other hand the City of Chicago steps in and says you may not sell in that type of container. The City is not attempting to *regulate* the container approved by the state, but to *prohibit* it, and the decisive question under this heading of our brief is whether a creature of the state, such as the City of Chicago, may challenge the approval by the parent state made pursuant to state law, of a method of operation recognized as entirely lawful by, although not required by, the statute.

We think, under the cases already cited under this heading, the answer is obvious.

Those cases hold clearly that in instances of conflict between state authority and municipal authority, the latter must give away, and we can think of no sharper conflict than the present instance in which the state approves and the city attempts to forbid.

We may ask whether in this particular case an application of this rule will lead to justice or injustice. We submit that it will clearly lead to justice. In this case we have the City of Chicago aligning the *supposed* judgment of fifty aldermen rendered in the year 1935, at a time when these containers were not widely known (and were not used in Chicago or its environs) against the Board of Health of the City of Chicago acting in 1939, the General Assembly of the State of Illinois, (which recognized single-service containers as proper in the 1939 Act), the Director of the Department of Health of the State of Illinois (who has approved the respondent's plant and its method of operation), the United States Public Health Service (which has amended its model ordinance expressly to permit single-service containers), and the practical experience of hundreds of other municipalities.

II.

State Approval of Single Service Containers Is Conclusive that Prohibition of Such Containers by a Municipality Is Unreasonable as a Matter of Fact.

Another line of reasoning leads to the conclusion that the ordinance of the City of Chicago, if construed to prohibit the use of respondent's Pure-Pak bottles, is invalid. Under the law of the State of Illinois, an unreasonable ordinance is void and the question of unreasonableness is a judicial question. This point is not to be confused with a question of constitutionality (*City of Lake View* v. *Tate*, 130 Ill. 247 (1889) at page 252).

In *Chicago and Alton Railroad Co.* v. *City of Carlinville*, 200 Ill. 314 (1902) involving the validity of an ordinance regulating speed of trains, the court said (p. 321):

> "The rule adopted in this State is, that where the ordinance is passed in pursuance of power expressly conferred by the legislature and the details of such municipal legislation are prescribed by the legislature, an ordinance passed in pursuance of such power cannot be held invalid by the courts as being unreasonable; but when the details of such legislation are not prescribed, an ordinance passed in pursuance of such power must be a reasonable exercise thereof or it will be pronounced invalid. (Citing Authorities) It is said in the *Tate* case, on page 242: 'Where the power to legislate on a given subject is conferred and the mode of its exercise is not prescribed, then the ordinance passed in pursuance thereof must be a reasonable exercise of the power or it will be pronounced invalid.' In *Hawes* v. *City of Chicago*, *supra*, Mr. Justice Baker, in speaking for the court, in discussing the question when a court may rightfully hold an ordinance unreasonable, on page 658 said: 'Where the power to legislate on a given subject is conferred on a municipal corporation, yet if the

details of such legislation are not prescribed by the legislature, there the ordinance passed in pursuance of such power must be a reasonable exercise thereof or it will be pronounced invalid.'"

In *Koy* v. *City of Chicago*, 263 Ill. 122, the court said (p. 127):

"When the legislature has authorized a city council to pass ordinances upon any subject, the power thus conferred must be reasonably exercised. Whether its exercise in a particular case is reasonable is a judicial question, and an unreasonable ordinance will be held void by the courts."

In *City of Chicago* v. *Chicago & North Western Ry. Co.*, 275 Ill. 30 (1916), holding certain provisions of the Chicago Milk ordinance invalid, the court said (p. 38):

"An unreasonable ordinance will be held void by the courts."

The fact that in this case the power of the city concerns a matter of public health does not enlarge its powers.

In *People* v. *Robertson*, 302 Ill. 422 (1922), which determined that the City of Chicago had no power without establishing a board of health, to delegate to the commissioner of health power to promulgate rules to prevent contagious diseases, it was held (p. 432):

"While the powers given to the health authorities are broad and far-reaching they are not without their limitations. As we have said, while the courts will not pass upon the wisdom of the means adopted to restrict and suppress the spread of contagious and infectious diseases, they will interfere if the regulations are arbitrary and unreasonable."

This case also laid down a rule peculiarly applicable to the facts existing in the present case (p. 434):

"One of the important elements in the administration of health and quarantine regulations is a full measure of common sense."

In the very recent case of *City of Mt. Vernon* v. *Julian*, 369 Ill. 447 (1938) dealing with a Sunday closing ordinance, the court, after saying that city councils exercise only delegated and limited powers and that the power to pass an ordinance must be delegated in express terms or be necessarily incidental to an express grant and not simply convenient, stated (p. 449):

> "When the power to legislate on a given subject is conferred and the mode of its exercise is not prescribed in the charter, an ordinance passed pursuant thereto must be a reasonable exercise of that power. *City of Lake View* v. *Tate*, 130 Ill. 247, and authorities therein cited."

These cases go on the well-established rule that the grant of power by the state legislature to a municipality is a grant of power to pass reasonable ordinances and only reasonable ordinances. It is not necessary, in order to prove such an ordinance void, to prove that it is unconstitutional, and so the rule in Illinois is much more favorable to judicial review of municipal action than that of other jurisdictions.

The question before the Court is whether, under existing circumstances, the city should be permitted to enforce its ordinance, assuming that it is to be construed as prohibiting paper containers. The question of its reasonableness must be viewed today, because, as stated in *Northern Trust Co.* v. *Chicago Rys. Co.*, 318 Ill. 402 (1925), (p. 412):

> "The power to enforce proceeds from the present or existing power or authority to enact or to provide. A municipality cannot be said to possess the power to enforce an ordinance concerning a subject upon which it has lost the power to pass the ordinance."

Assuming, therefore, as is contended by the city, that Section 19 of the Milk Pasteurization Act preserves to the

city the right to pass ordinances on the question of milk containers, the preservation of that right is a right to pass or to enforce only a reasonable ordinance on that subject, in view of today's conditions. Since the public policy of the state is that which is declared by the General Assembly, and since the General Assembly and state officers acting under its authority have declared single-service containers proper milk containers, it is palpably unreasonable for the city to attempt to enforce an ordinance absolutely prohibiting them.

The state having declared its policy that single service containers are proper does not mean necessarily that the city has been deprived of the power to regulate them, but we are not talking here of regulation, but of prohibition—a prohibition by a child of the act of its parent, by a ward of the act of its guardian, by a creature of the act of its creator, and by an inferior of the act of its superior. We rely, as indicating the unreasonableness of the enforcement of the Chicago ordinance at this particular time, on all of the cases which we have cited under the preceding point which indicate that the ordinances of a municipality may not violate or be inconsistent with the public policy of the State as declared by the General Assembly—see particularly the quotations set forth above from the following cases:

City of Chicago v. *Union Ice Cream Mfg. Co.*, 252 Ill. 311 (1911).

City of Marengo v. *Rowland*, 263 Ill. 531 (1914).

City of Lewistown v. *Harrison*, 282 Ill. 461 (1918).

We submit that as a simple question of fact—whether or not the prohibition of single-service containers is a reasonable prohibition—the decision must be against the ordinance in view of the approval of this type of container by the sovereign.

It cannot be supposed that the General Assembly of the State of Illinois would approve single-service containers if they presented a health hazard. Its recognition of single-service containers is a declaration by the state that that *type of container* is a proper one. Still bearing in mind that we are not complaining of some *regulation* relating to single-service containers, we contend that under *People* v. *Carolene Products Co.*, 345 Ill. 166 (1931) the enforcement of the ordinance *prohibiting* single-service containers is unconstitutional under the law of Illinois, because not even the legislature has any authority to pronounce the performance of an innocent act criminal. In that case the court said (p. 168):

> "The legislature has no authority to pronounce the performance of an innocent act criminal when the public health, safety, comfort or welfare is not interfered with, (*Gillespie* v. *People*, 188 Ill. 176) and may not, under the guise of protecting the public interests, arbitrarily interfere with private business or impose unusual and unnecessary restrictions upon lawful occupations (citing authorities). No question of imitation or fraud is involved in this case and the wholesomeness of carolene is admitted. In *People* v. *Price*, 257 Ill. 587, this court said: 'It may be conceded the legislature has no authority to forbid the sale of a known wholesome article of food.'"

We paraphrase this and submit that the City of Chicago has no legal right to *forbid* the use of a *type* of milk container which the supreme legislative authority of this state has permitted and approved and declared safe and sanitary.

We contend that this is one of the important questions in this case, namely, whether a city which permits the sale of milk and cream at retail in glass bottles has any right to prohibit the sale of milk and cream in paper containers approved by the state legislature and the

state officials; and especially when said container is not shown by a scintilla of evidence or by any experience to be a hazard to public health. We respectfully contend that the Illinois legislature is the paramount authority in expressing the public health policy in this state and that it is unreasonable as a matter of fact for its creature, the City of Chicago, to refuse to recognize and approve that which its creator has approved.

In claiming that the approval of single service containers by the state legislature does not preclude the City of Chicago from prohibiting them, the city relies entirely upon the language of the saving clause in the 1939 statute.

It says that if the city had the power prior to the passage of the statute to prohibit paper milk bottles it must now continue to have that power or the statute will be either "impairing" or "abridging" the power of the city, contrary to the language of the saving clause. Prior to the passage of the 1939 act, the present suit was filed challenging the power of the city to prohibit paper containers, so that the city's assumption that it had such power prior to the passage of the statute is highly debatable and vigorously contested.

But in the midst of this controversy the state legislature of Illinois sanctioned the use of single service containers. If any single one of the highly imaginary fears (pp. 40-69) that the petitioners argue in this Court the City Council of the City of Chicago might consider in excluding paper containers were in any respect real, the state legislature never would have approved single service containers. As already pointed out, under Illinois law not even the legislature of the state has any authority to prohibit the sale of wholesome articles (*People* v. *Caro-*

lene Products Co., 345 Ill. 166 [1931],) and it follows that the City of Chicago itself has no such right.

In the absence of a legislative determination by the General Assembly of the State of Illinois that single service containers were proper containers, it might well be that the presumption of reasonableness would attach to an ordinance of the City of Chicago prohibiting them, but the moment that the state legislature has made its determination then certainly a subordinate legislative body such as the City Council of the City of Chicago is not acting reasonably in ordaining that what the state legislature has found to be wholesome is, in fact, unwholesome, and if the presumption of legislative correctness is to be carried to the limits urged by the petitioners *the presumption should be applied to the sovereign of the state speaking through the General Assembly rather than to the City Council of the City of Chicago.*

Accepting the determination by the General Assembly of the reasonableness of the use of single service containers is not impairing or abridging the power of the City of Chicago for its power never exceeded the power to pass reasonable ordinances. We have already pointed out that under the Illinois law the grant of power by the legislature to the city council is a grant of power to pass reasonable ordinances only.

While admitting (Petitioners' Brief, pp. 69-70) that, in fact, the city council did not have in mind in 1935 any of the items enumerated by the master (R. 1734-1735) upon which "the legislative body may reasonably base its decision", petitioners say (p. 70):

> "Since the question of reasonableness is determined in the light of conditions existing today, we are not concerned here with what the City Council actually did consider before it enacted the ordinance,

but with what it might reasonably have considered assuming conditions to have been as they are today or, rather, with what it might reasonably consider today in the light of today's conditions."

One of today's conditions is the determination by the General Assembly of the State of Illinois in 1939 that there was no danger from single service containers which prevented the legislature from recognizing them as proper containers.

To summarize, the power which the City of Chicago has is the power to pass reasonable ordinances. This arises not out of any constitutional question at all but out of Illinois law which says that the grant of power to a subordinate legislative body by the General Assembly is a grant of power only to pass reasonable ordinances and that the determination of reasonableness is for the judiciary. What might be presumed to be reasonable in 1935 admittedly may not be reasonable today. When the state legislature in 1939 recognized single service containers as proper containers it declared as a matter of state policy that none of the fears about paper containers now expressed by the city had any merit. The presumption of correctness arising from this determination by the state legislature of Illinois overcomes any theoretical presumption of reasonableness attaching to the determination in 1935 by the Chicago City Council that single service containers should be prohibited.

Giving this effect to state action does not "impair" or "abridge" the power of the city. Before the state statute was enacted the city had the power to pass only reasonable ordinances; after the state statute was enacted the city had the power to pass only reasonable ordinances. But in determining the reasonableness of an ordinance which the city now seeks to enforce, the superior deter-

mination of the General Assembly of the state that single service containers may reasonably be used destroys any presumption of legislative correctness in the contrary holding by the Chicago City Council.

Without impairing the power of the City of Chicago, the determination by the state legislature is the determination of the unreasonableness of the attempted enforcement of the city's ordinance which in any court supersedes the presumption of correctness which otherwise might attach to the city's action.

It was undoubtedly this which the Circuit Court of Appeals had in mind when it said:

> "The authorities are uniform that any ordinance which conflicts with any statute *or public policy* adopted by the State Legislature is invalid." (Italics ours.)

and also when it said:

> "The defendants' contention, if sustained, would give the city a broader power than that provided by the Legislature for the state. It would make the state subservient to the city. It would impute to the Legislature the purpose of withdrawing the power theretofore exercised by the city and by the saving clause reconferring such power. We are unable to believe that such an incongruous result was intended."

The approval by the state of single service containers constitutes the best guide for the courts in determining whether as a question of fact the ordinance of the City of Chicago when sought to be enforced in 1939, under conditions existing in 1939 was any longer a reasonable ordinance.

The judgment of the Circuit Court of Appeals should be affirmed.

III.

The Ordinance Is Unreasonable as a Matter of Fact.

[Answering Petitioners' Point II, pp. 34-79.]

Petitioners cite very few Illinois cases on the question of unreasonableness of ordinances even though that question is one strictly of local law. In so far as the Fourteenth Amendment to the Federal Constitution is concerned, the decisions of this Court are, of course, controlling, but in determining whether the ordinance is reasonable under Illinois law, the decisions of the Illinois Supreme Court are controlling.

We have pointed out under the preceding point the Illinois cases holding that there is a distinction in Illinois between unconstitutionality of an ordinance and unreasonableness. The following cases hold that where a general grant of power is made to a city without the details being prescribed by the legislature, an ordinance passed in pursuance of such power must be a reasonable exercise thereof or it will be pronounced invalid:

Chicago & Alton R. R. Co. v. *City of Carlinville*, 200 Ill. 314 (1902) and cases therein cited;

City of Mount Vernon v. *Julian*, 369 Ill. 447, at p. 449 (1938).

We have pointed out under Point II that if due regard is to be given to the legislative determination by the highest legislative body in the State of Illinois, the ordinance passed and sought to be enforced by a subordinate municipality cannot be sustained. In addition, we submit that the evidence in this record and matters of public notoriety, of which the courts should take judicial notice, abundantly and conclusively show in the language of *Koy*

v. *City of Chicago*, 263 Ill. 122 (1914) that the prohibition of paper containers "is so clearly and manifestly wrong that there can be no doubt about it". The rule that an ordinance or any other legislative act is presumed to be valid arises from the fact that the judicial branch of the government must recognize the right of a coordinate branch, the legislative, to determine facts for itself, so that on a merely debatable question the court will not substitute its own judgment for that of the legislative body.

Viewing the present situation realistically, it is fanciful to attribute any actual legislative determination on the question of paper bottles to the City Council of the City of Chicago when, as the *Circuit Court of Appeals* said (R. 1787), that subject was not in their minds at all in 1935. It is a far stretch of the imagination, therefore, to consider the question at bar as having received any legislative determination by the City Council in 1935; and in view of the facts in the record showing that the Board of Health of the City of Chicago made no effort whatever to ascertain the sanitary properties of single-service containers until almost a week after this suit was filed (R. 1003), it is also difficult to see where any real administrative determination was made. The petitioners' plea for attributing correctness to the legislative determination is wholly technical.

Legislatures and city councils in the exercise of the police power may, of course, prohibit all things harmful to health and to the safety and general welfare of society even though the prohibition invades the liberty or property of an individual, but when the articles or things prohibited do not injure the public health or the safety of society, all reason for the prohibition is absent and the

prohibition is not justified, and clearly amounts to confiscation of property and deprivation of liberty in violation of Section 2, Article II of the Illinois Constitution.

Under the laws of the State of Illinois the legislature has no right to prohibit the sale of a known, wholesome article of food and the same consideration would preclude a prohibition of a known, harmless, modern container for milk.

People v. *Carolene Products Co.*, 345 Ill. 166 (1931);

Carolene Products Co. v. *MacLaughlin*, 365 Ill. 62 (1936);

People v. *Price*, 257 Ill. 587 (1913).

In contending that the ordinance is both unreasonable and unconstitutional, we do not overlook the rule of law that innocent acts may sometimes be prohibited where necessary to abate an evil which is a proper subject of the police power. This is not such a case. The evil intended to be remedied by this ordinance is briefly and very clearly stated in the "Public Health Reasons" explaining the purpose of Section 3094 as follows (R. 109):

> "The use of standard milk bottles for delivering milk and milk products in quantities less than one gallon is required in order to prohibit delivery in such containers as buckets, fruit jars, etc., which may be difficult to wash and to subject to adequate bactericidal treatment, which cannot be filled and capped with the proper equipment used for these purposes, and which it is often difficult to label properly."

Conceding for the purpose of this point the right of the City to require liquid milk and cream to be sold in containers, we deny the right of the City to prohibit the use of a container which is not within the object of this section of the ordinance; and which though modern, por-

motes public health and proper sanitation as effectively as the commonly accepted and officially approved containers and which does not lend itself to any of the evils which the City has the power to stamp out.

We submit that the action of the petitioners is arbitrary and unreasonable. Succinctly stated, respondent is denied the right to use its paper milk container to compete with dairies using the out-moded and much abused glass milk bottle. This restriction fosters monopoly rather than protects against it. The restriction discourages competition rather than encourages it. The result of the supposed regulation is not to "regulate" the sale of milk in paper containers, but to prohibit it and actually to preclude persons from engaging in the milk industry in competition with glass bottle dairies.

The evidence shows, as the trial court correctly found (R. 1752) that the use of the paper container creates "no new or unusual health hazard," and "that they are safe and sanitary containers in which milk may be delivered."

The trial court held in substance that in matters affecting public health the law should adopt the best scientific thought of the age. When research and investigation, coupled with vast experience, justify the adoption of new methods without prejudice to public health, it should unhesitatingly be done. Were the rule otherwise, progress would be stifled (R. 1755).

In considering the reasonableness of the ordinance of the City of Chicago as a question of fact we first, of course, have pointed to the approval of single service containers by the state legislature. Next we point to the approval of Pure-Pak paper milk bottles and of the respondent's pasteurization plant by the Department of

Health of the State of Illinois, a fact which is disclosed by the stipulated testimony of Mr. S. V. Layson, Milk Sanitarian of the Department of Public Health of the State of Illinois with offices at Springfield (R. 695). While the court may decide that as a *matter of law* the State Department of Health has no jurisdiction to *compel* the petitioners to permit the use of single-service containers in the City of Chicago, the fact is undisputed that the Department of Public Health of the State of Illinois has approved the Pure-Pak, single service container, and that fact cannot be overlooked in determining whether the action of the City of Chicago, in undertaking to prohibit it is unreasonable or is necessary to protect public health.

In determining whether the petitioners are acting reasonably the Court should also take into consideration the fact that the United States Public Health Service, under the supervision of Dr. Thomas Parran, has approved paper milk containers (R. 1661, 1678, 1699-1704). Concededly, the United States Public Health Service has no plenary jurisdiction in the City of Chicago, but it is admitted by the petitioners that its standards are considered high and are considered safe, so the action of the United States Public Health Service may not be overlooked in determining whether the City of Chicago is acting reasonably in excluding single service containers (Arnold, R. 1165).

The record shows that the Board of Health of the City of Chicago has approved single service containers under the standards laid down by the United States Public Health Service and has recommended an amendment in the ordinance here challenged to permit the sale of milk in single service containers (Bundesen, R. 1211; R. 1698-1704). It is true that the Board of Health has no power

to change an ordinance and that its recommendation is not binding either upon the petitioners or upon the Court, but in determining whether the petitioners are acting reasonably in excluding single service containers, the action of the Chicago Board of Health cannot be overlooked.

Next, in determining whether the City of Chicago is acting reasonably, weight must be given to the experience of other cities where the use of single service containers has been permitted and where there is not the slightest suspicion that they have created or tended to create any health hazard. We are here not referring to the fact that the municipalities which have permitted the use of Pure-Pak containers are great in number on the theory of counting noses (as the petitioners seem to think) but that the favorable results of the use of the container in those municipalities may not be overlooked in deciding whether the City of Chicago is acting reasonably in the present case. (Furthermore, this evidence was admissible to show how widespread was the use of these paper bottles to prove that they were standard bottles.)

The evidence proves that respondent is and has been engaged in the sale of wholesome milk and milk products in the State of Illinois and sells its products in these containers in suburban communities in Cook, DuPage and Lake Counties without interference. This had been done daily for almost two years before the trial court's decision with no consequent injury to public health. These experiences were persuasive to the trial court; and obviously, if these experiences in the use of paper containers had disclosed any health hazards, petitioners most certainly would have presented proof of this fact by competent evidence, and not relied on mere theory and conjecture.

We contend that it can be safely and logically assumed that the milk consumers in Evanston, Winnetka and Oak Park and sixty-five other communities in and about Chicago are no less susceptible to disease than are the residents of Chicago. There is nothing peculiar about these milk consumers which distinguishes them from Chicago citizens. This argument applies with equal force to the residents and milk consumers in Washington, Detroit, New York City, Boston and Philadelphia and hundreds of other cities and villages which use paper containers daily. Geographical location does not result in new and peculiar health hazards reasonably related to milk containers.

No reason is advanced, and no evidence was offered, to sustain the theory of the city that peculiar local conditions exist in the City of Chicago which prevent the court from considering the satisfactory experience of hundreds of other communities in using paper milk bottles. Millions of quarts of milk in paper bottles are being sold daily in Illinois and to army camps throughout the United States (12,000 quarts daily are sold to Camp Grant, Rockford, Illinois, by respondent), without suggestion of ill-effect.

That the city has no real fear of the evils which it argues the city council might consider in prohibiting paper milk containers is proved by the fact that since the date of the decision of this case by the District Court, October 18, 1940, the city has permitted millions of paper containers which are not protected by any injunction of any court—state or Federal—to be used freely in the City of Chicago. No harm has resulted from the use of such other containers or from the distribution of milk in plaintiff's containers under the protection of the present injunction and the fact that the petitioners

have voluntarily permitted the use of these other containers is eloquent proof that petitioners well know that no public health hazard is actually involved.

Another fact which ought not to be overlooked in deciding whether the prohibition of paper milk containers is reasonable, is the universal use of paper containers daily for liquid foods of all types. The point here is not that the articles and uses are so similar that the City may not permit one without the other, but that the widespread use of paper containers stamps as unreasonable when treated as a matter of fact and not as a matter of law, the action of the petitioners in prohibiting paper milk containers.

The City stipulated that it permits the use of single-service paper containers for liquid coffee, soft drinks, and ice cream sold by drug stores and restaurants without restriction, inspection or regulation (R. 694). This is an administrative decision which proves that they are not a health hazard. Such containers are related to the public health of the inhabitants of the city and are used daily by practically all citizens of the city in consuming food and drink. Infants, the aged and convalescents are permitted to partake of ice cream dispensed in paper containers over which the Board of Health exercises no supervision.

Fiber-board pails, ice cream cartons, drinking cups, tall paper tumblers and other articles of paper too numerous to mention which are much more lightly paraffined than are Pure-Pak containers have been used for years and are still being used in Chicago without inspection and, most significant of all, with the acceptance by the common man that there is nothing more sanitary than a single-service paper container.

It was stipulated that paper containers were permitted without objection by the Board of Health and without

any test to determine the sanitary quality of the paper used for the sale of ice cream, butter, lard, cottage cheese, other kinds of cheese, oysters, pickles, soft drinks and liquid coffee; that ice cream is sold in metal cans with a thin paraffined paper liner between the ice cream and the container; that paraffined paper is permitted to be placed across the top of metal milk cans underneath the metal cover of such cans; that paraffined drinking cups and paraffined paper straws are used in the City of Chicago, and that paraffined paper liners for dishes in which ice cream is served are also used, all without objection or regulation by the Board of Health (Stipulation, R. 694).

The common man's acceptance as a truism that paper containers are sanitary is a better guide to the truth than are learned theories of the experts, real or pretended. It leads inevitably to the conclusion that paper milk containers are sanitary. The trial court considered all of this evidence and came to the conclusion that no health hazard was presented.

Lastly, in determining whether the City of Chicago is acting reasonably, we think the Court should give careful consideration to the evidence before it in this case proving that the single service container in question has not at any place or at any time been even suspected of constituting a health hazard.

We now turn to the specific arguments advanced by the city in support of its theory that the prohibition of paper containers is reasonable.

Sanitation and Absorption.

[Answer to Point II-(b)-2; Petitioners' Brief, pp. 44-51.]

It is argued that paper milk bottles are rightfully prohibited because the container board absorbs a few drops of milk. It is argued by the city that this factor "is of utmost significance." (p. 48). Yet the petitioners do not point out, nor does the record show in any respect, that a public health hazard exists merely because a few drops of milk might be absorbed in the corners of a paper milk bottle. There is no evidence in the record that anyone ever became ill or infected, or was likely to become so, by reason of a few drops of milk absorbed by the paper board. No witness heard of any such experience, not even Dr. Arnold, petitioners' main expert witness. On the other hand, petitioners champion the glass bottle which the evidence and common knowledge show is used over and over by milk containers, different ones daily, many times; and which multi-used glass bottle is exposed daily on the house door-step, subject to contamination by contact with all the domestic animals about the home or neighborhood, ordinary exposure to the weather, irritants in the air, breakage and leakage, in hot or cold weather. In freezing weather it is common knowledge that the cream is expelled out of the mouth of the bottle and exposed to contamination on the door-step, window-sill, rear porch or the other usual depositories for glass milk bottles. Petitioners' argument that the absorbency of paper milk bottles is of "the utmost significance" fails because of the absence of proof that such absorbency ever caused or might cause any illness or disease. The proof of the pudding is in the eating. The argument of petitioners is based on pure theory. There is no danger in paper bottles compared to paper

caps made of the same material and permitted by the city to be used on glass milk bottles. These caps permit absorption of milk and they are taken off in common use and exposed to the bacteria and the irritants in the air and afterwards replaced on the bottle with the bacteria on the inside. This may easily contaminate the contents of the bottle. The imperfect washing process on the glass bottle and haphazard inspection of glass bottles by the petitioners (1400 bottles being inspected over a period of a year when 365,000,000 quarts of milk are sold in glass bottles in the City of Chicago) offers slight support to the petitioners' efforts to discredit the single service paper milk bottle on the absorption issue (R. 986 to 996).

If the absorbency argument now advanced by the defendants has any plausibility the Illinois Legislature adjudged it to be of slight significance.

The State of Illinois has repudiated absorbency as a reason for prohibiting paper containers, for Item 5 (e) of the minimum requirements promulgated by the Director of the Department of Health, (above, pages 28-29) provides only that "all single-service containers shall be so treated as to be as impervious to milk *as practicable*," thus recognizing the impracticability of making them entirely impervious. This policy of the state controls the action of the City of Chicago.

Dr. John W. Rice of Bucknell University, Lewisburg, Pa., found the paper bottle superior to the glass bottle in abating the spread of infectious diseases because of its high inherent sanitary quality (R. 406-7; 424). His research work and experience disclosed that the bacteria found in the paper board were not pathogenic. He never found any pathogenic bacteria on any paper board used in paper milk bottles (R. 411). In his opinion, supported by research, absorption of milk in the paper board

presented no health problem (R. 425). This witness was requested to testify by the defendants and his time and expenses were paid by the city.

Dr. John R. Sanborn of the New York State Agricultural Experiment Station, Geneva, N. Y., testified positively that the absorption item was insignificant (R. 286, 289-290) and the disintegration test furnished an index to the sanitary condition of the manufacture of paper containers. This being true, all reasonable and necessary safeguards exist in the matter of bacteriological control and thus the absorption argument loses all force.

Mr. M. J. Woodman of the Evanston, Illinois, health department, testified that in his experience disintegration tests offered adequate protection at all times and his experiments showed that the empty paper container was essentially free of bacteria in 300 to 400 tests (R. 680).

Dr. M. J. Prucha of the University of Illinois, testified that after two and one-half years of research, study and experience he found the absorption by paper caps used in glass milk bottles greater, relatively, than by Pure-Pak containers because of lighter paraffining (R. 716), but testified that even the absorption by the paper cap presented no health hazard (R. 659).

Dr. Paul H. Tracy of the University of Illinois, after two and one half years of study, experiments and experience, found that the absorption of milk into the paper board presented no health problem whatsoever (R. 510).

H. M. Packer of the Philadelphia Health Department, with years of experience in Philadelphia, where milk has been sold in paper containers for many years, found no objection to the use of the paper bottle by reason of any absorption (R. 1363, 1364).

Dr. E. H. Yunker of Philadelphia, with considerable

practical experience in the use of the paper milk bottle, was of the same opinion (R. 1387).

The City's effort to capitalize on the absorption issue finds no support from practical experience. As the case takes final form, this appears to be the chief reliance of the defendants. All the expert witnesses in this case (except Dr. Arnold) were unanimous that health authorities possessed as adequate bacteriological control over paper milk bottles as they had over glass bottles.

We respectfully submit that the City's argument on the absorption issue has no merit whatever when considered in the light of wide practical experience for years. The container has had sufficient use in hundreds of cities and villages daily so that if absorption presented any hazard to public health, the City would have readily presented such evidence. Not one witness was produced by the City to testify to any fact supporting this academic objection.

It is conceded that absorbency is material only because of fear of contamination from the milk container board, yet Dr. Arnold testified that he had never found pathogenic bacteria on milk container board (R. 1148).

Dr. Arnold also testified (R. 1165) that the model ordinance and code of the United States Public Health Service were generally considered a reasonable and safe standard for milk sanitation (R. 1165). Surely, since this service recommends the use of single-service containers and approves them in its model milk ordinance, the absorption of a few drops of milk now complained about by the City is no real detriment. The present universal recognition of the merits of single service containers in spite of some slight insignificant absorbency, and the fact that there is no suspicion that this absorbency has ever, anywhere, at any time, constituted a menace to health is a complete

answer to the City's present argument. Practical experience is more potent proof than mere speculation.

Paraffin Used on Paper Containers.

[Answer to Point II-(b)-3; Petitioner's Brief, pp. 51-53.]

The City contends that because a small particle of paraffin might get into the milk, the containers must be denied use by the City.

Dr. Robert A. Black, a member of the Chicago Board of Health, testified (R. 1226), that he knew "nothing in way of proof on either side" with regard to the sanitary aspects of the single-service container, and when asked regarding the merit or demerit of milk containing paraffin being fed to infant babies, he said he would not want infants in his care to have milk containing paraffin. He further said (R. 1228) that paraffin was, in his opinion, inert and that it was a by-product of oil. He further testified that he never read or heard of a case of a baby being fed paraffin in milk which came from single-service paper milk bottles and that feeding oil to children to secure an evacuation of the bowels, in his opinion, "does not give any bad effects" (R. 1228). He further said he never made any inquiry nor had any information with regard to this suggested health hazard nor was inquiry made in communities and from officials in places where paper milk bottles were used (R. 1225-30).

Dr. Lloyd Arnold had a theory that the "spicules" would injure the intestinal tract, but he forgot that spicules, if any existed, were dissolved in the milk, which was heated when fed to babies, and he, too, never heard or knew of a case of a baby being injured or of its intestinal tract being irritated by reason of drinking milk from paper milk bottles (R. 1113-15). This is in sum and

substance a frank presentation of the evidence offered by the City on this issue. We submit that there is nothing in this type of testimony which presents any genuine objection to the use of paper milk bottles. Conjecture and surmise do not rebut years of experience in the use of millions of paper milk bottles daily throughout hundreds of cities and villages in the United States and elsewhere. *If there were any meritorious objection to the use of paraffin on paper milk bottles, the health officials in the hundreds of cities and villages using paper milk bottles daily, including the City of Chicago at the present time, would certainly know of it and have proof of it by now;* and the City would most certainly have offered some testimony to support the objection it now makes.

Paraffin is a wholesome product, and when applied to the paper milk bottle affords additional protection to the bottle and in no manner does injury to health. The City did not produce one witness who had any real information or data to prove to the contrary.

Dr. Arnold testified that he had never heard of any child being made ill by swallowing paraffin (R. 1172) and that he never knew, heard or read of any child or aged person having spicules of paraffin in their intestinal tracts (R. 1172-1173).

It is, in fact, a matter of common knowledge that paraffin is not harmful to health. It is commonly used by the housewife on her jellies and at one time or another has probably been chewed by every school boy.

Dr. William D. McNally, for 17 years coroner's toxicologist of Cook County, Illinois, and one of the outstanding toxicologists in this section of the country, testified that paraffin is not a poison either to adults or infants, that there is nothing about its chemistry which is harmful to human health, either adult or infant, that if

the taking of paraffin were to cause disturbance to the human body that would be the type of case that would come to him professionally; that he was familiar with medical literature generally and that he knew of no instance, either in literature or from his own experience or from consultation with physicians or from any source, where bodily disturbances of any kind were attributed to or suspected of being caused by accidental or other taking of paraffin; that the witness himself had chewed paraffin and that he had seen numbers of other persons who had chewed paraffin and undoubtedly swallowed particles larger than 100 milligrams without any ill effect (R. 1262-1264). He stated that large particles of paraffin might act as an irritant to a person with an inflamed bowel, but that he could not conceive of such particles coming from a Pure-Pak container (R. 1265). Paraffin is an un-nutrient medium for bacteria (R. 1266). Bacteria do not penetrate paraffin, and this is the reason that housewives use it for jams and jellies because it prevents the bacteria and yeasts from entering them. A piece of paraffin twice the size of a kernel of wheat might be irritating, but if it was in very small particles it would not be (R. 1296).

Dr. Tracy of the University of Illinois gave similar testimony (R. 481). He stated that paraffin was used by his mother in his boyhood and that in modern times it is being used in treating all types of waxed papers, such as cheese boxes, butter boxes, milk bottle caps and drinking cups and that they used to make chewing gum out of it (R. 481-482). He testified that the chipping off of slivers of paraffin presented no health problem (R. 529-530), and that no disease had ever been traced to paraffin in the operation of the University dairy (R. 503).

Dr. Sanborn testified that in his opinion the paraffining

process is free from public health hazard, that there is nothing in the paraffin that is detrimental to the properties of Grade A milk put into a container, that in his opinion and experience it would not change the taste of the milk or cause any odor to get into the milk (R. 178). He testified that there was nothing in the oily substance of paraffin that was dangerous to health (R. 295).

Dr. Prucha testified that he tested paraffin in the paraffin bath of an Ex-Cell-O machine and could not find any bacteria. The samples were taken under usual working conditions at the plant (R. 651).

Dr. Rice testified that the paraffin presented no health hazard (R. 413) and other witnesses testified to the harmless nature of paraffin (Packer, R. 1363; Vaughn, R. 1305).

The General Assembly of the State of Illinois and the State Department of Health have approved of the use of single-service paper milk bottles which are coated with paraffin and have declared them proper.

Petitioners rely (Brief, p. 53) on the *Criminal Code*, Illinois Revised Statutes, 1939, c. 38, par. 14. It is apparent from reading the criminal statute that it has no application herein and that the remote possibility of small quantities of paraffin getting in the milk is not an adulteration denounced by that statute, because the slight possibility of minute particles or spicules of paraffin getting into milk is not an adulteration of milk. It surely cannot be said that the Illinois Legislature, in recognizing and approving paper milk bottles, and the Director of the Department of Health of Illinois and the United States Public Health Service in approving their use and providing minimum requirements for their use, would countenance any adulteration of milk.

Odors From Paraffin

[Answer to Point II-(b)-4, Petitioners' Brief, pp. 53-56.]

The brief of the petitioners states: "It is a well-known fact that milk rapidly absorbs odors to which it is exposed" (p. 53). From this they conclude that paper milk containers *may conceivably* impart odors from paraffin or from bacteria to the milk and may therefore be prohibited. It is highly significant that although the general fact of "ready absorption" is claimed, the city offered no evidence whatsoever of odors ever getting into the milk, either from paraffin (oxidized or not) or from bacteria.

Dr. Sanborn, who is quoted at length on pages 54 and 55 of the petitioners' brief, testified *affirmatively* that there was no evidence that paraffin had ever changed the taste of milk (R. 294-295). Dr. Tracy testified that one of the first tests made at the University of Illinois was to determine whether paraffined paper bottles imparted a taste to the milk and he found that the paraffined paper bottles had no effect upon the flavor of milk (R. 494) and further said that paraffin had no flavor (R. 494-497). The flavor of milk in glass bottles was changed when exposed to light (R. 494-497).

There is not one witness or a particle of evidence in this record proving or tending to prove that rancid odors or any unpleasant odors have come from paraffin used on paper milk bottles. Elaborate effort is made to support this theory of defense by referring to the testimony of Dr. Sanborn, who frankly admitted that paraffin heated at high temperature would oxidize. Dr. Sanborn did not know what these temperatures were but stated that high temperatures coupled with stale and uncleaned paraffin bath chamber for three weeks would produce "off" odors (R. 304). This proves nothing. There is no evidence

that anyone in using paper milk bottles ever experienced off odors by reason of the oxidation of paraffin.

Petitioners refuse frankly to face the facts shown by the uncontradicted testimony of the witnesses, Howard R. Peterson (R. 942-45) and Paul V. Keyser (R. 1334-1355). The latter testified that no oxidation will occur in paraffin below its melting point, which is 125° F. to 130° F. (R. 1347). As paper milk bottles are not exposed in the home or anywhere else to temperatures of from 125 degrees to 130 degrees F. oxidation could not occur after the paraffining process had been completed at the dairy.

Howard R. Peterson whose experience and experiments with paraffin used on paper containers are wholly uncontradicted and unimpeached testified that in the bottling operation paraffin at 210 degrees F. would not oxidize for twenty hours (Peterson, R. 943, 958-959). This is a higher temperature than is ever reached in the use of the Pure-Pak machine (Prucha, R. 711-712). The temperature coefficient of oxidation of paraffin is fifteen degrees, so that at 195 degrees F. the initial resistance to oxidation is forty hours; at 180 degrees F. is eighty hours and at 165 degrees F. is 160 hours (Peterson, R. 943-944). The Pure-Pak machine consumes about 30 pounds of paraffin per thousand containers (Peterson, R. 955, 957; Dean, R. 961), has a capacity of 110 pounds of paraffin wax (Dean, R. 960), and coats between 1500 to 2000 containers per hour (Dean, R. 960; Peterson, R. 947) and the factor of safety against oxidation is from 400% to 500% (Peterson, R. 944-945).

It is undisputed that oxidized paraffin is rancid in odor and easily detected (Sanborn, R. 304; Peterson, R. 956). It also changes color (Sanborn, R. 304). It is undisputed that the Pure-Pak machine in operation gives off no

rancid odor (Dean, R. 965; Peterson, R. 952, 955-956). Dr. Arnold witnessed the machine in operation in the Risdon Dairy, Detroit, Michigan, for several hours (R. 1160) while gathering data for Plaintiff's Exhibit 4, a report dated December 4, 1937 favorable to paper containers, which see (R. 1397), and he did not recall any rancid odor (R. 1163). He testified that paraffin in its natural state is odorless (R. 1163).

Dr. Arnold also testified that he had never heard of anyone becoming ill from the oxidation of paraffin (R. 1179). There is no testimony either that the weak organic acids resulting from the oxidation of paraffin have any ill effects, or that paraffin used on milk containers has ever oxidized, or that milk has ever received an odor from paraffin, and the fact that oxidation of paraffin can be detected by simply smelling the container as Dr. Sanborn did at the hearing is ample protection against any imaginary danger that the City fears.

So much for the manufacturing process and its lack of possibility of oxidation. When filled with milk, it would take hundreds of hours in the blazing sun to oxidize the paraffin on the container (R. 966). So the possibility of oxidation there disappears.

The tests of Dr. Rice on the odor of bacteria mentioned on page 56 of petitioners' brief were not on Cherry River board used in Pure-Pak containers (R. 416, 431-432). He got the same odors from milk bottle caps (R. 416-417). These odors came from the bacteria (R. 416), and the problem presented by odors from bacteria on paper bottles is, therefore, no different than that presented by odors from bacteria on glass bottles or on paper caps used on glass bottles. The language of the witness was very picturesque and the City cannot be blamed for making the most of it, but the fact remains that the problem

has nothing more to do with paper bottles than it has to do with glass bottles. The witness originally embarked on these experiments only to test paper caps for glass bottles (R. 415).

That the possibility of odors from bacteria is not a problem of paper containers any more than of glass containers is clear from the testimony of this witness, that as a bacteriologist he considered paper containers now in a state of freedom from bacteria justifying their use for milk and cream (R. 412) and that paper bottles are superior to glass bottles (R. 406-407, 424).

The final statement of petitioners (brief, p. 56) that it is not unreasonable "to prohibit the delivery of milk in containers that impart an odor to milk" implies that there was evidence that odors had been thus imparted to milk by paper containers. There is no evidence whatever of this in the record. The absence of all evidence of odor being transmitted to milk by paraffined paper containers is the complete answer to the city's argument under this point.

The Sanitary Control of Paper Containers.

[Answer to Petitioners' Point II-(b)-5; Petitioners' Brief, pp. 56-67.]

In petitioners' brief, petitioners argue that because the paper mills and the converting plants in which the paper is formed into printed "blanks" are located outside of the city, there is an absence of adequate sanitary control over the containers and the city may reasonably exclude them because the city cannot be forced to go outside of the municipality to examine the mills and plants.

If this argument is sound, every article of paper which is used as a food container in the City of Chicago is sub-

ject to the very same objection. It is true that in order to produce a sanitary paper milk board the conditions in the mill and in the converting plant must be sanitary, but the testimony is uncontradicted, forceful and persuasive that the mere passage of time is a great purifier, particularly with respect to the harmful type of bacteria, so that when the flat blanks are received at the dairy the passage of time has itself acted as a purifying factor (Prucha, R. 702-703; Plff's. Ex. 46, R. 1572). While Dr. Arnold, the City's witness, disagreed to some extent with Dr. Prucha's conclusions as to that, he had conducted no complete experiments to determine the time that bacteria survived and he stated that it was a fact that the number of live bacteria on paper board decreases with time (R. 1174) and that in his opinion Dr. Prucha's experiments on self-purification of paper were neither false nor misleading (R. 1176).

Dr. Arnold's objection to inspection of paper containers without going to the mill is that otherwise he would not know where the paper came from (R. 1119, 1146-1147). This does not differ in any detail from the situation of a glass bottle, which may have just come back from the city dump. The source of the bacteria disclosed by a rinse test on a glass bottle is no more certain than the source of the bacteria on a paper bottle, but common sense should tell us that in the case of the glass bottle, the chance of the bacteria being human bacteria is much greater than in the case of the paper bottle. Furthermore, one glass bottle which is contaminated can contaminate others in the common washing process, whereas one contaminated paper bottle (there being no evidence in the record of any such contamination) will not contaminate any others.

Turning to practical milk sanitarians whose testimony is preferable to that of mere theorists, we refer to the testi-

mony of *Dr. Fred O. Tonney*, formerly connected with the Chicago Board of Health for many years and a man thoroughly familiar with both the glass bottle and the paper bottle operations, who testified that he saw no necessity for visiting paper mills (R. 915), that he considered the disintegration test on a paper bottle a more severe test than the rinse test employed on glass bottles by the Board of Health (R. 914), and that he considered the standard rinse test for milk containers equally applicable to glass and to paper from a sanitary standpoint and from a public health standpoint (R. 913).

Dr. H. A. Orris, in charge of milk control for a number of Chicago suburbs where Pure-Pak paper milk bottles have been in use now for more than three years and at the time of his testimony had been in use approximately a year, testified that the control of paper containers was at least equal to the control over glass bottles (R. 572-573), that tests of milk sold in paper containers were satisfactory (R. 575) and that empty paper bottles taken at random, off the line unfilled, had been tested by the rinse test regularly and satisfactorily (R. 575). He receives reports from Dr. Jordan of the American Public Health Association of the quality of the paper board and he has never had any occasion to doubt those reports (R. 576), but if he ever did have a doubt he could easily make a disintegration test in his own laboratory as he has the paraphernalia for it (R. 576). He stated that he would prefer, instead of going to the mill, to take the paper board from the container as it was on the filling line at the dairy (R. 576). He testified that he could check immediately the authenticity or genuineness of reports received and that if he found something wrong with the paper bottle he could stop the use of it in exactly the same way that he does with the glass bottle (R. 595). When asked point-blank:

"Have you had any less control over the paper bottle than you have over the glass bottle?" he answered, "I don't think so." He stated that he had not found any problems in the use of paper containers since November, 1938, in performing tests and research work, of which he felt he did not have absolute control (R. 600).

Mr. M. J. Woodman of the Evanston, Illinois, Health Department, testified that he had never had occasion to go to the paper mill or fabricating plant, that he never considered it necessary; and further, that if he needed to make a test of the paper bottle he could do it very quickly in the laboratory (R. 675-676).

Dr. John R. Sanborn testified that a disintegration test made in the City of Chicago on a carton after it had been sent to the dairy would disclose whether or not that carton was then in a sanitary condition (R. 266), that a disintegration test would give an absolute test whether or not that particular carton was sterile or contaminated and that by picking at random cartons of that kind at the milk plant the public health authorities of the City of Chicago could determine whether or not the cartons being used were sterile or contaminated (R. 267). The cost of the apparatus for performing the disintegration test is $20.00 to $30.00 (Sanborn, R. 266).

Dr. M. J. Prucha of the University of Illinois, testified that the rinse test and the disintegration test on paper containers gave public health authorities adequate and sufficient bacteriological control over the single service container (R. 819). In his opinion, it was not necessary to go to the mill (R. 722). Comparing the tests, for ascertaining the sanitary condition of the glass bottle and the disintegration test and rinse test on the paper container, he testified that he was of the opinion that public health

would now be preserved without any certified list of mills such as he had mentioned in his testimony and in some of his previous writings (R. 833-834). He testified that by his bacteria counts on paper board he could determine whether it would be fit to be used for milk containers (R. 838).

As to detecting the presence of re-used material instead of virgin spruce for the container board, it is undisputed that it may easily be detected (Arnold, R. 1168-1169; Packer, R. 1376).

The City's contention that it cannot supervise paper milk bottles unless it sends inspectors to the paper mills and converting plants where the containers are manufactured wholly disappears upon a consideration of the evidence. It is true that Dr. Prucha of the University of Illinois and Dr. Sanborn of the New York State Agricultural Experiment Station considered it necessary *for their purposes* to examine the paper-making and converting process. One becoming an outstanding expert in this field would naturally start at the beginning. They, however, have furnished their evidence, and their testimony shows clearly that local health authorities need not go to the mills before approving paper containers.

Health officers in the ten North Shore suburbs about Chicago and health officers in Philadelphia saw no need to go to the mills to satisfy themselves of the sanitary properties of the products. Why should Chicago? Public health administration is—or should be—a matter of common sense. The evidence is undisputed that the public health authorities have just as much control over the sanitation of the paper milk container after it reaches the confines of the City of Chicago where it is subject to physical and chemical tests as they have over glass milk bottles, milk itself, or any one of thousands of food

products and food containers manufactured outside of the city and brought there for sale.

There is no more justification for prohibiting the use of paper containers for milk because the City did not see the paper manufactured than there would be for prohibiting glass milk bottles merely because the health inspector cannot follow every glass bottle around on its numerous trips to the store, customer, garbage can, city dump, milk dealers' bottle exchange and thence back to the dairy and to the customer again.

What in the latter situation does the City do? It takes reasonable precaution to see that the bottles of known bad origin (dump and junk yards) are sterilized and that all bottles are washed in chlorine solution so that tests at random (1,400 per year out of more than a hundred million glass bottles delivered yearly—R. 986) seem to indicate that reasonably sanitary results are being obtained.

The mere fact that it is physically possible to subject paper milk bottles to the higher standard of tracing them to their source for every delivery (since each delivery is a single service) does not reasonably justify imposing a requirement that each source be checked as a condition precedent to the use of the paper bottle any more than it would be reasonable to require that glass milk bottles be traced from the dairy back to the Milk Bottle Exchange and again to the dairy before being reused.

Transparency and Cream Line in Paper Containers.

[Answer to Point II-(b)-6; Petitioners' Brief, pp. 67-69.]

Petitioners seek to justify the exclusion of paper milk bottles because they are not transparent, so that the cream line is not observable and because cream does not

rise to the top in a paper bottle as it does in a glass bottle. It was stipulated (R. 1332) that homogenized milk is sold daily in the City of Chicago without any objection from the petitioners. The very definition of this milk prevents the showing of a cream line. It is permitted by the same statute that we rely on in this case as a protection to our right to sell milk in paper bottles.

The state statute under consideration defines homogenized milk as follows (Ill. R. S. 1941 c. 56½, "Foods", Para. 115, subpara. 4):

> "Pasteurized homogenized milk is milk that has been mechanically treated in such manner as to alter its physical properties with particular reference to the condition and appearance of the fat globules, to such an extent that no visible cream separation occurs after 48 hours storage and fat tests of the milk at the top and bottom of a quart bottle do not show a difference in fat percentage exceeding two-tenths of one per cent (0.2%)."

No reason exists for permitting homogenized milk in glass bottles which do not show a cream line and prohibiting Grade A milk in paper bottles which do not show a cream line. There is no evidence in the record showing that the non-transparency of the paper bottle affects public health or perpetrates a fraud on the milk consuming public. It is universally agreed by all milk sanitarians and public health experts that the cream content is easily ascertained by performing the Babcock test on milk whenever desired (Tracy, R. 503; Orvis, R. 573). There is no evidence that plaintiff's milk in paper milk bottles does not have sufficient cream or fat content. Obviously, there is no requirement in the ordinance and can be none prohibiting the public from purchasing milk with cream diffused throughout as in homogenized milk permitted by statute. They may buy it in glass bottles if they want

the cream concentrated or in paper bottles if they desire that the cream be diffused, as in homogenized milk.

Section 3094 of the ordinance requiring "standard milk bottles" was designed to procure sanitary containers for milk. There is nothing in Section 3094 or the "public health reasons" for its enactment (R. 109) having any relation to the transparency of paper bottles or the cream line. This section is not an ordinance on weights and measures, nor was it enacted to regulate cream lines.

The "standard milk bottle" even if of glass, may have a long narrow neck as shown by some of the milk bottles in Plaintiff's Exhibits 13 and 14 (R. 1493-1495), and this mislead the purchaser to think he is getting lots of cream when he is obtaining very little. Furthermore, the cream line does not necessarily determine the amount of butterfat in particular milk (Orvis, R. 573).

The petitioners' argument on this issue wholly ignores the fact that *permitting* the use of paper milk bottles does not *compel* a single person in Chicago to buy milk in them if he desires a transparent bottle. This is the buyer's privilege and election. If he does not want the whole milk and wants to pour off the cream he may buy his milk in glass. Granting him that privilege does not, however, under any rule of reason or under public health principles justify depriving plaintiff of the right to sell milk in paper bottles, nor does it justify depriving customers of their right to purchase milk in paper containers. Whether the cream concentrates is meaningless from a public health standpoint. The significant thing is that there is sufficient butterfat to meet the requirements, easily determined by routine tests.

There is nothing in any of the provisions of the ordinance or the public health reasons for its enactment requiring transparency of a "sanitary dispenser", bottle or

container for milk. There is not a scintilla of evidence in the record which shows or even tends to show that it is necessary or desirable from a public health standpoint that milk bottles be transparent.

On the other hand, there is affirmative evidence that the transparency of the glass milk bottle is a decided disadvantage from the standpoint of the taste of the milk. The paper bottle shuts out rays of the sun which give milk in glass bottles which are exposed to the sun a bad taste because of the sun's action on proteins in the milk (Tracy, R. 494-495). Dr. Tracy further testified that paper is a better insulator against heat than glass is, resulting in maintenance of the coolness of bottled milk longer in paper than in glass (R. 497). This is shown by actual tests and is of great importance because low bacteria counts in milk depend almost entirely upon maintaining the milk at low temperatures which are unfavorable for the multiplication of bacteria.

Condensed milk and other liquids and food products of all kinds are permitted to be sold in tin cans even though the City does not have the same opportunity to inspect the plant in which they are canned as it has in the case of respondent's milk plant, and it is clearly unreasonable to prohibit plaintiff's container on the ground that it is not transparent.

The approval by the State and by the City of Chicago of homogenized milk which by its very definition has no cream line eliminates the absence of a cream line as a proper ground of prohibiting paper containers.

Pacific States Box & Basket Co. v. *White,* 296 U. S. 176 (1935), cited by the City at page 67 of its Brief, has no relation to this item of transparency of milk bottles. The case of *Koy* v. *City of Chicago,* 263 Ill. 122, cited by the City on page 68 of its Brief, holding that

laws may provide the manner in which purity, wholesomeness and freedom from disease shall be secured and "made to appear" does not warrant the city's compelling transparent bottles in order to show a cream line when the sovereign state has approved single-service containers and has approved homogenized milk that never shows a cream line. The wholesomeness of respondent's milk is not questioned. If the fact that the container used by respondent does not show the cream line had any merit as a defense to this suit the Board of Health of the City of Chicago would not have recommended the use of paper milk bottles (R. 1698).

Presumption of Legislative Correctness.

[Answer to Petitioners' Brief, pp. 69-70.]

The comment of the Circuit Court of Appeals (R. 1794) that in the nature of things the City Council could not in 1935 actually have considered and weighed the advantages and disadvantages of paper milk bottles is entirely true, if viewed realistically. The technical argument of the petitioners is that in theory the presumption of correctness of the City Council's action attached in 1935 and "is not impaired by advancing age" (Petitioners' Brief, p. 70).

The admission by the petitioners (p. 70) that the reasonableness of the ordinance is to be tested at the time of an attack on it makes it unnecessary to determine just what weight is to be given in 1939, at the time of the decision of this case, to the action of the City Council in 1935. In the meantime the state legislature had approved single-service containers and, as stated under Point II, above, any presumption of legislative correctness which is to be applied in this case is one arising

from the action of the state legislature rather than from the action of the City Council.

The Circuit Court of Appeals correctly held that the action of the state legislature approving single-service containers made the city's attempted prohibition of single-service containers unreasonable as a matter of fact. Our argument on this question is found under Point II.

Use of Single Service Containers Throughout the United States.

[Answer to Petitioners' Brief, pp. 70-74.]

On the question of reasonableness, the experience of other municipalities was competent and persuasive in showing widespread use of paper bottles without injury to public health and in proving that the paper bottle was "standard". The trial judge properly accepted it for those purposes.

Under this heading, petitioners (p. 70) refer *inter alia* to the use of single-service paper milk bottles in the cities of Evanston and Winnetka. The experience of the City of Evanston in testing the respondent's milk and the paper bottle weekly showed that the bacteria count on quart containers "was very consistent with any of the other dairies putting out milk in bottles" (R. 675). The experience of the health department of the City of Evanston was such that it was never deemed necessary to go to the paper mills or fabrication plants for inspection purposes. If further and more severe tests than the rinse test were needed, the disintegration tests would be resorted to (R. 675). Paper bottles were investigated thoroughly for three years, and three to four hundred tests made before use of the paper bottles was permitted (R. 679-683). Evanston has and is enforcing the United

States Public Health Service model milk ordinance (R. 677-678, 683). No complaint ever existed in Evanston calling for supervision of the use of the paper bottle (R. 686); and the experience in Evanston showed that the bacteria count on glass bottles used for milk was higher than the bacteria count on paper milk bottles (R. 686-687).

Concerning the Village of Winnetka it should be understood that Dr. H. A. Orvis also supervises the control of milk for Highland Park, Lake Forest, Lake Bluff, Glencoe and Kenilworth by a contract between these municipalities and Winnetka (R. 567). They all operated under the model ordinance of the U. S. Public Health Service and had a rating of 96% from this body for the work performed. They have all used single-service paper milk containers since November, 1938 (R. 569). They interpreted the model ordinance as permitting these containers (R. 573-574). Bacteriological control of paper bottles equalled that of glass bottles (R. 585). The Illinois Department of Public Health rated the laboratory procedures employed in these municipalities at 100% and gave a total rating of 96.7 on all procedures employed (R. 577). Dr. Jordan, who sent monthly reports on the bacteria content of paper board as revealed by disintegration tests, was connected with the research department of the American Public Health Association (R. 583).

The daily sale of milk in single-service paper containers in Chicago by restaurants and drug stores was not prohibited or interfered with by the City or its Board of Health at any time (R. 940). This fact is not denied by any evidence or exhibit of petitioners. Exhibit 26 of petitioners (R. 1697) does not destroy the probative value of the evidence that milk actually is served in

paper containers in Chicago drug stores and restaurants. There is no evidence in the record that the use of paper containers in the City of Chicago by restaurants and hotels in the sale of milk has caused any damage to public health or has at any time ever been suspected of spreading disease.

Dr. Arnold testified that he had made no comparative bacterial tests on milk in glass and in paper (R. 1119), had no statistics that the bacterial count in paper was higher than in glass (R. 1120), did not know and had not investigated how many single service milk containers were used daily in the United States (R. 1134-1135), testified that the Board of Health had made no disintegration tests on milk container paper board (R. 1148), that he did not know whether paper milk bottles were used on trains or airplanes and never investigated that (R. 1165-1166), that he had never performed experiments to determine the amount of "chip" (reused stock) in paper board (Rec. 1168-1169), that he had never performed experiments on the harmfulness of acids in paraffin, although he had said that it was a health problem (R. 1177), that he never performed experiments on adhesives in Pure-Pak containers (R. 1179), that he had never performed experiments to see whether metal from printing ink got in the milk, although he had said this was a health problem (the City has wisely abandoned that contention) (R. 1181), that lead poisoning was a hazard although he had made no experiments and had no statistics (R. 1184), and that he never made any tests for the effect of respiratory secretions (R. 1190).

But Dr. Arnold was asked (R. 1166):

> "Doctor, if the control of milk is an ever-changing problem, as you testified on direct examination [R. 1066], is not the experience of public health authori-

ties throughout the country—and I am referring to public health authorities of cities—to be considered in determining whether or not the paper container presents a public health hazard?

"Dr. Arnold: Yes, possibly it is, yes.

"Q. But you made no investigation?

"A. No, sir."

This testimony from the chief witness for the City who also attended and counselled the petitioners' attorneys at all hearings and depositions (R. 1106-1107), is ample justification for the trial judge's refusal to ignore years of use and country-wide experience. The trial court in appraising the evidence tersely concluded that "experience is more persuasive than the theory of experts".

Dr. Paul H. Tracy testified that the Pure-Pak machine was used successfully at the model dairy of the University of Illinois College of Agriculture, which supplies the University Hospital and a regular milk route as part of the training of its students and of the researches of its professors (R. 503, 510, 526).

There is also evidence that the Pure-Pak container is being used in 481 separate municipalities, including the principal cities of the country as follows (R. 889-890):

Washington, D. C.,
New York City,
Philadelphia,
Baltimore,
Dayton, O.,
Indianapolis,
Detroit,
Minneapolis,
Seattle, Wash.,
Los Angeles,
San Francisco,
Oakland, Calif.,
Phoenix, Ariz.,
Flint, Mich., and
Louisville, Ky.

Approximately three or four hundred thousand Pure-Pak containers were being sold daily at the time of the trial (R. 890). [This figure is much larger now.]

The stipulation naming 68 municipalities in metropolitan Chicago which had been using this container for more than a year at the time of trial is set forth in the record (R. 692).

Dr. J. R. Sanborn testified (R. 38-40) that he had personal knowledge that the paper container was being used in New York City; forty cities and towns in the vicinity of New York City; Boston, Mass.; numerous cities and towns around Boston, such as Quincy, Cambridge, Somerville; and that it was being used in Baltimore, Philadelphia, Washington, D. C.; Detroit and Flint, Michigan; Duluth, Minnesota; Dayton, Ohio and Toledo, Ohio. He also testified that 40 or 50 cities and towns in Canada are using single service containers; Toronto, Hamilton, Sarnia, Peterborough and Guelph included (R. 153).

Mr. A. E. Carpenter of Sylvan Seal Milk, Inc., Philadelphia, which has a plant in Philadelphia using three Ex-Cell-O Pure-Pak machines and a plant in Baltimore using one such machine, testified by deposition that they deliver milk every day in the year except Sundays out of the Philadelphia plant to the Philadelphia area—including the City of Philadelphia, Trenton, N. J., Camden, N. J., Atlantic City, N. J., Wilmington, Del., and west of Philadelphia for about fifty miles to a great many towns (R. 1386) and that the Philadelphia plant alone is subject to the jurisdiction of 55 different health officers (R. 1390). Out of the Baltimore plant, Sylvan Seal Milk delivers milk to Baltimore and the City of Washington and also towns between Baltimore and Washington (R.

1386). The Philadelphia plant has a capacity of 120,000 quarts per day and this company has sold hundreds of thousands of quarts of milk in Pure-Pak containers (R. 1387). No complaints of absorption by the containers were received from any health authorities or customers (R. 1393).

All of the municipalities served by Sylvan Seal are ones which "certainly do", according to Mr. Carpenter, regulate the inspection, sanitation and handling of liquid milk and cream through their health departments (R. 1389), and they have approved the sale of milk in Pure-Pak containers (R. 1390).

Mr. Carpenter identified photographic copies, which are offered in evidence with his deposition, of letters from health authorities under which his company is doing business and identified the facsimiles as accurate and testified that he had seen the originals which were in possession of his company and that they were signed by those health officers (R. 1390-1391). None of these officers issued any other permits than the letters (R. 1391).

We shall not encumber this brief with all of these letters, but relevant excerpts are here set forth, because they have not previously been called to the Court's attention:

Plaintiff's Exhibit 5 (R. 1471):

From Herbert M. Packer, Chief Division of Housing and Sanitation, Bureau of Health, Philadelphia, Pa., November 27, 1936:

> "In reply to your query of November 23, regarding the use of paper milk bottles in the City of Philadelphia, we have found that they have complied with all the sanitary laws of this City, and

from an inspection which I, personally, made of your plant, I believe they are most decidedly a progressive step in the sanitary handling of milk."

Plaintiff's Exhibit 6 (R. 1471):

From Dennis J. Sullivan, Deputy Health Officer, Department of Health, Jersey City, N. J., November 28, 1936:

"Answering your second question first, this department does not object to distribution of milk in paper containers provided the containers are paraffined in the plant where they are filled and just prior to filling.

"Milk has been distributed in paper containers in Jersey City by four large milk companies for over a year, we see nothing objectionable about this method of distribution and apparently it is satisfactory to the consumer."

Plaintiff's Exhibit 7 (R. 1472):

From John C. Foote, Milk Inspector, Board of Health, Wilmington, Del., November 30, 1936:

"In answer to your phone call of November 27th in reference to our finding of paper containers.

"I want to say that they are without a doubt the best in our city, from a bacteria count they are almost 100%. I have never picked up a sample over 3,000 bacteria since they have been coming into our city, and I have visited your plant and find it complying with all our rules and regulations from a health standpoint.

"P. S. As you know I was opposed to the containers when they first made their appearance but after giving them a fair trial here, I will say they are a perfect container and will be a credit to any community."

Plaintiff's Exhibit 8 (R. 1473):

From W. K. Moffett, Director, Bureau of Milk Sanitation, Department of Health, Commonwealth of Pennsylvania, Harrisburg, Dec. 1, 1936:

"The Pennsylvania Department of Health has for a long time approved the use of paper containers for milk distribution. This includes the paper container which is made in the factory and paraffined before shipment to the milk plant in a sealed package, and the paper container made completely in the milk plant and subjected to a bath of hot paraffin just before filling. We think this latter bottle furnishes a container for milk which more nearly meets our standards for a sterile milk container than does the glass bottle put through the average soaker type washer where it has been subjected to an alkaline treatment and later a steam or hot water treatment.

"We have not been satisfied with the condition of the average glass bottle as it comes from a soaker type washer. It has been our experience that it is difficult to get a complete job of sterilization of the glass container due to the mechanical failures of the machine; the maintenance of the proper water temperature and the fact that the glass container has gone through an alkaline solution which, because of not being changed frequently may be a source of contamination rather than a cleansing agent. We feel so strongly on this subject that we contemplate adding a last rinse with chlorinated water.

"Supervision of the milk supply is much easier from a health standpoint where a paper container is in use than with a glass container. We also like the idea of the paper being used once and then destroyed. A glass container lends itself so easily to so many uses other than that of a container for milk and so often gets back to the milk plant in such bad condition that sterilization is such a difficult job that we would welcome the extension of the use of a paper container more generally."

Plaintiff's Exhibit 10 (R. 1474):

From Dr. George W. Grim, Milk Control Officer, Milk Control District No. 1, Associated Suburban Boards of Health, Ardmore, Pa., Dec. 2, 1936:

> "In response to your recent inquiry, please be advised that I am satisfied that the Silver Seal Dairies [Note: This is the prior corporate name of Sylvan Seal Milk, Inc.] have met substantially all of the requirements for the production, processing, distribution and sale of milk and cream in this District and have continued to do so. I particularly favor the use of the single service container for milk distribution. The difficulties we encounter in washing glass bottles are such that I doubt that they will ever be fully overcome."

If any such dire results as Dr. Arnold intimated would result from the use of paper containers, these other cities would have found it out long ago. These cities are comparable to Chicago. Chicago is neither any dirtier a place than they, nor are her problems of milk distribution any different in substance than theirs.

Every danger which the City pretends to fear from the use of paper containers is answered by the successful practical experience of cities of this country and Canada in using such containers.

In an effort to escape the force of the competent and convincing evidence produced as to the daily successful use of paper containers for milk elsewhere, petitioners say that they declined to accept the proffered issue and to introduce testimony as to prohibition in municipalities other than Chicago. The only answer to this is that there was no such evidence to offer. If it existed, petitioners would have brought it forth and they would have proven every prohibition or unsuccessful experience to justify their position. Not being able to meet this issue, peti-

tioners objected vigorously to the evidence and talked about peculiar local conditions in Chicago. What condition is peculiar to Chicago that makes experience elsewhere non-persuasive? The record is entirely silent.

Petitioners ask the Court to disregard the evidence. The Court is asked to ignore what the common man knows about paper containers and to accept instead theoretical objections which did not deter the state legislature from approving them.

Argument as to "future health hazards" from the use of paper containers is contradicted by the evidence in the record. Petitioners do not point to a single fact indicating any possibility of an outbreak of amoebic dysentery or any other disease because of the paper bottle. We concede that prevention is better than cure, but epidemics do not occur without cause and in the absence of any evidence whatever that paper containers have, could or might cause an epidemic, the Court need not guess or surmise that they will.

We have already referred to the fact that the rule in Illinois is that an ordinance enacted under a general grant of power from the state legislature may be set aside upon judicial review if it is so unreasonable "that there can be no question about it". No one isolated bit of evidence or type of evidence would satisfy that requirement, but obviously if experience had shown single-service containers to be dangerous elsewhere that would be relevant in determining that the city council of the City of Chicago was not acting unreasonably in prohibiting them. That being true, evidence of successful use elsewhere is competent and relevant in determining whether the city council of the City of Chicago is acting reasonably in rejecting not only the approval of the common man of paper containers for food, but also the specific successful

experience of other municipalities with single-service containers for milk.

The facts referred to in the quotation from *Standard Oil Co.* v. *City of Marysville*, 279 U. S. 582 (1928), show the question there under consideration to be debatable. If the announcement that "we may not test in the balances of judicial review the weight and sufficiency of the facts to sustain the conclusion of the legislative body" is accepted as meaning that the court may not determine whether an ordinance of the City of Chicago is reasonable, then the case does not announce the Illinois rule which governs here and which has already been sufficiently set forth to furnish a ground of decision.

Regulation of Paper Milk Containers by the State of Illinois.

[Answering Petitioners' Brief, p. 74.]

Petitioners contend that the recognition of the use of paper milk containers by the State of Illinois "is merely another instance of their use elsewhere". An examination of Point II of our argument, above, will indicate our entire disagreement with any such theory. We think that the approval by the state legislature and its department of health is not only material but conclusive as to the unreasonableness of the city's action when it is considered that the city is a creature of the state.

Regulation of Paper Milk Containers in the Model Ordinance of the United States Public Health Service.

[Answering Petitioners' Brief, pp. 74-76.]

In determining the reasonableness of the Chicago ordinance the fact that the United States Public Health Service has approved single-service containers is properly a mat-

ter of notice. The argument that the Model Ordinance and regulations (R. 1699-1704) of the United States Public Health Service compel each municipality which permits single-service containers to inspect paper mills and fabrication plants is not borne out by the regulations themselves. We have already shown, in answering pages 56-66, of the Petitioners' Brief that tests which can be made within the municipality of the sanitary properties of the paper bottles to be used there are adequate to determine and control the sanitation of paper milk bottles just as effectively as the sanitation of glass bottles is controlled.

The City of Chicago has found no occasion to inspect mills or fabricating plants since the injunction was entered in the present case in October, 1940, and it has voluntarily permitted the use of paper containers not protected by such injunction without inspecting paper mills or fabricating plants and without there being the slightest intimation of detriment to the public welfare.

Use of Paper Containers for Other Purposes.

[Answering Petitioners' Brief, p. 77.]

The contention of petitioners (p. 77) that the use made of other paper containers in the city is not comparable to respondent's container is challenged and denied. The universal acceptance of paraffined paper containers for liquid and solid foods of all kinds cannot be explained away by pointing out superficial distinctions between milk and such other foods. Furthermore, at the time of the trial, milk was sold daily in the City of Chicago in paper cartons called "carry out service" cartons (R. 1482). Petitioners say that a Board of Health regulation (Petitioners' Exhibit 26; R. 1697) illegalizes this common practice known to everyone. But since the Board of Health

has made no effort to prevent such practice, its conduct amounts in effect to an approval of these carry-out containers as "sanitary dispensers", under the proviso of Section 3094 (R. 108-109).

The fact, if it be a fact, that the sale of milk and milk products by soda fountains and restaurants in the City of Chicago in paper containers is a violation of some Board of Health regulation does not detract from the persuasive force of the evidence as proving that there is no danger to the public health from such consumption of milk in paper containers.

The use of paraffin paper and paraffin paper board is so universally accepted as sanitary by the common man based on his experience that the attempt on the part of the city council of the City of Chicago to prohibit its use at this date is palpably arbitrary and unreasonable. The question is not made debatable by the mere fact that the attorneys for the City of Chicago do debate it.

The Proposal by the Board of Health that the City Council Permit the Use of Paper Containers.

[Answering Petitioners' Brief, p. 78.]

The Board of Health of the City of Chicago is charged by law with the enforcement of the health ordinances and is presumably composed of experts whose opinions on a question of fact would be entitled to great weight as an administrative determination of such question. Petitioners concede that during the pendency of this suit the Board of Health recommended the approval of single-service containers by the adoption of the model ordinance and regulations of the United States Public Health Service, and the only answer to this recommendation which the petitioners offer in this Court is that the regulations

require inspection trips to mills and fabricating plants which we have already discussed and shown to be unsound when viewed practically rather than theoretically.

The Conclusion on the Question of Reasonableness.

Petitioners have argued the question of reasonableness by dividing their arguments into numerous branches and saying that no single feature of this case proves the unreasonableness of the city council's action. We submit that in determining the question of reasonableness no single bit of evidence should be singled out as determinative. The question on this branch of the case is whether taking all of the evidence the respondent has so established the fact that its paper milk bottle is such a "known, wholesome article" that under the Illinois decisions the city council has no right to prohibit it.

If the petitioners are correct in saying that the Circuit Court of Appeals did reach the conclusion that the ordinance was unreasonable and invalid, we believe that such finding is amply sustained by the grounds referred to in the majority opinion. The following considerations lead clearly to ~~the~~ conclusion that the ordinance is unreasonable:

(a) Widespread use of paper generally for food products;

(b) The approval of single-service containers by the state legislature of Illinois;

(c) Approval of single-service containers by the director of the Department of Health of the State of Illinois;

(d) Approval of single-service containers by the United States Public Health Service;

(e) Approval of single-service containers by the Chicago Board of Health;

(f) Widespread and favorable use over a period of many years of single-service containers in cities comparable in size to the City of Chicago;

(g) Favorable use of single-service containers in the metropolitan Chicago area outside of Chicago after November 1938;

(h) The favorable and overwhelming opinion of experts from the University of Illinois and the New York State Agricultural Experiment Station.

To these favorable elements may now be added: Continued, successful use in practically every large city in the country, including the City of Chicago, and widespread use in army training camps.

If the evidence in the record and the facts of which the Court should take judicial notice are not sufficient to justify the finding of the trial court that the ordinance was invalid if construed to prohibit paper containers, then it is difficult to conceive of any case in which the Court would be justified in finding that the city council's action was "palpably arbitrary and unreasonable."

IV.

The Respondent's Single Service Container Is a "Standard Milk Bottle."

The District Court held that the respondent's single service container is a "standard milk bottle" within the meaning of the ordinance (R. 1756).

That the respondent's single service container is a "milk bottle" was apparent to the trial judge. He said (R. 1753):

> "The Court has no difficulty in holding that plaintiff's single service container offered and admitted in evidence in this case is a 'milk bottle' within the meaning of the ordinance. The definition of the word 'bottle' given by practically all lexicographers, as well as the meaning of the word as used in common speech, shows that the word has no limited and restricted meaning. It is a word of broad and extensive connotation. Webster's new International Dictionary states, among other things, that the word 'bottle is now so loosely used that its limit of application is not well-defined.'"

The trial court discussed the use of the word "bottle" in common speech, the accepted dictionary definitions of the word, the various types of containers that, historically, had been included within the connotation of the word, and concluded that there was no requirement that, as the petitioners contended, a milk bottle should be made of glass (R. 1753).

In discussing the word "standard" as used in the phrase "standard milk bottle" the Court pointed out that it was not confined to any local construction that might be placed upon the word, but might resort to the type or model which is recognized generally in the industry. In

particular, the Court placed its decision (R. 1755) of this aspect of the case on the sound ground that *"The ordinance is not static. The words are general and continuing in their operation. The ordinance must be construed in the light of new and changing conditions and current thought and practice. If, in the course of time, the advancement of science has produced a container which serves the same purpose as a glass container, and if the product delivered therein conforms to the requirements of sanitation prescribed by the health ordinances, then the ordinance must be given such construction as to permit the use of the later developed scientific container."*

It was urged by the City in the Circuit Court of Appeals that the construction of the phrase "standard milk bottle" by the District Court to include plaintiff's single service container was erroneous for the reason that this type of container was not in use at the time of the enactment of the ordinance in question, and the phrase "standard milk bottle" must be interpreted to include only such container or containers as the City Council might have been familiar with, or which were in use, on the date of the enactment of the ordinance. The Circuit Court of Appeals sustained this contention of the City and held that the construction placed upon the phrase by the District Court was untenable, that the words in legal sense could be interpreted only to permit the type of container that was a "standard milk bottle" when the ordinance was enacted, and that the glass bottle in use in the City of Chicago for delivery of milk at that time was the only receptacle contemplated or permitted by the ordinance. The Circuit Court of Appeals said (R. 1786):

> "Thus the theory of construction advanced by the plaintiff, apparently followed by the District Court, to the effect that the words 'standard milk bottle'

should be interpreted in accordance with the meaning of those words at the time of trial rather than their meaning at the time the ordinance was enacted, is not tenable. The recognition of such a theory would, in effect, impose legislative functions upon the courts. It would mean that a legislative enactment might mean one thing today and something else tomorrow. Changed conditions, of course, may make advisable a repeal or modification of existing legislation, but if so, the appeal should be to the legislature and not the courts."

As support for this view the Court cited the case of *People v. Barnett*, 319 Ill. 403 (1926), which does seem to hold that the words of a statute are to be construed in accordance with their meaning *at the time used rather than by a meaning subsequently acquired or given them.* However, since the decision of that case fifteen years ago, the question whether the meaning of a word or phrase as used in a legislative enactment may be extended to include within its scope a signification not present in the mind of the legislature at the time of such enactment has been definitely answered by the Supreme Court of Illinois in the affirmative. In *City of Chicago v. Bert Alpert, Inc.*, 368 Ill. 282 (1938)—a case not cited to the Circuit Court of Appeals—the Illinois Supreme Court held that "garages" as used in a state statute in 1911 included (*as present counsel for the City of Chicago contended*) vacant lots, called parking lots, which were not known at the time of the enactment of the statute. Even though the word "garage" meant an enclosed structure or building to the legislature in 1911 when the statute was passed, the Court said (p. 286):

"The General Assembly, in the quoted delegation of power, *did not define 'garages' thereby limiting the authority delegated by making the word 'garages' a static or dormant concept* rendering cities impotent

> to cope with the everchanging conditions of a mobile and complex society. In short, cities and villages are not restricted, in directing the location and regulating the use and construction of garages, to such premises as may have conformed to the accepted popular definition of the word 'garage' in 1911, when it was incorporated in the statute. Conditions attending the storage and parking of automobiles in metropolitan areas today are vastly different from those prevailing a quarter of a century ago when the State empowered cities to regulate and license garages. It is common knowledge that in cities considerable areas are devoted to parking and storing motor vehicles. Casual observation will disclose that in some instances the premises are denominated parking lots and, in others, outdoor or open-air garages. We are not required to be insensible to this mode of transacting an important part of the automobile business. The express power to regulate the use and construction of garages is sufficiently comprehensive to authorize cities and villages to license open-air as well as closed public garages. A legitimate exercise of this power is immune from constitutional assault." (Italics ours.)

The holding of the Circuit Court of Appeals that the language of the ordinance is to be interpreted as it was used by the City Council in 1935 was due to our failure to cite this decision in our brief in that Court. Contrary to the dictum in the earlier case of *People* v. *Barnett*, 319 Ill. 403 (1926) the later case is a controlling adjudication by the Supreme Court of Illinois which establishes that legislative language as used in an ordinance is dynamic, not static.

If a vacant lot used for parking automobiles is a "garage" within the meaning of a statute passed in 1911, then there is nothing incongruous in holding a paper milk bottle in 1939 to be a "standard milk bottle" as that term was used in 1935. It will be noticed that counsel for the City of Chicago were arguing for the dynamic interpreta-

tion of legislative language in the *Alpert* case, because that would sustain the claim of power to regulate open parking lots on the theory that they were "garages", whereas here they reverse their position and contend that legislative language must have a static, unchanging meaning.

Quite aside from the well-reasoned authority of the *Alpert* case, it would seem that the rule of construction there approved is highly desirable since it renders possible the prompt acceptance of improvements in a changing society. Law ought not to lag behind other sciences but should be sufficiently flexible to meet new conditions in all fields of industry.

The decision of the Indiana Supreme Court in *Uservo, Inc.* v. *Selking*, 217 Ind. 567, 28 N. E. (2d) 61 (1940), clearly supports our contention that the undefined phrase in the ordinance, "standard milk bottle" is a general phrase including all containers commonly used in selling milk (R. 1483, 1493, 1495). In that case the Court refused to hold the defendant liable for contempt for an alleged violation of a mandatory decree requiring delivery of a "standard milk bottle" because the decree there, like the ordinance here, did not define what a standard milk bottle was. The trial court there heard much evidence on the subject of what was a standard milk bottle, and in discharging the defendant who returned what he contended was a "standard milk bottle", the court at page 63 said:

> *"It will be noted in this case that the phrase, 'standard bottles', is not defined in the order. There seems to be no universal or well defined meaning of what does or does not constitute a standard milk bottle.* It was contended with much vigor in this case what might be a standard bottle in one city in Indiana might not be regarded a standard bottle in another. Much testimony was heard by the court concerning this subject. As was pointed out in the New

Jersey case, last above cited [*Bayer* v. *Brotherhood of Painters*, 108 N. J. Eq. 257, 154 A. 759], the appellee is not without remedy. If the order (assuming that the order is valid) is indefinite and ambiguous, a motion to modify and make more definite would be available to her." (Italics ours.)

Further, *Webster's New International Dictionary*, 2nd Ed. (Unabridged, 1937) states:

"* * * Bottle is now so loosely used that its limit of application is not well defined; it is generally distinguished from such vessels as jug or demijohn."

And *Century Dictionary and Cyclopedia* also defines it as:

"A hollow mouthed vessel of glass, wood, leather or other material for holding and carrying liquids. * * *"

Funk and Waynalls' New Standard Dictionary defines it as:

"A vessel for holding, carrying or pouring liquids having a neck and narrow mouth that can be stopped and specif: * * * any of various receptacles serving as a bottle."

It is apparent that respondent's bottle, today commonly used and referred to in the City of Chicago, Washington, D. C., and hundreds of other cities and villages as a "paper milk bottle", fits these definitions, and, as found by the trial court (R. 1752-56), is a "standard milk bottle" within the meaning of "standard" and "bottle".

In ascertaining the correct meaning of the words "standard milk bottle" we should not attribute to the City Council of the City of Chicago, the assumption that there would be no improvement ever made by science in developing milk containers. If a building ordinance required the use of "standard wallboard" or "standard

brick", no one would contend that only wallboard or bricks which were known and manufactured at the time of the ordinance could be used under such an ordinance. The very failure of the City Council to define the term "standard milk bottle" is an indication that it was to be given a broad meaning. Certainly the fact that a particular type of "standard milk bottle" was then generally accepted is no reason for assuming that in the future, when other standard milk bottles had been generally accepted in the industry such later standard milk bottles would be excluded. In a changing civilization it cannot be assumed that the legislature intends that things shall stand still. The law must be dynamic and not static. The shapes of glass milk bottles have varied from time to time, but no one has argued that they cease to be "standard" because shapes have changed.

We therefore respectfully submit that the question in this case is not what was meant by a "standard milk bottle" precisely at the time the ordinance was adopted, but what is meant by "standard milk bottle" at the time the ordinance is being enforced.

The evidence shows without contradiction that cities operating as is the City of Chicago, under the United States Public Health Service Model Milk Ordinance, from which the term "standard milk bottle" is taken, have, without amending their ordinances, construed it as did the trial court, so as to include single service containers (Oryis, R. 574).

In the mimeographed copy (January, 1939) of the United States Public Health Service Model Ordinance, Section 10, (which corresponds to Section 3094 of the Chicago ordinance), required "standard milk bottles", (Krueger, R. 993-994, Deft's Ex. 16, R. 1677) but, as admitted by the witness Krueger (R. 983, 995) the Code ac-

companying it contained items 12-p and 15-p, which were as follows:

Item 12-p:

> "All milk and milk products, containers and equipment, except *single-service containers*, shall be thoroughly cleaned after each usage. All containers shall be subjected to an approved bactericidal process after each cleaning and all equipment immediately before each usage. When empty and before being returned to a producer by a milk plant each container shall be effectively cleaned and subjected to bactericidal treatment."

Item 15-p:

> "Milk bottle caps or cap stock, parchment paper for milk cans, and *single-service containers* shall be purchased and stored only in sanitary tubes and cartons, respectively, and shall be kept therein in a clean, dry place." (Italics ours.)

Thus we find municipalities, and even the United States Public Health Service itself, construing the term "standard milk bottles" as including paper single service containers. The amendment to section 10 of the model ordinance, adding "or in single service containers", was made in June, 1939, after the contention of the City of Chicago that single-service containers were *not* standard bottles, was widely known (Krueger, R. 994-995, Deft's Ex. 17, R. 1678).

Clearly, the learned trial judge was correct in holding that "plaintiff's single service paper containers, as offered and admitted in evidence, are 'standard milk bottles within the meaning of the ordinance'" (R. 1755-56).

The Circuit Court of Appeals in its opinion referred to certain instances in which distinctive terms were used in the testimony and in correspondence distinguishing between glass milk bottles and paper containers. Since

this entire controversy revolves around differences between glass milk bottles and paper milk bottles it is not at all strange that the descriptive terms used in the course of the controversy to describe glass bottles and paper bottles should have differentiated between them. In considering the weight given to this evidence by the Circuit Court of Appeals, it should be remembered that that court was deciding whether the term "standard milk bottle" when used in the year 1935 included a paper milk bottle. We submit that under the *Alpert* case discussed in this subdivision of our brief, the meaning of the term in 1940 and not its meaning in 1935 was the ultimate fact to be reviewed by the Circuit Court of Appeals. The District Court had decided that the term "standard milk bottle" did reasonably include a paper milk container in October, 1940, when the District Court decree was entered. Since the reasoning by which the trial court reached that result is sustained by the doctrine of the *Alpert* case—that undefined general language is to be given the meaning which from time to time it acquires—the finding of the District Court on this issue should be affirmed.

The approval of single service containers by the Illinois legislature and the voluntary action of the City of Chicago since October, 1940, in permitting the use of containers not protected by the decree in the present case should indicate to this Court that no actual health hazard is involved, but that the questions to be decided are mere legal questions. The trial court found expressly that single service containers present no health hazard, the Circuit Court of Appeals denied a supersedeas to stay the operation of the trial court's injunction, and the majority opinion of the Circuit Court of Appeals indicates its agreement with the District Court that these

containers present no health hazard. An application of the rule invariably applied by this Court that it will not disturb the finding of fact approved by a District Court and the Circuit Court of Appeals rebuts any contrary argument of the petitioners. In addition, the record itself abundantly sustains the proposition that paper milk bottles present no health hazard.

V. Conclusion.

Without repeating the evidence on the issues in this case, we do desire to summarize in a way not hereinbefore presented some of the respects in which the Pure-Pak paper milk bottle is superior to the glass milk bottle.

Not only does the Pure-Pak single service container have merit in the sense that it has not created any health hazard, but it also has a tremendous affirmative health advantage over a glass milk bottle, all of which must be considered in determining whether the City of Chicago is acting reasonably in excluding this paper bottle from the Chicago market, especially when the Board of Health in charge of enforcing the ordinance and protecting the public health of the city approves, and by its official action, recommends its use.

First: The Pure-Pak container is used only once. This eliminates all danger of the bottle itself contaminating anyone else, eliminates the hazard of possible human or mechanical failure in washing to which the multi-service container is subjected, and is of great usefulness in hospitals, particularly isolation sections for contagious diseases, where concededly sometimes cross-contamination occurs.

Second: Immediately before being filled and after the Pure-Pak container has had its last manual handling (being handled on the outside edges only) the container goes into a hot paraffin bath which concededly has *some* bactericidal effect. The amount of this bactericidal effect is not so important as the fact that concededly it has some effect which is distinctly helpful from a public health standpoint.

Third: The container is tamper proof. The contents cannot be removed without tearing open the pouring spout

or defacing beyond replacement the wire staple. Each paper container bears printed or indelibly stamped upon it the date it is to be sold and there can be no transferring of the contents from one container to another or no "switching" of milk bottle caps such as may occur in the case of the ordinary glass bottle with a plug cap, with or without an unlocked "hood." That this feature of Pure-Pak containers prevents a definite evil is indicated by the "public health reason" of the Chicago Board of Health appended to Section 3094 of the ordinance (R. 109):

> "Another practice on the part of some distributors is the filling of returned bottles along the milk route, particularly at retail depots. This item expressly forbids this practice."

Fourth: And second only to the single service feature of the container in importance, the pouring lip over which the milk or cream passes after the pouring spout has been opened is tightly sealed at all times from the moment that the side-seam of the flat-blank is mechanically sealed at the converting plant until the customer himself tears open the pouring spout. At all times, therefore, that part of the container over which the contents flow is sealed against contamination, even in the dairy itself. Compare this with the ordinary glass milk bottle whose pouring lip projects upward at a place where contamination is most likely to occur—this being the very point, and the only point, over which the contents of the glass bottle invariably flow.

Fifth: The Ex-Cell-O Pure-Pak machine which fills the containers is operated by two persons instead of the three needed in a typical glass bottle dairy with a ratable reduction in the hazard from human contamination.

Sixth: After flat blanks are taken from the sealed packages and placed upon the machine by the operator, who for this purpose grasps them on the outside edges, the filling operation is in a covered machine and the paper bottle is not again touched until it has been formed, the bottom flaps sealed, the whole bottle paraffined, automatically filled, closed and stapled and inspected by the use of a light behind the passing line of bottles. Contrast this with a line of empty glass milk bottles travelling from the washing department to the filling department, subject to all of the bacterial contamination that may be in the air of the dairy as well as to the possibility of human contamination. (For a good comparison between paper and glass operations, see Tonney, R. 903-911).

Seventh: The filling operation takes less time after the container is last touched by hands until the operation is completed than in the case of the glass bottle. The less time taken in the filling operation, of course, the less opportunity for contamination in that process.

Eighth: The bottom of the Pure-Pak paper bottle is square so that a number of them tightly packed together prevent the circulation of warm air and thereby more easily keep the contents cool, an extremely important health feature in view of the effect of low temperature in preventing the multiplication of bacteria in milk.

Ninth: Paper is a better insulator against heat than glass so for that additional reason it is easier to keep cool the milk in such containers than in glass containers.

Tenth: The shape, weight and size of the corrugated cartons into which the paper bottles are placed at the dairy for distribution lend themselves ideally to refrigeration in the truck and encourage adequate refrigeration. Compare this with an open crate of glass milk

bottles. From a health standpoint, the low bacteria count of the milk when it is delivered to the consumer is the object sought and paper bottles best attain that end.

Eleventh: There is no danger of glass breaking and cutting anyone.

Twelfth: There is no danger of glass from this or other broken bottles getting into the milk.

Thirteenth: Owing to the facts that the containers to be filled are shipped direct from the factory and need not be transported from the stores or customers and that the containers when filled are lighter and more compact and more easily kept cool en route than glass bottles in crates, the pasteurizing and bottling of the milk in paper bottles can be done economically right in the dairy region, reducing the time between "cow and consumer." This reduces the opportunity for bacteria to multiply, because multiplication of bacteria depends upon time and temperature. The milk stays fresh longer in the hands of the customer.

Other considerations of present national policy in conserving automobile tires and manpower are promoted by paper milk bottles, as follows:

Fourteenth: Milk delivered in paper milk bottles saves man power by increasing store sales and cutting down on house-to-house deliveries. The convenience, light weight and lack of danger of breakage induces the customer to carry the milk from the store rather than having it delivered to his door.

Fifteenth: Paper bottles filled with milk weigh less than half as much as a similar quantity of filled glass bottles. This lighter weight and the improved method of distribution which such lighter weight makes possible result in the saving not only of labor but of trucks, rub-

ber tires, gasoline and wear and tear on streets and highways for the reasons that:

(a) Wholesale deliveries to stores rather than retail delivery from house to house is promoted as stated in the next preceding paragraph;

(b) Each delivery truck can carry a great deal more milk than in glass containers without increasing the total weight of the load;

(c) There is no heavy return load of crates and bottles as in the glass bottle operation.

For the reasons stated, we submit that the judgment of the Circuit Court of Appeals should be affirmed.

Respondent.

MOTION OF PETITIONERS FOR LEAVE TO FILE A REPLY TO ADDITIONAL SUGGESTIONS FILED BY AMICUS CURIAE.

During the oral argument of the above-entitled cause on March 31, 1942, Mr. Justice Reed requested the attorney general of the State of Illinois, who appeared as *amicus curiae,* to file a memorandum of authority. Counsel for petitioners were not informed until April 2 that the attorney general had filed a memorandum on March 31, entitled "Additional Suggestions Filed by *Amicus Curiae,* Pursuant to Suggestions of Mr. Justice Reed." Counsel for petitioners obtained a copy of the memorandum on April

2 and now ask leave to file a memorandum in reply to that filed by the attorney general.

Respectfully submitted,

CHAMPLIN-SHEALY COMPANY, CHICAGO 365

IN THE

Supreme Court of the United States

OCTOBER TERM, A. D. 1941.

No. 706

CITY OF CHICAGO, a Municipal Corporation, BOARD OF HEALTH OF THE CITY OF CHICAGO, DR. ROBERT A. BLACK, Health Commissioner and Acting President of Board of Health of the City of Chicago,
Petitioners,

vs.

FIELDCREST DAIRIES, INC.,
Respondent.

PETITIONERS' OBJECTIONS TO RESPONDENT'S MOTION TO STAY MANDATE AND TO MODIFY THE JUDGMENT AS TO COSTS.

Objection to Motion for Stay of Mandate.

The petitioners object strenuously to any stay of the mandate. A stay would delay the prosecution of the proceedings in the state court brought by the respondent's parent corporation, the Dean Milk Company. The first step to be taken by the City of Chicago in that case is to file a petition to vacate the temporary injunction obtained by the Dean Milk Company on the basis of the federal

court injunction which the judgment of this court vacates. The petition to be filed must allege that the federal court injunction no longer exists. Consequently the petition cannot be filed until the federal District Court has entered its order based on the mandate of this court.

Any delay in the prosecution of the state court case will be harmful to the interests of the City of Chicago because of the urgency of clarifying the doubt cast by the holding of the Circuit Court of Appeals on important powers of the city to adopt public health regulations.

Objections to Motion as to Costs.

The judgment properly allowed costs to the petitioners because it was the respondent (the trial court plaintiff) who selected a federal court in which to sue the petitioners. In urging the court to provide that neither party should recover costs against the other, the respondent is saying that the petitioners should bear almost all the costs, for the petitioners were on the losing side in the District Court and in the Circuit Court of Appeals. From the respondent's argument it would almost seem that the federal forum was originally chosen by the petitioners rather than by the respondent.

In an attempt to shift to the petitioners the responsibility for the federal court litigation, the respondent reviews some aspects of the state court litigation and comments that "the petitioners resisted the trial of the similar case in the state court" and that the incurring of costs was as much due to the "unsuccessful desire of the petitioners to have the case determined by the Federal courts" as it was due to the respondent's prosecution of the suit after the 1939 statute was enacted. The respondent refers par-

ticularly to contentions made by the petitioners in the state court that the determination of the state court case should await the determination of the federal court case.

There were obvious and compelling practical reasons for the petitioners to take this position. The state court case was not begun until May 15, 1940, after there had been extended hearings before the federal master resulting in an accumulation of a record of three thick volumes and after the master had rendered a report favorable to the city. The city did not wish to be compelled to spend the time and money involved in the duplication of this proceeding in the state courts. The city was placed in this dilemma by the respondent and its parent corporation, the Dean Milk Company. The city had no alternative but to defend both federal and state court suits. The respondent's responsibility for the federal court case is not affected by the fact that the petitioners sought to meet the respondent on the merits.

The respondent boldly suggests that the city, which was being sued in the federal and state courts by the respondent and its parent corporation, should have also sought to test the validity and construction of the ordinance in the state courts by proceeding against other dairies selling milk in paper containers after the federal court injunction was entered in October, 1940. Obviously any attempt to prosecute another dairy company would have been thwarted by a temporary injunction obtained on the basis of the federal court injunction in this case. Had the city discriminated against other dairy companies which lacked an injunction permitting them to sell milk in paper containers, the respondent would have had a monopoly over this type of milk distribution in Chicago.

Important factors in both the state and federal court litigation are overlooked in the respondent's motion.

1. In an attempt to mitigate its error in seeking a federal court adjudication of state issues, the respondent argues as if there were only one state issue in the case, the effect on the city's power of the Illinois Milk Pasteurization Plant Act which went into effect on July 1, 1939 (Laws of Illinois, 1939, p. 660) after this suit was begun. The other local question was that of the construction of the ordinance—i. e., whether or not the Chicago Board of Health correctly construed the ordinance to forbid the use of paper milk containers. The respondent alleged in its complaint that it was entitled to an injunction on the ground that the ordinance permits the use of paper milk containers (R. 14).

2. It seems clear that the federal court litigation was originally planned by the respondent's parent corporation to avoid a determination of the local questions by the state courts. In 1936 the Dean Milk Company, an Illinois corporation, asked for a permit to sell milk in Chicago in paper milk containers (R. 1692). The permit was not received. The Dean Milk Company had the respondent corporation, Fielderest Dairies, Inc., incorporated in the State of Michigan on November 5, 1937 (R. 844, 1609-12). The respondent obtained authority to do business in Illinois on November 29, 1937 (R. 845, 1613-18). The Dean Milk Company's plant is at Chemung, Illinois (complaint in *Dean Milk Company* case, Joint Statement of Counsel, p. 9) where the plant of the respondent is also located (R. 1030). The allegations of the complaint in the *Dean Milk Company* case (Joint Statement of Counsel, pp. 2-23) and of the complaint in the case at bar (R. 2-15) show clearly that the two corporations in fact carry on one and the same business. These facts indicate that the respondent

corporation was created in order to provide diversity of citizenship as a ground of federal jurisdiction.

3. In saying (motion, p. 3) that the Dean Milk Company began the state court suit "on May 15, 1940 following the passage of the Illinois Milk Pasteurization Plant Act of 1939," the respondent implies that the Dean Milk Company, out of respect for "the appropriate relationship between federal and state authorities," began to litigate the state issue in the state courts when it emerged in the case. That is not why the state court suit was filed. It was begun by the parent corporation only when the federal master ruled against the subsidiary corporation. The master filed his report in the District Court on April 27, 1940 (R. 1710). The state court suit was begun on *May 15, 1940.* The real significance of this date is that *on the preceding day, May 14, 1940,* the City of Chicago urged the federal District Court to enter a decree in accordance with the master's report (R. 1751) but, at the request of counsel for the respondent, who stated that there was no urgency in connection with the disposition of the case, the District Court continued the matter to October, 1940 (R. 1752; see affidavit in Joint Statement of Counsel, pp. 39-40). Obviously the respondent's parent corporation began the state court suit only because it appeared that its subsidiary corporation might be unsuccessful in the federal court litigation.

4. Throughout the course of the litigation the respondent has asserted the invalidity of the Chicago ordinance under the fourteenth amendment to the federal constitution. Mr. Justice Douglas noted in the opinion that this issue "lurks in the case even though it not be deemed substantial." The presence of this issue gave the federal court a ground of federal jurisdiction in addition to the diversity

of citizenship. If only the latter ground had been present, it would have been a simple matter for this court to dismiss the case, as was done in *Hawks* v. *Hamill*, 288 U. S. 52 (1933), on the ground of the reluctance of federal courts to grant injunctive relief on purely local issues. The mere raising of the federal constitutional question by the respondent made such a disposition of the case impossible, for the federal courts had a duty to decide the federal question. Yet there is so little foundation for the respondent's contention of alleged unconstitutionality that *it did not cite in its brief one federal court decision to support it.* The mere raising of this question greatly prolonged the litigation, for it required the extended hearings before the master on the question of the reasonableness of the ordinance in addition to preventing a final disposition of the case here as in the *Hawks* case. This factor is important in considering the responsibility for the federal court litigation.

Since the judgment of this court reversed the judgment of the lower court, costs are properly taxed against the respondent under subdivision 3 of Rule 32 of this court:

> "In cases of reversal of any judgment or decree by this court, costs shall be allowed to the appellant or petitioner, unless otherwise ordered by the court."

The mandatory language of section 254 of the Judicial Code (28 U. S. C. 352) requires that printing costs be taxed against the respondent. Section 254 provides:

> "There shall be taxed against the losing party in each and every cause pending in the Supreme Court the cost of printing the record in such case, except when the judgment is against the United States."

Decisions of this court in which cases have been dismissed on jurisdictional grounds indicate that the costs should be taxed against the respondent. In *Mansfield etc.*

Railway Co. v. *Swan*, 111 U. S. 379 (1884), even though the trial court's judgment was reversed, costs were taxed against the plaintiff in error because the reversal was on the ground that the plaintiff in error had removed the case to the federal court from a state court without diversity of citizenship appearing in the record. In *Graves* v. *Corbin*, 132 U. S. 571, 591 (1889), where the trial court lacked jurisdiction, costs were taxed against the defendant who obtained a removal from the state court even though the plaintiff had urged the Supreme Court to rule on the merits. In *Oklahoma Gas and Electric Co.* v. *Oklahoma Packing Co.*, 292 U. S. 386 (1933), where the decree of the trial court was vacated and the cause remanded to preserve the right of appellant to have the trial court's judgment reviewed, costs were taxed against the appellant because of lack of jurisdiction of this court to entertain a direct appeal even though at the time the appeal was taken the correct procedure under section 266 of the Judicial Code was unsettled.

The opinion in *Railroad Commission* v. *Pullman Company*, 312 U. S. 496 (1941), does not indicate what disposition this court made as to costs. Even if the costs were taxed against the Railroad Commission, there are good grounds here for requiring the respondent to pay them. In contrast to the lack of substance in the constitutional issue in the case at bar, Mr. Justice Frankfurter noted that the constitutional issue was "more than substantial," touching "a sensitive area of social policy." And in the *Pullman Company* case there was not the situation presented here of a federal court plaintiff and its parent corporation going back and forth between the federal and state courts in an attempt to find a forum which would render a favorable decision.

The respondent chose the federal forum to litigate the state issues. The petitioners were compelled to defend the litigation and should not be compelled to pay the costs now that this court has determined that the litigation should have been carried on in the state courts. If the City of Chicago is unsuccessful in the state court litigation, it will be compelled to pay the costs involved there. Certainly it should not be subjected also to costs in the federal court when the respondent should not have begun the litigation there. Of course, if the city is successful in the state courts, it should not be compelled to pay any costs whatever. No matter what the outcome of the state court litigation may be, the costs in this case should be borne by the respondent in accordance with the judgment entered by this court on April 27, 1942.

We urge the court to deny the motion to stay the mandate and the motion to modify the judgment as to costs.

IN THE

Supreme Court of the United States

OCTOBER TERM, A. D. 1941.

No. 706

CITY OF CHICAGO, a Municipal Corporation, BOARD OF HEALTH OF THE CITY OF CHICAGO, DR. ROBERT A. BLACK, Health Commissioner and Acting President of the Board of Health of the City of Chicago,

Petitioners,

vs.

FIELDCREST DAIRIES, INC.,

Respondent.

CERTIORARI TO THE CIRCUIT COURT OF APPEALS FOR THE SEVENTH CIRCUIT, THERE HEARD ON APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE NORTHERN DISTRICT OF ILLINOIS, EASTERN DIVISION.

MOTION TO STAY THE MANDATE AND TO MODIFY THE JUDGMENT AS TO COSTS HEREIN AND REASONS IN SUPPORT THEREOF.

MAY IT PLEASE THE COURT:

Motion to Stay Mandate.

1. Comes now Fielderest Dairies, Inc., respondent herein, by its attorneys, and moves the Court or some justice thereof when the Court is not in session to stay the issu-

ance of the mandate pending the disposition of the accompanying motion of the respondent to modify with respect to the payment of costs the judgment entered herein on April 27, 1942, the text of which judgment is set forth in the appendix hereto.

Motion to Modify Judgment.

2. Comes now Fielderest Dairies, Inc., respondent, within the time allowed by Rule 33 for the filing of a petition for rehearing and moves the Court to modify the judgment entered herein on April 27, 1942, by eliminating from said judgment that portion thereof providing that the vacation of the decree of the trial court is at the cost of the respondent.

Reasons in Support of Motions.

3. In support of the above motions the respondent respectfully represents the following facts.

4. Unless stayed, the mandate will issue on May 22, 1942, twenty-five days after the entry of the judgment (Rule 34). The time for filing of a petition for rehearing also expires May 22, 1942, (Rule 33) and the filing of such a petition does not stay the issuance of the mandate unless the time is enlarged by order of the Court or of a justice thereof when the Court is not in session (Rule 34).

5. The opinion in the case did not indicate what the judgment to be entered herein would provide with respect to costs, and Rule 32 makes no express provision as to costs in the event of the "vacating" of a decree of a lower court, so that it was necessary to obtain a copy of

the judgment before counsel could determine as a certainty what the judgment provided with respect to costs. It was not reasonably possible to prepare, have printed, and serve a motion to modify the judgment between the time that counsel received the copy of the judgment (even though seasonably requested by them of the Clerk and promptly furnished by him) and the date—May 11, 1942, —when the Court adjourned until May 25, 1942. Consequently, respondent respectfully asks that the issuance of the mandate be stayed until the Court on May 25, 1942, or thereafter, disposes of the motion to modify the judgment.

6. On the merits of the motion to modify the judgment by eliminating therefrom the provision that the petitioners recover costs from the respondent, we respectfully call the Court's attention to the fact that the petitioners resisted the trial of the similar case in the state court. The respondent's parent corporation, Dean Milk Company, commenced an action in the Circuit Court of Cook County, Illinois, on May 15, 1940, following the passage of the Illinois Milk Pasteurization Plant Act of 1939, which this Court holds in its opinion should first be construed by the state court before the instant case is decided by the United States District Court. (We refer the Court to the "Joint Statement of Counsel Concerning Case of *Dean Milk Company, an Illinois Corporation, v. City of Chicago, a Municipal Corporation, et al.*, in Circuit Court of Cook County, Illinois and Appellate Court of Illinois, First District" filed in this cause at the request of this Honorable Court, which for convenience, we shall designate as the "Joint Statement").

7. The Dean Milk Company complaint in the state court referred to the 1939 statute (Joint Statement, p. 5)

and attached a copy of it as Exhibit "B" to the complaint (Joint Statement, p. 23).

8. In opposition to the issuance of an injunction in the state court proceeding and in denial of the existence of any emergency justifying injunctive relief, the petitioners (then the defendants), set forth at length the Federal court proceedings (Joint Statement, pp. 38-40).

9. The injunction having been entered by the state court (Joint Statement, pp. 44-46), petitioners appealed to the Illinois Appellate Court and in support of a motion to stay the operation of the trial court's injunction filed written suggestions under oath stating, among other things, that the trial court should not have entered the injunction because of the pendency of the proceedings in the United States District Court (Joint Statement, p. 49).

10. Upon reversal pursuant to confession of error, the petitioners also moved the Appellate Court to direct the trial court to stay proceedings until the determination of the Federal court case (Joint Statement, p. 50) and filed written suggestions in support thereof urging that the pendency of the Federal court case, etc., "should now persuade this honorable court, on this chancery appeal, to stay proceedings in this cause until the litigation in the Federal court can be determined". (Joint Statement, p. 51). This motion was denied (Joint Statement, p. 54).

11. Upon remandment of the state court case to the trial court, the petitioners on June 25, 1940, filed a motion and petition that the trial court stay proceedings in that case pending the disposition of the case in the Federal court (Joint Statement, pp. 54-57).

12. Thereafter, the decree of the Federal district court was entered and an appeal was taken by petitioners to the Circuit Court of Appeals. At no time did petitioners

move, suggest or intimate before the Master or before the District Court that the Federal court should withhold action pending decision of any question by the state court. Nor did the petitioners seek to test the validity or construction of its ordinance in the state courts by proceeding against other dairies selling milk in paper bottles not protected by the District Court's injunction. This was conceded by the City's counsel during the oral argument before this Honorable Court on March 31, 1942, in response to a question by Mr. Justice Black.

13. On March 3, 1941, this Court filed its opinion in *Railroad Commission of Texas* v. *The Pullman Company*, 312 U. S. 496. The appeal in this case was then pending undetermined in the Circuit Court of Appeals. The petitioners did not suggest in any brief filed in that Court, nor upon the oral argument which took place there in May, 1941, nor by petition for rehearing following an adverse decision rendered August 4, 1941, that the Federal court should in the exercise of discretion, or otherwise, stay its hand pending a decision of any question by the state court.

14. Upon the oral argument in this Honorable Court, the petitioners expressly asked the Court to decide on their merits the issues here presented.

15. The decision of the case which the Court made was, therefore, one not requested by any litigant but is based upon the broad grounds of policy enunciated in the opinion of the Court. Under this circumstance, we most respectfully suggest that the costs ought not to be taxed against the respondent, and that the judgment order should be modified (as permitted by Rule 32) by providing that neither party should recover costs against the other, or, in the alternative, by providing such other determination as to costs as to the Court shall seem meet.

16. Owing to the length of the record, the costs in the case are substantial and if taxed against the respondent will constitute a very heavy burden upon it. Because the decision of this case was not in favor of either party upon the merits, and because the incurring of costs was as much due to the unsuccessful desire of the petitioners to have the case determined by the Federal courts as it was due to the fact that respondent continued to prosecute this suit (then already pending) after the 1939 statute was enacted, respondent respectfully urges the Court to allow the relief here sought.

SUPREME COURT OF THE UNITED STATES.

No. 706 —, October Term, 1941.

CITY OF CHICAGO, a Municipal Corporation, Board of Health of the City of Chicago, *et al.*,

Petitioners,

v.

FIELDCREST DAIRIES, INC.

On writ of certiorari to the United States Circuit Court of Appeals for the Seventh Circuit.

This cause came on to be heard on the transcript of the record from the United States Circuit Court of Appeals for the Seventh Circuit, and was argued by counsel.

On consideration whereof, It is now here ordered and adjudged by this Court that the judgment of the said United States Circuit Court of Appeals, in this cause, be, and the same is hereby, vacated with costs; and that this cause be, and the same is hereby, remanded to the District Court of the United States for the Northern District of Illinois with directions to retain the bill pending a determination of proceedings in the state court in conformity with the opinion of this Court.

(Signed) WM. O. DOUGLAS.

April 27, 1942.

MR. JUSTICE ROBERTS concurs in the result.

Petitioners,

vs.

FIELDCREST DAIRIES, INC.,

Respondent.

MOTION BY THE STATE OF ILLINOIS, AS AMICUS CURIAE, FOR LEAVE TO PARTICIPATE IN THE ORAL ARGUMENT OF THE ABOVE ENTITLED CAUSE.

And now comes the STATE OF ILLINOIS, as *amicus curiae*, by GEORGE F. BARRETT, its Attorney General, and respectfully shows unto this Honorable Court the following:

1. That there is at this time pending and undetermined in this Court a certain cause entitled *City of Chicago, a Municipal Corporation, et al., Petitioners* v. *Fieldcrest Dairies, Inc., Respondent*, October 1941 Term, No. 706.

2. That perhaps the most important single issue which must necessarily be determined by this Court in its decision of the said case is whether or not the City of Chicago, a municipal corporation, located entirely within and being but a creature of the State of Illinois, may, after the enactment by the General Assembly of the State of Illinois of

an act clearly demonstrating that the public policy of the State is to authorize and legalize the use of "single service containers" in the sale and distribution of pasteurized milk throughout the entire State, thereafter enforce a local ordinance prohibiting entirely the use of such containers within the corporate limits of the City of Chicago.

3. That the issue above referred to involves a matter in which the State of Illinois, in its sovereign capacity, is not only vitally concerned but is desirous of sustaining the contention that such an ordinance is necessarily invalid as contrary to the public policy of the State respecting this same question and as limiting the applicability throughout the State of an act of the General Assembly.

4. That the State of Illinois has, simultaneously with the filing of this motion, filed with the Clerk of this Court forty (40) copies of a printed brief as *amicus curiae*, and has served copies of the said brief and of this motion upon the attorneys for the various parties to the above entitled cause.

5. That the Attorney General of the State of Illinois is of the opinion that this State's participation in the oral argument of the above entitled cause might assist this Court in its consideration of the said cause and might serve to clarify the issues before the Court in this litigation.

6. That counsel for the respondent have agreed to allocate twenty (20) minutes of the hour to which they would otherwise be entitled, to the State of Illinois for argument as such *amicus curiae*, provided such an arrangement is expressly sanctioned by order of this Court.

7. That the oral argument of the said cause has been set for Monday, March 30, A. D. 1942, and that it appears as the second case on the call for that day.

WHEREFORE, the STATE OF ILLINOIS, as *amicus curiae* herein, moves for the entry of an order granting leave to

it to participate in the oral argument of the above entitled cause, and allocating to it twenty (20) minutes out of the hour to which counsel for the respondent would otherwise be entitled.

George F. Barrett

Attorney General of the State of Illinois, Amicus Curiae.

AFFIDAVIT.

STATE OF ILLINOIS, } ss.
COUNTY OF COOK. }

ALBERT E. HALLETT, being first duly sworn, on his oath deposes and says that he is a member of the bar of this Court and Assistant Attorney General of the State of Illinois; that in such capacity he is in personal charge of the handling of the above entitled matter before this Court insofar as the said State is concerned; that he has read the foregoing motion; and that the facts therein set forth are true.

Albert E. Hallett

BRIEF OF AMICUS CURIAE, THE STATE OF ILLINOIS.

STATEMENT.

The STATE OF ILLINOIS, by GEORGE F. BARRETT, Attorney General, appears as *amicus curiae* pursuant to Paragraph 9 of Rule 27 of this Court. The law of Illinois relating to the powers and duties of the Attorney General in the premises is stated in the case of the *People ex rel. George F. Barrett, Attorney General, Petitioner,* v. *Philip J. Finnegan, Judge of the Circuit Court of Cook County, Respondent,* (1941) 378 Ill. 387, as follows:

"The office of Attorney General, as it existed at the common law, is one of ancient origin. He was the

only law officer of the Crown. (4 Reeves Hist. Eng. Law, chap. 25, p. 122.) The prerogatives which pertained to the Crown of England under the common law, in this country are vested in the people and the necessity for the existence of a public officer charged with the protection of public rights and the enforcement of public duties, by proper proceedings in the courts of justice, is just as imperative here as there.

"In this State the constitution, by creating the office of Attorney General under its well-known common law designation and providing that he shall perform such duties as may be prescribed by law, ingrafted upon the office all the powers and duties of an Attorney General as known at the common law, and gave the General Assembly power to confer additional powers and impose additional duties upon him. The legislature cannot, however, strip him of any of his common law powers and duties as the legal representative of the State. (*Fergus* v. *Russel*, 270 Ill. 304.) * * * As chief law officer of the State he may exercise all such power and authority as public interest may from time to time require. He may institute, conduct and maintain all such suits and proceedings as he deems necessary for the enforcement of the laws of the State, the preservation of order and the protection of public rights. (*Ex parte Young*, 209 U. S. 123, 28 Sup. Ct. 441, 52 L. ed. 714.)"

The reason for appearance of *amicus curiae* is to invite the Court's attention to the fact that the issues presented by the parties to this cause involve an important public question that affects the public interests of the People of the State of Illinois, and to request that the Court abstain from any action in this cause which may impinge the authority of the State by limiting the general application throughout the State of an Act of the General Assembly.

ARGUMENT.

It is our position that the question presented is whether the City has the power, under the statutes in question, to outlaw that which the State has legalized. We say this is the controlling question in this case; that the principles decisive of the question are settled in Illinois; and that the question is one of local law. Should the City's contention in this regard be sustained, the effect would be to impinge the power of the State and limit the application of an Act of the General Assembly by preventing its operation within the territory of the City which is within the territorial jurisdiction of the State.

The City contends that by virtue of Article 5 of the Illinois Cities and Villages Act, the pertinent provisions of which are set forth in Petitioner's Brief at p. 13, it has authority to prohibit, by ordinance, the use of single service milk containers in the sale and distribution of pasteurized milk within the City; and that this power was not affected by any of the provisions of the "Illinois Milk Pasteurization Plant Law" of 1939, which statute is set forth in full at p. 80 *et seq.* of Petitioners' Brief as Appendix "A".

For the purpose of this argument, we shall assume that the term "standard milk bottle" as used in the ordinance means what the Master said it did, viz.: "a glass bottle of the type, shape and proportions well-known to the trade and the community in Chicago as having been used for many years for the delivery of milk at retail." It is conceded for the purpose of this argument that the City had the power by virtue of the general provisions above noted, which are contained in Article 5 of the Cities and Villages Act of Illinois to prohibit the use of single service milk

containers in the sale and distribution of pasteurized milk in the City of Chicago, prior to the adoption of the "Illinois Milk Pasteurization Plant Law", and the specific approval, by the Director of the Department of Public Health of the State, of a pasteurization plant and single service containers used and filled therein.

An examination of the provisions of the "Illinois Milk Pasteurization Plant Law" of 1939 will show that the State has recalled certain of the powers theretofore conferred upon cities by the provisions of Article 5 of the Cities and Villages Act with reference to regulating the pasteurization of milk and the packaging, sale and distribution of pasteurized milk. The Act of 1939 requires that any person operating a pasteurization plant who distributes, delivers or sells pasteurized milk, or pasteurized milk products for consumption in the State of Illinois shall annually make application to the Department for a Certificate of Approval. Section 3 of the Act provides,

> "Any person who is hereafter engaged in operating a pasteurization plant for the purposes of distributing, delivering, or selling pasteurized milk or pasteurized milk products for consumption in the State of Illinois shall before engaging in such business make application to the Department for a Certificate of Approval."

Section 4 requires that upon receipt of such application, the Department shall make an inspection of the pasteurization plant, and, in the event the plant, equipment and methods of operation are found to comply with the provisions of the Act, the Director shall issue a Certificate of Approval upon payment of the required fee as is in the Act provided. Section 6 provides that any person operating a pasteurization plant shall, at any time, allow the Department to inspect such plant and take such samples as may be deemed necessary by the Department. Section 7 provides for the labeling of all "bottles, cans, packages and other containers enclosing milk or any milk product

defined in this Act." Section 8 requires that all pasteurized milk and milk products shall be placed in their final milk containers at the plant in which they are pasteurized and makes it unlawful for hotels, soda fountains, restaurants, grocery stores, milk depots, milk stations and similar establishments to sell or serve any pasteurized milk or milk products except in the original container in which it was placed at the point of pasteurization, provided that this requirement shall not apply to milk or milk products consumed on the premises, which may be served from the original container or from a dispenser approved by the Department for such purpose. This Section also prohibits the sale or distribution of bulk, loose or dipped pasteurized milk even though it has been heated as required by the Act.

This much of the Act makes it apparent that the Legislature intended to provide a law investing the State Department of Public Health with the power and duty to regulate the pasteurization of milk and milk products and the packaging, distributing and selling of pasteurized milk products. The statute authorizes the Department to inspect not only the pasteurization plant but also the *equipment and methods of operation.* With respect to "methods of operation", the statute provides that all pasteurized milk or milk products shall be placed in their final delivery container in the plant in which they are pasteurized. The Section so providing makes it unlawful for hotels and similar establishments as well as grocery stores and other retail distributing establishments to sell or serve any pasteurized milk or milk products except in the original container in which it was placed at the point of pasteurization. How could the Legislature any more clearly evidence an intent that milk which is pasteurized in a pasteurization plant approved by the State Department of Public Health, placed in containers in said plant, which containers are approved by the Department of Public Health, and which

must be sold in said original containers, may be sold in said containers at any place in the State of Illinois?

Item 10 of Section 15 of the Act provides in part,

> "Single service containers, caps, gaskets and similar articles shall be manufactured and transported in a sanitary manner."

Item 18 of the same Section provides:

> "Bottling or packaging of milk and milk products shall be done at the place of pasteurization by approved mechanical equipment."

It thus appears that the Legislature intended that the Department of Health of the State of Illinois would have the power to approve the use of single service containers that conformed with the requirements of the Act. In short the policy of the legislature as expressed in the entire Act is to legalize the distribution and sale of pasteurized milk in single service containers for consumption in the State of Illinois, and not merely in the part of the State of Illinois lying outside of the City of Chicago, provided the milk is pasteurized and packaged in a plant and in containers approved and licensed by the Depagtment of Public Health.

As was stated in the opinion of the Circuit Court of Appeals in this case:

> "The authorities are uniform that any ordinance which conflicts with any statute or public policy adopted by the State Legislature is invalid. The rule is aptly stated in 2 McQuillin on Municipal Corporations, 572:
>
> > 'A municipal corporation cannot, without special authority prohibit what the policy of a general statute permits. Nor, on the other hand, can an ordinance permit that which the State's policy forbids. Consequently under a general grant of power, a Municipal Corporation cannot adopt ordinances "which infringe the spirit, or are repugnant to the policy of the State as declared in its legislation." It thus follows that if the State

> has expressed through legislation a public policy with reference to a subject, a municipality cannot ordain in respect to the subject to an effect contrary to, or in qualification of the public policy so established. * * *"

"Such rule has been recognized by the Illinois courts. *City of Chicago* v. *Union Ice Cream Mfg. Co.*, 252 Ill. 311; 315; *City of Chicago* v. *Drogasawacz*, 256 Ill. 34, 37; *City of Mirango* v. *Roland*, 263 Ill. 531, 534. In the *Marengo* case, the Court said:

> 'Municipal authorities, under a general grant of power, cannot adopt ordinances which infringe the spirit of a State law or are repugnant of the general policy of the State. * * *'"

Section 19 of the Act of 1939 provides:

> "Nothing in this act shall impair or abridge the power of any city, village or incorporated town to regulate the handling, processing, labeling, sale or distribution of pasteurized milk, and pasteurized milk products, provided such regulation not permit any person to violate the provisions of this act."

It is submitted there is nothing in this section that might properly be interpreted as authorizing the city to outlaw the containers that the State has legalized for use within the state, in accordance with the express provisions of the Act.

At the trial it was stipulated (R. 695-6) that if S. V. Layson were called as a witness and duly sworn and testified in this cause, he would testify as follows:

> "That he is Milk Sanitarian of the Department of Public Health of the State of Illinois with offices at Springfield, Illinois; that the Department of Public Health of the State of Illinois by or under the direction of the affiant has made an inspection of the plant of Fieldcrest Dairies, Inc., located in the village of Chemung, McHenry County, Illinois, approximately 76 miles from the City of Chicago, Illinois, and that said plant and its equipment and apparatus have been approved by the Department of Health of the State of Illinois as complying with the laws and regulations

of said state pertaining to milk plants selling liquid milk and cream to the public at wholesale and retail; that on or about November 17, 1938, the Department of Public Health of the State of Illinois issued its Certificate No. 395 for the calendar years 1938, and on or about January 18, 1939, issued its Certificate No. 59 for the calendar year 1939, which latter certificate, duly sealed with the seal of the Department of Public Health of the State of Illinois and signed by A. C. Baxter, Acting Director of Public Health of the State of Illinois, is now in full force and effect, and that the language of said certificate last mentioned is substantially as follows:

> 'The State Department of Public Health considers that the construction and equipment of the pasteurization plant is such that with proper maintenance and operation, the pasteurized milk or milk products will be safe for human consumption. The continued safety of the pasteurized milk or milk products depends upon the continuous proper maintenance and operation of the plant, the responsibility for which rests with the management of said plant.'

> "That the Department of Public Health of the State of Illinois, in reliance upon tests made by the Department of Dairy Husbandry of the University of Illinois by or under the direction of Dr. M. J. Prucha, which tests have been accepted and relied upon by the said Department of Health, has approved the paper 'Pure-Pak' container for the sale of liquid milk and milk products to the public in the State of Illinois; that the Department of Public Health of the State of Illinois has inspected the pasteurization plant and also the Ex-Cell-O 'Pure-Pak' machine located in the plant of the Fielderest Dairy at Chemung, Illinois, and has approved the same."

It thus appears as a fact that the single service milk containers in question, as well as the plant and method of operation, etc. that are involved in the question, were approved and licensed by the State Department of Public Health under the authority of the Statute.

Counsel for Petitioners rely upon the case of *City of Geneseo* v. *Illinois Northern Utilities Company*, 378 Ill. 506. They claim that this case is decisive of the question here presented, but their claim is not supported by the case. In that case the claim was made that the Public Utilities Act of Illinois had the effect of recalling from Municipal Corporations within the State the power granted under Article 5 of the Cities and Villages Act to "regulate the locating, constructing or laying a track * * * in any street, alley or public place." The Court in that opinion held that the Public Utilities Act gave to the Commerce Commission of Illinois general supervision over utilities but that this grant of power did not affect the power of the City to control the occupancy of its streets. The power of the Commerce Commission to regulate utilities is separate and distinct from the power of cities to control the occupancy of their streets and the decision in that case has no application to the question here presented.

Another case relied upon by the City of Chicago is the case of *City of Ottawa* v. *Brown*, 372 Ill. 468. In that case the Legislature adopted, "An Act to regulate the storage, transportation, sale and use of gasoline and volatile oils," which became effective July 1, 1919. The Act contained the following provision, "Except in cities or villages where regulatory ordinances upon the subject are in full force and effect, the Department of Trade and Commerce shall have power to make and adopt reasonable rules and regulations governing the keeping, storage, transportation, selling or use of gasoline and volatile oil." When this statute took effect, the City had in force an ordinance regulating the storage of gasoline, which ordinance was adopted pursuant to the powers granted by Article 5 of the Cities and Villages Act. The Court held that the City had sufficiently exercised the power granted by the general statute to enable it either to amend its ordinance or to adopt a

broader one. The decision of the Court in this case has no bearing on the question here presented.

For the reasons stated, we respectfully submit that a decision sustaining the contention of the City of Chicago would be contrary to the law of the State of Illinois and would limit the general application throughout the State of an Act of the General Assembly.

Respectfully submitted,

GEORGE F. BARRETT,
Attorney General of the State of Illinois,
Springfield, Illinois,
Attorney for Amicus Curiae.

Albert E. Hallett,
Assistant Attorney General,
Of Counsel.

SUPREME COURT OF THE UNITED STATES.

No. 706.—October Term, 1941.

City of Chicago, A Municipal Corporation, Board of Health of the City of Chicago, et al., Petitioners,
vs.
Fieldcrest Dairies, Inc.

On Writ of Certiorari to the United States Circuit Court of Appeals for the Seventh Circuit.

[April 27, 1942.]

Mr. Justice Douglas delivered the opinion of the Court.

Respondent, a Michigan corporation authorized to do business in Illinois, sells milk to wholesalers and retailers in various cities in the vicinity of Chicago. By an ordinance passed on January 4, 1935, the City of Chicago required that milk or milk products "sold in quantities of less than one gallon shall be delivered in standard milk bottles." § 3094. Respondent sought a permit from petitioner Board of Health to sell milk in "Pure-Pak" paper containers in that city. That permit was not granted. Thereafter respondent filed suit against petitioners in the United States District Court for the Northern District of Illinois alleging, *inter alia*, that its "single service, sterile, sanitary and non-absorbent" containers are "standard milk bottles" within the meaning of the Chicago ordinance; that if the ordinance is construed as prohibiting respondent from using its paper containers the ordinance is unconstitutional and invalid under the federal and state constitutions; and that the refusal of the permit has and will cause respondent irreparable damage. The complaint prayed for a declaratory judgment that the ordinance be construed so as not to prohibit respondent from using its containers or, in the alternative, that the ordinance insofar as it does prevent such use is unconstitutional and invalid. Issue was joined. In May, 1939, the District Court referred the cause to a master who held extended hearings. In July, 1939, the so-called Illinois Milk Pasteurization Plant Law (L. 1939, pp. 660-666; Rev. Stat. 1941, c. 56½, §§ 115-134) was enacted, containing certain provisions regulating the use of single service and paper containers (§ 15) and reserving to cities, villages and incorporated

towns the power to regulate the distribution, etc. "of pasteurized milk and pasteurized milk products, provided that such regulation not permit any person to violate any provisions of this Act." § 19. On April 27, 1940, the master submitted his report finding that respondent's paper containers were not "standard milk bottles" within the meaning of the ordinance and that the ordinance as construed was valid and constitutional. In October, 1940, the District Court, on exceptions to the master's report, held that respondent's containers were "standard milk bottles" within the meaning of the ordinance. And it went on to hold that under the Milk Pasteurization Plant Law the city was without power to prohibit the use of such containers. It entered a decree in accordance with that finding and enjoined petitioners from interfering with respondent in the sale and delivery of milk and milk products in those containers. 35 F. Supp. 451. On appeal to the Circuit Court of Appeals, that court held that the District Court erred in holding that respondent's containers were "standard milk bottles" within the meaning of the ordinance. But it concluded that the ordinance insofar as it prohibited, rather than regulated, the use of paper containers was invalid by reason of the state Act. And it went on to intimate by way of *obiter dictum* that if the ordinance were construed to prohibit the use of respondent's containers it would not survive as a constitutional exercise of the police power. 122 F. 2d 132.

On May 15, 1940, while the cause was pending before the District Court, Dean Milk Company, of which respondent is a wholly owned subsidiary, instituted an action in the Illinois state court against petitioners and other city officials raising substantially the same issues and seeking substantially the same relief as respondent raised and sought in the federal court. After judgment had been rendered by the District Court in this case and while the appeal was pending, Dean Milk Company moved in the state court for a decree granting the relief prayed for and retaining jurisdiction by the state court pending final determination of the appeal in this case. Such a decree was entered by the state court in December 1940.

We granted the petition for certiorari because of the doubtful propriety of the District Court and of the Circuit Court of Appeals in undertaking to decide such an important question of Illinois law instead of remitting the parties to the state courts for

litigation of the state questions involved in the case. *Railroad Commission* v. *Pullman Co.*, 312 U. S. 496.

We are of the opinion that the procedure which we followed in the *Pullman* case should be followed here. Illinois has the final say as to the meaning of the ordinance in question. It also has the final word on the alleged conflict between the ordinance and the state Act. The determination which the District Court, the Circuit Court of Appeals or we might make could not be anything more than a forecast—a prediction as to the ultimate decision of the Supreme Court of Illinois. Here as in the *Pullman* case "a federal court of equity is asked to decide an issue by making a tentative answer which may be displaced tomorrow by a state adjudication." 312 U. S. p. 500. Furthermore, the dispute in its broad reach involves a question as to whether a city has trespassed on the domain of a State. Though that issue was not in the case when the complaint was filed, it emerged, due to the passage of the Milk Pasteurization Plant Law, long before the District Court entered its decree. The delicacy of that issue and an appropriate regard "for the rightful independence of state governments" (*Beal* v. *Missouri Pacific R. Co.*, 312 U. S. 45, 50) reemphasize that it is a wise and permissible policy for the federal chancellor to stay his hand in absence of an authoritative and controlling determination by the state tribunals. As we said in the *Pullman* case, "The resources of equity are equal to an adjustment that will avoid the waste of a tentative decision" and any "needless friction with state policies." See p. 500 and cases cited; *Thompson* v. *Magnolia Petroleum Co.*, 309 U. S. 478, 483-484. It is an exercise of a "sound discretion, which guides the determination of courts of equity". *Beal* v. *Missouri Pacific R. Co.*, *supra*, p. 50. In this case that discretion calls for a remission of the parties to the state courts which alone can give a definitive answer to the major questions posed. Plainly they constitute the more appropriate forum for the trial of those issues. See 54 Harv. L. Rev. 1379. Considerations of delay, inconvenience, and cost to the parties, which have been urged upon us, do not call for a different result. For we are here concerned with the much larger issue as to the appropriate relationship between federal and state authorities functioning as a harmonious whole.

The desirability of the course which we have suggested is not embarrassed by any question as to whether ready recourse may

be had to the state courts. The availability of the state tribunal is obvious, since a case involving substantially identical issues and brought by respondent's parent corporation is pending in the state court. Cf. *Gilchrist* v. *Interborough Rapid Transit Co.*, 279 U. S. 159.

It is of course true that respondent sought to raise in its complaint a constitutional issue—an issue which lurks in the case even though it not be deemed substantial. But here, as in the *Pullman* case, that issue may not survive the litigation in the state courts. If it does not, the litigation is at an end. That again indicates the wisdom of allowing the local law issues first to be resolved by those who have the final say. Avoidance of constitutional adjudications where not absolutely necessary is part of the wisdom of the doctrine of the *Pullman* case.

We therefore vacate the judgment and remand the cause to the District Court with directions to retain the bill pending a determination of proceedings in the state court in conformity with this opinion.

It is so ordered.

Mr. Justice ROBERTS concurs in the result.

A true copy.
